Public attributes

- `axes.transData` - transform data coords to display coords
- `axes.transAxes` - transform axis coords to display coords
- `labelpad` - number of points between the axis and its label

Init the axis with the parent Axes instance

```
class matplotlib.axis.XAxis(axes, pickradius=15)
```

Init the axis with the parent Axes instance

```
class matplotlib.axis.YAxis(axes, pickradius=15)
```

Init the axis with the parent Axes instance

```
class matplotlib.axis.Ticker
```

---

*Axis.cla*

clear the current axis

---

*Axis.get\_scale*

---

### matplotlib.axis.Axis.cla

```
Axis.cla()
```

clear the current axis

### matplotlib.axis.Axis.get\_scale

```
Axis.get_scale()
```

## Formatters and Locators

<code>Axis.get_major_formatter</code>	Get the formatter of the major ticker
<code>Axis.get_major_locator</code>	Get the locator of the major ticker
<code>Axis.get_minor_formatter</code>	Get the formatter of the minor ticker
<code>Axis.get_minor_locator</code>	Get the locator of the minor ticker
<code>Axis.set_major_formatter</code>	Set the formatter of the major ticker.
<code>Axis.set_major_locator</code>	Set the locator of the major ticker.
<code>Axis.set_minor_formatter</code>	Set the formatter of the minor ticker.
<code>Axis.set_minor_locator</code>	Set the locator of the minor ticker.

### matplotlib.axis.Axis.get\_major\_formatter

`Axis.get_major_formatter()`  
Get the formatter of the major ticker

### matplotlib.axis.Axis.get\_major\_locator

`Axis.get_major_locator()`  
Get the locator of the major ticker

### matplotlib.axis.Axis.get\_minor\_formatter

`Axis.get_minor_formatter()`  
Get the formatter of the minor ticker

### matplotlib.axis.Axis.get\_minor\_locator

`Axis.get_minor_locator()`  
Get the locator of the minor ticker

### matplotlib.axis.Axis.set\_major\_formatter

`Axis.set_major_formatter(formatter)`  
Set the formatter of the major ticker.

#### Parameters

**formatter** [`~matplotlib.ticker.Formatter`]

#### Examples using `matplotlib.axis.Axis.set_major_formatter`

- `sphx_glr_gallery_pyplots_dollar_ticks.py`

**matplotlib.axis.Axis.set\_major\_locator**

`Axis.set_major_locator(locator)`  
 Set the locator of the major ticker.

**Parameters**

**locator** [~matplotlib.ticker.Locator]

Examples using `matplotlib.axis.Axis.set_major_locator`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_filled\_step.py

**matplotlib.axis.Axis.set\_minor\_formatter**

`Axis.set_minor_formatter(formatter)`  
 Set the formatter of the minor ticker.

**Parameters**

**formatter** [~matplotlib.ticker.Formatter]

Examples using `matplotlib.axis.Axis.set_minor_formatter`

- sphx\_glr\_gallery\_pyplots\_pyplot\_scales.py

**matplotlib.axis.Axis.set\_minor\_locator**

`Axis.set_minor_locator(locator)`  
 Set the locator of the minor ticker.

**Parameters**

**locator** [~matplotlib.ticker.Locator]

**Axis Label**

<code>Axis.set_label_coords</code>	Set the coordinates of the label.
<code>Axis.set_label_position</code>	Set the label position (top or bottom)
<code>Axis.set_label_text</code>	Set the text value of the axis label.
<code>Axis.get_label_position</code>	Return the label position (top or bottom)
<code>Axis.get_label_text</code>	Get the text of the label

**matplotlib.axis.Axis.set\_label\_coords**

`Axis.set_label_coords(x, y, transform=None)`  
 Set the coordinates of the label. By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coordinate of the x label.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc

#### Examples using `matplotlib.axis.Axis.set_label_coords`

- sphx\_glr\_gallery\_pyplots\_align\_ylabels.py

#### `matplotlib.axis.Axis.set_label_position`

`Axis.set_label_position(position)`  
Set the label position (top or bottom)

##### Parameters

**position** [{'top', 'bottom'}]

#### `matplotlib.axis.Axis.set_label_text`

`Axis.set_label_text(label, fontdict=None, **kwargs)`  
Set the text value of the axis label.

ACCEPTS: A string value for the label

#### `matplotlib.axis.Axis.get_label_position`

`Axis.get_label_position()`  
Return the label position (top or bottom)

#### `matplotlib.axis.Axis.get_label_text`

`Axis.get_label_text()`  
Get the text of the label

#### Ticks, tick labels and Offset text

<code>Axis.get_major_ticks</code>	get the tick instances; grow as necessary
<code>Axis.get_majorticklabels</code>	Return a list of Text instances for the major ticklabels
<code>Axis.get_majorticklines</code>	Return the major tick lines as a list of Line2D instances
<code>Axis.get_majorticklocs</code>	Get the major tick locations in data coordinates as a numpy array
<code>Axis.get_minor_ticks</code>	get the minor tick instances; grow as necessary

Continued on next page

Table 116 – continued from previous page

<code>Axis.get_minorticklabels</code>	Return a list of <code>Text</code> instances for the minor ticklabels
<code>Axis.get_minorticklines</code>	Return the minor tick lines as a list of <code>Line2D</code> instances
<code>Axis.get_minorticklocs</code>	Get the minor tick locations in data coordinates as a numpy array
<code>Axis.get_offset_text</code>	Return the axis offsetText as a <code>Text</code> instance
<code>Axis.get_tick_padding</code>	
<code>Axis.get_ticklabels</code>	Get the tick labels as a list of <code>Text</code> instances.
<code>Axis.get_ticklines</code>	Return the tick lines as a list of <code>Line2D</code> instances
<code>Axis.get_ticklocs</code>	Get the tick locations in data coordinates as a numpy array
<code>Axis.get_gridlines</code>	Return the grid lines as a list of <code>Line2D</code> instance
<code>Axis.grid</code>	Configure the grid lines.
<code>Axis.iter_ticks</code>	Iterate through all of the major and minor ticks.
<code>Axis.set_tick_params</code>	Set appearance parameters for ticks, ticklabels, and gridlines.
<code>Axis.axis_date</code>	Sets up x-axis ticks and labels that treat the x data as dates.

### matplotlib.axis.Axis.get\_major\_ticks

`Axis.get_major_ticks(numticks=None)`  
 get the tick instances; grow as necessary

#### Examples using matplotlib.axis.Axis.get\_major\_ticks

- sphx\_glr\_gallery\_pyplots\_dollar\_ticks.py

### matplotlib.axis.Axis.get\_majorticklabels

`Axis.get_majorticklabels()`  
 Return a list of `Text` instances for the major ticklabels

### matplotlib.axis.Axis.get\_majorticklines

`Axis.get_majorticklines()`  
 Return the major tick lines as a list of `Line2D` instances

### matplotlib.axis.Axis.get\_majorticklocs

`Axis.get_majorticklocs()`  
 Get the major tick locations in data coordinates as a numpy array

**matplotlib.axis.Axis.get\_minor\_ticks**

`Axis.get_minor_ticks(numticks=None)`  
 get the minor tick instances; grow as necessary

**matplotlib.axis.Axis.get\_minorticklabels**

`Axis.get_minorticklabels()`  
 Return a list of `Text` instances for the minor ticklabels

**matplotlib.axis.Axis.get\_minorticklines**

`Axis.get_minorticklines()`  
 Return the minor tick lines as a list of `Line2D` instances

**matplotlib.axis.Axis.get\_minorticklocs**

`Axis.get_minorticklocs()`  
 Get the minor tick locations in data coordinates as a numpy array

**matplotlib.axis.Axis.get\_offset\_text**

`Axis.get_offset_text()`  
 Return the axis offsetText as a `Text` instance

**matplotlib.axis.Axis.get\_tick\_padding**

`Axis.get_tick_padding()`

**matplotlib.axis.Axis.get\_ticklabels**

`Axis.get_ticklabels(minor=False, which=None)`  
 Get the tick labels as a list of `Text` instances.

**Parameters**

**minor** [bool] If True return the minor ticklabels, else return the major ticklabels

**which** [None, ('minor', 'major', 'both')] Overrides `minor`.

Selects which ticklabels to return

**Returns**

**ret** [list] List of `Text` instances.

#### Examples using `matplotlib.axis.Axis.get_ticklabels`

- sphx\_glr\_gallery\_pyplots\_fig\_axes\_customize\_simple.py

#### `matplotlib.axis.Axis.get_ticklines`

`Axis.get_ticklines(minor=False)`

Return the tick lines as a list of `Line2D` instances

#### Examples using `matplotlib.axis.Axis.get_ticklines`

- sphx\_glr\_gallery\_pyplots\_fig\_axes\_customize\_simple.py

#### `matplotlib.axis.Axis.get_ticklocs`

`Axis.get_ticklocs(minor=False)`

Get the tick locations in data coordinates as a numpy array

#### `matplotlib.axis.Axis.get_gridlines`

`Axis.get_gridlines()`

Return the grid lines as a list of `Line2D` instance

#### `matplotlib.axis.Axis.grid`

`Axis.grid(b=None, which='major', **kwargs)`

Configure the grid lines.

##### Parameters

**b** [bool or None] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

**which** [{'major', 'minor', 'both'}] The grid lines to apply the changes on.

**\*\*kwargs** [`Line2D` properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

#### `matplotlib.axis.Axis.iter_ticks`

`Axis.iter_ticks()`

Iterate through all of the major and minor ticks.

**matplotlib.axis.Axis.set\_tick\_params**

`Axis.set_tick_params(which='major', reset=False, **kw)`  
 Set appearance parameters for ticks, ticklabels, and gridlines.

For documentation of keyword arguments, see `matplotlib.axes.Axes.tick_params()`.

**matplotlib.axis.Axis.axis\_date**

`Axis.axis_date(tz=None)`  
 Sets up x-axis ticks and labels that treat the x data as dates. `tz` is a `tzinfo` instance or a timezone string. This timezone is used to create date labels.

**Data and view intervals**

<code>Axis.get_data_interval</code>	return the Interval instance for this axis data limits
<code>Axis.get_view_interval</code>	return the Interval instance for this axis view limits
<code>Axis.set_data_interval</code>	set the axis data limits
<code>Axis.set_view_interval</code>	

**matplotlib.axis.Axis.get\_data\_interval**

`Axis.get_data_interval()`  
 return the Interval instance for this axis data limits

**matplotlib.axis.Axis.get\_view\_interval**

`Axis.get_view_interval()`  
 return the Interval instance for this axis view limits

**matplotlib.axis.Axis.set\_data\_interval**

`Axis.set_data_interval()`  
 set the axis data limits

**matplotlib.axis.Axis.set\_view\_interval**

`Axis.set_view_interval(vmin, vmax, ignore=False)`

**Rendering helpers**

---

<i>Axis.get_minpos</i>	
<i>Axis.get_tick_space</i>	Return the estimated number of ticks that can fit on the axis.
<i>Axis.get_ticklabel_extents</i>	Get the extents of the tick labels on either side of the axes.
<i>Axis.get_tightbbox</i>	Return a bounding box that encloses the axis.

---

#### **matplotlib.axis.Axis.get\_minpos**

`Axis.get_minpos()`

#### **matplotlib.axis.Axis.get\_tick\_space**

`Axis.get_tick_space()`  
Return the estimated number of ticks that can fit on the axis.

#### **matplotlib.axis.Axis.get\_ticklabel\_extents**

`Axis.get_ticklabel_extents(renderer)`  
Get the extents of the tick labels on either side of the axes.

#### **matplotlib.axis.Axis.get\_tightbbox**

`Axis.get_tightbbox(renderer)`  
Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and `offsetText`.

### **Interactive**

---

<i>Axis.get_pickradius</i>	Return the depth of the axis used by the picker
<i>Axis.set_pickradius</i>	Set the depth of the axis used by the picker.

---

#### **matplotlib.axis.Axis.get\_pickradius**

`Axis.get_pickradius()`  
Return the depth of the axis used by the picker

#### **matplotlib.axis.Axis.set\_pickradius**

`Axis.set_pickradius(pickradius)`  
Set the depth of the axis used by the picker.

### **Parameters**

**pickradius** [float]

## Units

---

<i>Axis.convert_units</i>	
<i>Axis.set_units</i>	set the units for axis
<i>Axis.get_units</i>	return the units for axis
<i>Axis.update_units</i>	introspect <i>data</i> for units converter and update the <code>axis.converter</code> instance if necessary.

---

### matplotlib.axis.Axis.convert\_units

`Axis.convert_units(x)`

### matplotlib.axis.Axis.set\_units

`Axis.set_units(u)`

set the units for axis

ACCEPTS: a units tag

### matplotlib.axis.Axis.get\_units

`Axis.get_units()`

return the units for axis

### matplotlib.axis.Axis.update\_units

`Axis.update_units(data)`

introspect *data* for units converter and update the `axis.converter` instance if necessary. Return *True* if *data* is registered for unit conversion.

## Incremental navigation

---

<i>Axis.pan</i>	Pan <i>numsteps</i> (can be positive or negative)
<i>Axis.zoom</i>	Zoom in/out on axis; if <i>direction</i> is >0 zoom in, else zoom out

---

### matplotlib.axis.Axis.pan

`Axis.pan(numsteps)`

Pan *numsteps* (can be positive or negative)

**matplotlib.axis.Axis.zoom**

`Axis.zoom(direction)`

Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

**YAxis Specific**

<code>YAxis.axis_name</code>	
<code>YAxis.get_text_widths</code>	
<code>YAxis.get_ticks_position</code>	Return the ticks position (left, right, both or unknown)
<code>YAxis.set_offset_position</code>	
<b>Parameters</b>	
<code>YAxis.set_ticks_position</code>	Set the ticks position (left, right, both, default or none) 'both' sets the ticks to appear on both positions, but does not change the tick labels.
<code>YAxis.tick_left</code>	Move ticks and ticklabels (if present) to the left of the axes.
<code>YAxis.tick_right</code>	Move ticks and ticklabels (if present) to the right of the axes.

**matplotlib.axis.YAxis.axis\_name**

`YAxis.axis_name = 'y'`

**matplotlib.axis.YAxis.get\_text\_widths**

`YAxis.get_text_widths(renderer)`

**matplotlib.axis.YAxis.get\_ticks\_position**

`YAxis.get_ticks_position()`

Return the ticks position (left, right, both or unknown)

**matplotlib.axis.YAxis.set\_offset\_position**

`YAxis.set_offset_position(position)`

**Parameters**

**position** [{'left', 'right'}]

**matplotlib.axis.YAxis.set\_ticks\_position**`YAxis.set_ticks_position(position)`

Set the ticks position (left, right, both, default or none) 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at left. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

**Parameters**

**position** [{'left', 'right', 'both', 'default', 'none'}]

**Examples using matplotlib.axis.YAxis.set\_ticks\_position**

- sphx\_glr\_gallery\_pyplots\_whats\_new\_99\_spines.py

**matplotlib.axis.YAxis.tick\_left**`YAxis.tick_left()`

Move ticks and ticklabels (if present) to the left of the axes.

**matplotlib.axis.YAxis.tick\_right**`YAxis.tick_right()`

Move ticks and ticklabels (if present) to the right of the axes.

**XAxis Specific**

<code>XAxis.axis_name</code>	
<code>XAxis.get_text_heights</code>	Returns the amount of space one should reserve for text above and below the axes.
<code>XAxis.get_ticks_position</code>	Return the ticks position (top, bottom, default or unknown)
<code>XAxis.set_ticks_position</code>	Set the ticks position (top, bottom, both, default or none) both sets the ticks to appear on both positions, but does not change the tick labels.
<code>XAxis.tick_bottom</code>	Move ticks and ticklabels (if present) to the bottom of the axes.
<code>XAxis.tick_top</code>	Move ticks and ticklabels (if present) to the top of the axes.

**matplotlib.axis.XAxis.axis\_name**`XAxis.axis_name = 'x'`

### matplotlib.axis.XAxis.get\_text\_heights

`XAxis.get_text_heights(renderer)`

Returns the amount of space one should reserve for text above and below the axes.  
Returns a tuple (above, below)

### matplotlib.axis.XAxis.get\_ticks\_position

`XAxis.get_ticks_position()`

Return the ticks position (top, bottom, default or unknown)

### matplotlib.axis.XAxis.set\_ticks\_position

`XAxis.set_ticks_position(position)`

Set the ticks position (top, bottom, both, default or none) both sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at bottom. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

#### Parameters

**position** [{'top', 'bottom', 'both', 'default', 'none'}]

#### Examples using matplotlib.axis.XAxis.set\_ticks\_position

- sphx\_glr\_gallery\_pyplots\_whats\_new\_99\_spines.py

### matplotlib.axis.XAxis.tick\_bottom

`XAxis.tick_bottom()`

Move ticks and ticklabels (if present) to the bottom of the axes.

### matplotlib.axis.XAxis.tick\_top

`XAxis.tick_top()`

Move ticks and ticklabels (if present) to the top of the axes.

#### Other

---

<code>Axis.OFFSETEXTPAD</code>	
<code>Axis.limit_range_for_scale</code>	
<code>Axis.reset_ticks</code>	Re-initialize the major and minor Tick lists.
<code>Axis.set_default_intervals</code>	set the default limits for the axis data and view interval if they are not mutated
<code>Axis.get_smart_bounds</code>	get whether the axis has smart bounds
<code>Axis.set_smart_bounds</code>	set the axis to have smart bounds

---

**matplotlib.axis.Axis.OFFSETEXTPAD**

```
Axis.OFFSETEXTPAD = 3
```

**matplotlib.axis.Axis.limit\_range\_for\_scale**

```
Axis.limit_range_for_scale(vmin, vmax)
```

**matplotlib.axis.Axis.reset\_ticks**

```
Axis.reset_ticks()
```

Re-initialize the major and minor Tick lists.  
Each list starts with a single fresh Tick.

**matplotlib.axis.Axis.set\_default\_intervals**

```
Axis.set_default_intervals()
```

set the default limits for the axis data and view interval if they are not mutated

**matplotlib.axis.Axis.get\_smart\_bounds**

```
Axis.get_smart_bounds()
```

get whether the axis has smart bounds

**matplotlib.axis.Axis.set\_smart\_bounds**

```
Axis.set_smart_bounds(value)
```

set the axis to have smart bounds

**Discouraged**

These methods implicitly use *FixedLocator* and *FixedFormatter*. They can be convenient, but if not used together may de-couple your tick labels from your data.

<i>Axis.set_ticklabels</i>	Set the text values of the tick labels.
<i>Axis.set_ticks</i>	Set the locations of the tick marks from sequence ticks

**matplotlib.axis.Axis.set\_ticklabels**

```
Axis.set_ticklabels(ticklabels, *args, minor=False, **kwargs)
```

Set the text values of the tick labels. Return a list of Text instances. Use *kwargs minor=True* to select minor ticks. All other *kwargs* are used to update the text object properties. As for *get\_ticklabels*, *label1* (left or bottom) is affected for a given tick only

if its `label1On` attribute is `True`, and similarly for `label2`. The list of returned label text objects consists of all such `label1` objects followed by all such `label2` objects.

The input `ticklabels` is assumed to match the set of tick locations, regardless of the state of `label1On` and `label2On`.

ACCEPTS: sequence of strings or Text objects

### matplotlib.axis.Axis.set\_ticks

`Axis.set_ticks(ticks, minor=False)`

Set the locations of the tick marks from sequence `ticks`

ACCEPTS: sequence of floats

### Examples using matplotlib.axis.Axis.set\_ticks

- `sphx_glr_gallery_pyplots_whats_new_99_spines.py`

## 18.8.3 Tick objects

```
class matplotlib.axis.Tick(axes, loc, label, size=None, width=None, color=None,
                           tickdir=None, pad=None, labelsz=None, label-
                           color=None, zorder=None, gridOn=None, tick1On=True,
                           tick2On=True, label1On=True, label2On=False,
                           major=True, labelrotation=0, grid_color=None,
                           grid_linestyle=None, grid_linewidth=None,
                           grid_alpha=None, **kw)
```

Abstract base class for the axis ticks, grid lines and labels

1 refers to the bottom of the plot for xticks and the left for yticks 2 refers to the top of the plot for xticks and the right for yticks

### Attributes

**tick1line** [Line2D]

**tick2line** [Line2D]

**gridline** [Line2D]

**label1** [Text]

**label2** [Text]

**gridOn** [bool] Determines whether to draw the tickline.

**tick1On** [bool] Determines whether to draw the first tickline.

**tick2On** [bool] Determines whether to draw the second tickline.

**label1On** [bool] Determines whether to draw the first tick label.

**label2On** [bool] Determines whether to draw the second tick label.

`bbox` is the `Bound2D` bounding box in display coords of the Axes `loc` is the tick location in data coords `size` is the tick size in points

```
class matplotlib.axis.XTick(axes, loc, label, size=None, width=None, color=None,
    tickdir=None, pad=None, labelsiz=None, label-
    color=None, zorder=None, gridOn=None, tick1On=True,
    tick2On=True, label1On=True, label2On=False,
    major=True, labelrotation=0, grid_color=None,
    grid_linestyle=None, grid_linewidth=None,
    grid_alpha=None, **kw)
```

Contains all the Artists needed to make an x tick - the tick line, the label text and the grid line

bbbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

```
class matplotlib.axis.YTick(axes, loc, label, size=None, width=None, color=None,
    tickdir=None, pad=None, labelsiz=None, label-
    color=None, zorder=None, gridOn=None, tick1On=True,
    tick2On=True, label1On=True, label2On=False,
    major=True, labelrotation=0, grid_color=None,
    grid_linestyle=None, grid_linewidth=None,
    grid_alpha=None, **kw)
```

Contains all the Artists needed to make a Y tick - the tick line, the label text and the grid line

bbbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

<i>Tick.apply_tickdir</i>	Calculate self._pad and self._tickmarkers
<i>Tick.get_loc</i>	Return the tick location (data coords) as a scalar
<i>Tick.get_pad</i>	Get the value of the tick label pad in points
<i>Tick.get_pad_pixels</i>	
<i>Tick.get_tick_padding</i>	Get the length of the tick outside of the axes.
<i>Tick.get_tickdir</i>	
<i>Tick.get_view_interval</i>	return the view Interval instance for the axis this tick is ticking
<i>Tick.set_label1</i>	Set the label1 text.
<i>Tick.set_label2</i>	Set the label2 text.
<i>Tick.set_pad</i>	Set the tick label pad in points
<i>Tick.update_position</i>	Set the location of tick in data coords with scalar <i>loc</i>

### matplotlib.axis.Tick.apply\_tickdir

```
Tick.apply_tickdir(tickdir)
    Calculate self._pad and self._tickmarkers
```

### matplotlib.axis.Tick.get\_loc

```
Tick.get_loc()
    Return the tick location (data coords) as a scalar
```

**matplotlib.axis.Tick.get\_pad**

`Tick.get_pad()`  
Get the value of the tick label pad in points

**matplotlib.axis.Tick.get\_pad\_pixels**

`Tick.get_pad_pixels()`

**matplotlib.axis.Tick.get\_tick\_padding**

`Tick.get_tick_padding()`  
Get the length of the tick outside of the axes.

**matplotlib.axis.Tick.get\_tickdir**

`Tick.get_tickdir()`

**matplotlib.axis.Tick.get\_view\_interval**

`Tick.get_view_interval()`  
return the view Interval instance for the axis this tick is ticking

**matplotlib.axis.Tick.set\_label1**

`Tick.set_label1(s)`  
Set the label1 text.

**Parameters**

**s** [str]

**matplotlib.axis.Tick.set\_label2**

`Tick.set_label2(s)`  
Set the label2 text.

**Parameters**

**s** [str]

**matplotlib.axis.Tick.set\_pad**

`Tick.set_pad(val)`  
Set the tick label pad in points

**Parameters**

**val** [float]

**matplotlib.axis.Tick.update\_position**`Tick.update_position(loc)`Set the location of tick in data coords with scalar *loc***18.8.4 Common and inherited methods**`XTick`

<code>XTick.apply_tickdir</code>	Calculate self._pad and self._tickmarkers
<code>XTick.get_loc</code>	Return the tick location (data coords) as a scalar
<code>XTick.get_pad</code>	Get the value of the tick label pad in points
<code>XTick.get_pad_pixels</code>	
<code>XTick.get_tick_padding</code>	Get the length of the tick outside of the axes.
<code>XTick.get_tickdir</code>	
<code>XTick.get_view_interval</code>	return the Interval instance for this axis view limits
<code>XTick.set_label1</code>	Set the label1 text.
<code>XTick.set_label2</code>	Set the label2 text.
<code>XTick.set_pad</code>	Set the tick label pad in points
<code>XTick.update_position</code>	Set the location of tick in data coords with scalar <i>loc</i>

**matplotlib.axis.XTick.apply\_tickdir**`XTick.apply_tickdir(tickdir)`

Calculate self.\_pad and self.\_tickmarkers

**matplotlib.axis.XTick.get\_loc**`XTick.get_loc()`

Return the tick location (data coords) as a scalar

**matplotlib.axis.XTick.get\_pad**`XTick.get_pad()`

Get the value of the tick label pad in points

**matplotlib.axis.XTick.get\_pad\_pixels**`XTick.get_pad_pixels()`

**matplotlib.axis.XTick.get\_tick\_padding**

`XTick.get_tick_padding()`  
Get the length of the tick outside of the axes.

**matplotlib.axis.XTick.get\_tickdir**

`XTick.get_tickdir()`

**matplotlib.axis.XTick.get\_view\_interval**

`XTick.get_view_interval()`  
return the Interval instance for this axis view limits

**matplotlib.axis.XTick.set\_label1**

`XTick.set_label1(s)`  
Set the label1 text.

**Parameters**

**s** [str]

**matplotlib.axis.XTick.set\_label2**

`XTick.set_label2(s)`  
Set the label2 text.

**Parameters**

**s** [str]

**matplotlib.axis.XTick.set\_pad**

`XTick.set_pad(val)`  
Set the tick label pad in points

**Parameters**

**val** [float]

**matplotlib.axis.XTick.update\_position**

`XTick.update_position(loc)`  
Set the location of tick in data coords with scalar *loc*

**YTick**

---

<i>YTick.apply_tickdir</i>	Calculate self._pad and self._tickmarkers
<i>YTick.get_loc</i>	Return the tick location (data coords) as a scalar
<i>YTick.get_pad</i>	Get the value of the tick label pad in points
<i>YTick.get_pad_pixels</i>	
<i>YTick.get_tick_padding</i>	Get the length of the tick outside of the axes.
<i>YTick.get_tickdir</i>	
<i>YTick.get_view_interval</i>	return the Interval instance for this axis view limits
<i>YTick.set_label1</i>	Set the label1 text.
<i>YTick.set_label2</i>	Set the label2 text.
<i>YTick.set_pad</i>	Set the tick label pad in points
<i>YTick.update_position</i>	Set the location of tick in data coords with scalar <i>loc</i>

---

**matplotlib.axis.YTick.apply\_tickdir**

`YTick.apply_tickdir(tickdir)`  
 Calculate self.\_pad and self.\_tickmarkers

**matplotlib.axis.YTick.get\_loc**

`YTick.get_loc()`  
 Return the tick location (data coords) as a scalar

**matplotlib.axis.YTick.get\_pad**

`YTick.get_pad()`  
 Get the value of the tick label pad in points

**matplotlib.axis.YTick.get\_pad\_pixels**

`YTick.get_pad_pixels()`

**matplotlib.axis.YTick.get\_tick\_padding**

`YTick.get_tick_padding()`  
 Get the length of the tick outside of the axes.

**matplotlib.axis.YTick.get\_tickdir**

`YTick.get_tickdir()`

**matplotlib.axis.YTick.get\_view\_interval**

`YTick.get_view_interval()`  
 return the Interval instance for this axis view limits

**matplotlib.axis.YTick.set\_label1**

`YTick.set_label1(s)`  
 Set the label1 text.

**Parameters**

**s** [str]

**matplotlib.axis.YTick.set\_label2**

`YTick.set_label2(s)`  
 Set the label2 text.

**Parameters**

**s** [str]

**matplotlib.axis.YTick.set\_pad**

`YTick.set_pad(val)`  
 Set the tick label pad in points

**Parameters**

**val** [float]

**matplotlib.axis.YTick.update\_position**

`YTick.update_position(loc)`  
 Set the location of tick in data coords with scalar *loc*

**YAxis**

---

<code>YAxis.OFFSETTEXTPAD</code>	
<code>YAxis.axis_date</code>	Sets up x-axis ticks and labels that treat the x data as dates.
<code>YAxis.cla</code>	clear the current axis
<code>YAxis.convert_units</code>	
<code>YAxis.get_data_interval</code>	return the Interval instance for this axis data limits
<code>YAxis.get_gridlines</code>	Return the grid lines as a list of Line2D instance
<code>YAxis.get_label_position</code>	Return the label position (top or bottom)

---

Continued on next page

Table 129 – continued from previous page

<code>YAxis.get_label_text</code>	Get the text of the label
<code>YAxis.get_major_formatter</code>	Get the formatter of the major ticker
<code>YAxis.get_major_locator</code>	Get the locator of the major ticker
<code>YAxis.get_major_ticks</code>	get the tick instances; grow as necessary
<code>YAxis.get_majorticklabels</code>	Return a list of Text instances for the major ticklabels
<code>YAxis.get_majorticklines</code>	Return the major tick lines as a list of Line2D instances
<code>YAxis.get_majorticklocs</code>	Get the major tick locations in data coordinates as a numpy array
<code>YAxis.get_minor_formatter</code>	Get the formatter of the minor ticker
<code>YAxis.get_minor_locator</code>	Get the locator of the minor ticker
<code>YAxis.get_minor_ticks</code>	get the minor tick instances; grow as necessary
<code>YAxis.get_minorticklabels</code>	Return a list of Text instances for the minor ticklabels
<code>YAxis.get_minorticklines</code>	Return the minor tick lines as a list of Line2D instances
<code>YAxis.get_minorticklocs</code>	Get the minor tick locations in data coordinates as a numpy array
<code>YAxis.get_minpos</code>	
<code>YAxis.get_offset_text</code>	Return the axis offsetText as a Text instance
<code>YAxis.get_pickradius</code>	Return the depth of the axis used by the picker
<code>YAxis.get_scale</code>	
<code>YAxis.get_smart_bounds</code>	get whether the axis has smart bounds
<code>YAxis.get_tick_padding</code>	
<code>YAxis.get_tick_space</code>	Return the estimated number of ticks that can fit on the axis.
<code>YAxis.get_ticklabel_extents</code>	Get the extents of the tick labels on either side of the axes.
<code>YAxis.get_ticklabels</code>	Get the tick labels as a list of <i>Text</i> instances.
<code>YAxis.get_ticklines</code>	Return the tick lines as a list of Line2D instances
<code>YAxis.get_ticklocs</code>	Get the tick locations in data coordinates as a numpy array
<code>YAxis.get_tightbbox</code>	Return a bounding box that encloses the axis.
<code>YAxis.get_units</code>	return the units for axis
<code>YAxis.get_view_interval</code>	return the Interval instance for this axis view limits
<code>YAxis.grid</code>	Configure the grid lines.
<code>YAxis.iter_ticks</code>	Iterate through all of the major and minor ticks.
<code>YAxis.limit_range_for_scale</code>	
<code>YAxis.pan</code>	Pan <i>numsteps</i> (can be positive or negative)
<code>YAxis.reset_ticks</code>	Re-initialize the major and minor Tick lists.
<code>YAxis.set_data_interval</code>	set the axis data limits
<code>YAxis.set_default_intervals</code>	set the default limits for the axis interval if they are not mutated
<code>YAxis.set_label_coords</code>	Set the coordinates of the label.

Continued on next page

Table 129 – continued from previous page

<code>YAxis.set_label_position</code>	Set the label position (left or right)
<code>YAxis.set_label_text</code>	Set the text value of the axis label.
<code>YAxis.set_major_formatter</code>	Set the formatter of the major ticker.
<code>YAxis.set_major_locator</code>	Set the locator of the major ticker.
<code>YAxis.set_minor_formatter</code>	Set the formatter of the minor ticker.
<code>YAxis.set_minor_locator</code>	Set the locator of the minor ticker.
<code>YAxis.set_pickradius</code>	Set the depth of the axis used by the picker.
<code>YAxis.set_smart_bounds</code>	set the axis to have smart bounds
<code>YAxis.set_tick_params</code>	Set appearance parameters for ticks, ticklabels, and gridlines.
<code>YAxis.set_ticklabels</code>	Set the text values of the tick labels.
<code>YAxis.set_ticks</code>	Set the locations of the tick marks from sequence ticks
<code>YAxis.set_units</code>	set the units for axis
<code>YAxis.set_view_interval</code>	If <i>ignore</i> is <i>False</i> , the order of <i>vmin</i> , <i>vmax</i> does not matter; the original axis orientation will be preserved.
<code>YAxis.update_units</code>	introspect <i>data</i> for units converter and update the <code>axis.converter</code> instance if necessary.
<code>YAxis.zoom</code>	Zoom in/out on axis; if <i>direction</i> is $>0$ zoom in, else zoom out

### matplotlib.axis.YAxis.OFFSETEXTPAD

`YAxis.OFFSETEXTPAD = 3`

### matplotlib.axis.YAxis.axis\_date

`YAxis.axis_date(tz=None)`

Sets up x-axis ticks and labels that treat the x data as dates. *tz* is a `tzinfo` instance or a timezone string. This timezone is used to create date labels.

### matplotlib.axis.YAxis.cla

`YAxis.cla()`

clear the current axis

### matplotlib.axis.YAxis.convert\_units

`YAxis.convert_units(x)`

### matplotlib.axis.YAxis.get\_data\_interval

`YAxis.get_data_interval()`

return the `Interval` instance for this axis data limits

**matplotlib.axis.YAxis.get\_gridlines**

`YAxis.get_gridlines()`  
Return the grid lines as a list of Line2D instance

**matplotlib.axis.YAxis.get\_label\_position**

`YAxis.get_label_position()`  
Return the label position (top or bottom)

**matplotlib.axis.YAxis.get\_label\_text**

`YAxis.get_label_text()`  
Get the text of the label

**matplotlib.axis.YAxis.get\_major\_formatter**

`YAxis.get_major_formatter()`  
Get the formatter of the major ticker

**matplotlib.axis.YAxis.get\_major\_locator**

`YAxis.get_major_locator()`  
Get the locator of the major ticker

**matplotlib.axis.YAxis.get\_major\_ticks**

`YAxis.get_major_ticks(numticks=None)`  
get the tick instances; grow as necessary

**matplotlib.axis.YAxis.get\_majorticklabels**

`YAxis.get_majorticklabels()`  
Return a list of Text instances for the major ticklabels

**matplotlib.axis.YAxis.get\_majorticklines**

`YAxis.get_majorticklines()`  
Return the major tick lines as a list of Line2D instances

**matplotlib.axis.YAxis.get\_majorticklocs**

`YAxis.get_majorticklocs()`  
Get the major tick locations in data coordinates as a numpy array

**matplotlib.axis.YAxis.get\_minor\_formatter**

`YAxis.get_minor_formatter()`  
Get the formatter of the minor ticker

**matplotlib.axis.YAxis.get\_minor\_locator**

`YAxis.get_minor_locator()`  
Get the locator of the minor ticker

**matplotlib.axis.YAxis.get\_minor\_ticks**

`YAxis.get_minor_ticks(numticks=None)`  
get the minor tick instances; grow as necessary

**matplotlib.axis.YAxis.get\_minorticklabels**

`YAxis.get_minorticklabels()`  
Return a list of Text instances for the minor ticklabels

**matplotlib.axis.YAxis.get\_minorticklines**

`YAxis.get_minorticklines()`  
Return the minor tick lines as a list of Line2D instances

**matplotlib.axis.YAxis.get\_minorticklocs**

`YAxis.get_minorticklocs()`  
Get the minor tick locations in data coordinates as a numpy array

**matplotlib.axis.YAxis.get\_minpos**

`YAxis.get_minpos()`

**matplotlib.axis.YAxis.get\_offset\_text**

`YAxis.get_offset_text()`  
Return the axis offsetText as a Text instance

**matplotlib.axis.YAxis.get\_pickradius**

`YAxis.get_pickradius()`  
Return the depth of the axis used by the picker

**matplotlib.axis.YAxis.get\_scale**

`YAxis.get_scale()`

**matplotlib.axis.YAxis.get\_smart\_bounds**

`YAxis.get_smart_bounds()`  
get whether the axis has smart bounds

**matplotlib.axis.YAxis.get\_tick\_padding**

`YAxis.get_tick_padding()`

**matplotlib.axis.YAxis.get\_tick\_space**

`YAxis.get_tick_space()`  
Return the estimated number of ticks that can fit on the axis.

**matplotlib.axis.YAxis.get\_ticklabel\_extents**

`YAxis.get_ticklabel_extents(renderer)`  
Get the extents of the tick labels on either side of the axes.

**matplotlib.axis.YAxis.get\_ticklabels**

`YAxis.get_ticklabels(minor=False, which=None)`  
Get the tick labels as a list of *Text* instances.

**Parameters**

**minor** [bool] If True return the minor ticklabels, else return the major ticklabels

**which** [None, ('minor', 'major', 'both')] Overrides `minor`.

Selects which ticklabels to return

**Returns**

**ret** [list] List of *Text* instances.

**matplotlib.axis.YAxis.get\_ticklines**

`YAxis.get_ticklines(minor=False)`  
Return the tick lines as a list of *Line2D* instances

**matplotlib.axis.YAxis.get\_ticklocs**

`YAxis.get_ticklocs(minor=False)`  
Get the tick locations in data coordinates as a numpy array

**matplotlib.axis.YAxis.get\_tightbbox**

`YAxis.get_tightbbox(renderer)`  
Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and `offsetText`.

**matplotlib.axis.YAxis.get\_units**

`YAxis.get_units()`  
return the units for axis

**matplotlib.axis.YAxis.get\_view\_interval**

`YAxis.get_view_interval()`  
return the Interval instance for this axis view limits

**matplotlib.axis.YAxis.grid**

`YAxis.grid(b=None, which='major', **kwargs)`  
Configure the grid lines.

**Parameters**

**b** [bool or None] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

**which** [{'major', 'minor', 'both'}] The grid lines to apply the changes on.

**\*\*kwargs** [*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

**matplotlib.axis.YAxis.iter\_ticks**

`YAxis.iter_ticks()`  
Iterate through all of the major and minor ticks.

**matplotlib.axis.YAxis.limit\_range\_for\_scale**

`YAxis.limit_range_for_scale(vmin, vmax)`

**matplotlib.axis.YAxis.pan**

`YAxis.pan(numsteps)`  
 Pan *numsteps* (can be positive or negative)

**matplotlib.axis.YAxis.reset\_ticks**

`YAxis.reset_ticks()`  
 Re-initialize the major and minor Tick lists.  
 Each list starts with a single fresh Tick.

**matplotlib.axis.YAxis.set\_data\_interval**

`YAxis.set_data_interval(vmin, vmax, ignore=False)`  
 set the axis data limits

**matplotlib.axis.YAxis.set\_default\_intervals**

`YAxis.set_default_intervals()`  
 set the default limits for the axis interval if they are not mutated

**matplotlib.axis.YAxis.set\_label\_coords**

`YAxis.set_label_coords(x, y, transform=None)`  
 Set the coordinates of the label. By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coordinate of the x label.  
 You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc

**matplotlib.axis.YAxis.set\_label\_position**

`YAxis.set_label_position(position)`  
 Set the label position (left or right)

**Parameters**

**position** [ {'left', 'right'} ]

**matplotlib.axis.YAxis.set\_label\_text**

`YAxis.set_label_text(label, fontdict=None, **kwargs)`  
 Set the text value of the axis label.  
 ACCEPTS: A string value for the label

**matplotlib.axis.YAxis.set\_major\_formatter**

`YAxis.set_major_formatter(formatter)`  
Set the formatter of the major ticker.

**Parameters**

**formatter** [~matplotlib.ticker.Formatter]

**matplotlib.axis.YAxis.set\_major\_locator**

`YAxis.set_major_locator(locator)`  
Set the locator of the major ticker.

**Parameters**

**locator** [~matplotlib.ticker.Locator]

**matplotlib.axis.YAxis.set\_minor\_formatter**

`YAxis.set_minor_formatter(formatter)`  
Set the formatter of the minor ticker.

**Parameters**

**formatter** [~matplotlib.ticker.Formatter]

**matplotlib.axis.YAxis.set\_minor\_locator**

`YAxis.set_minor_locator(locator)`  
Set the locator of the minor ticker.

**Parameters**

**locator** [~matplotlib.ticker.Locator]

**matplotlib.axis.YAxis.set\_pickradius**

`YAxis.set_pickradius(pickradius)`  
Set the depth of the axis used by the picker.

**Parameters**

**pickradius** [float]

**matplotlib.axis.YAxis.set\_smart\_bounds**

`YAxis.set_smart_bounds(value)`  
set the axis to have smart bounds

**matplotlib.axis.YAxis.set\_tick\_params**

`YAxis.set_tick_params(which='major', reset=False, **kw)`  
 Set appearance parameters for ticks, ticklabels, and gridlines.

For documentation of keyword arguments, see `matplotlib.axes.Axes.tick_params()`.

**matplotlib.axis.YAxis.set\_ticklabels**

`YAxis.set_ticklabels(ticklabels, *args, minor=False, **kwargs)`  
 Set the text values of the tick labels. Return a list of Text instances. Use *kwarg minor=True* to select minor ticks. All other kwargs are used to update the text object properties. As for get ticklabels, label1 (left or bottom) is affected for a given tick only if its label1On attribute is True, and similarly for label2. The list of returned label text objects consists of all such label1 objects followed by all such label2 objects.

The input *ticklabels* is assumed to match the set of tick locations, regardless of the state of label1On and label2On.

ACCEPTS: sequence of strings or Text objects

**matplotlib.axis.YAxis.set\_ticks**

`YAxis.set_ticks(ticks, minor=False)`  
 Set the locations of the tick marks from sequence ticks

ACCEPTS: sequence of floats

**matplotlib.axis.YAxis.set\_units**

`YAxis.set_units(u)`  
 set the units for axis

ACCEPTS: a units tag

**matplotlib.axis.YAxis.set\_view\_interval**

`YAxis.set_view_interval(vmin, vmax, ignore=False)`  
 If *ignore* is *False*, the order of *vmin*, *vmax* does not matter; the original axis orientation will be preserved. In addition, the view limits can be expanded, but will not be reduced. This method is for mpl internal use; for normal use, see `set_ylim()`.

**matplotlib.axis.YAxis.update\_units**

`YAxis.update_units(data)`  
 introspect *data* for units converter and update the axis.converter instance if necessary. Return *True* if *data* is registered for unit conversion.

matplotlib.axis.YAxis.zoom

YAxis.zoom(*direction*)

Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

XAxis

<i>XAxis.OFFSETTEXTPAD</i>	
<i>XAxis.axis_date</i>	Sets up x-axis ticks and labels that treat the x data as dates.
<i>XAxis.cla</i>	clear the current axis
<i>XAxis.convert_units</i>	
<i>XAxis.get_data_interval</i>	return the Interval instance for this axis data limits
<i>XAxis.get_gridlines</i>	Return the grid lines as a list of Line2D instance
<i>XAxis.get_label_position</i>	Return the label position (top or bottom)
<i>XAxis.get_label_text</i>	Get the text of the label
<i>XAxis.get_major_formatter</i>	Get the formatter of the major ticker
<i>XAxis.get_major_locator</i>	Get the locator of the major ticker
<i>XAxis.get_major_ticks</i>	get the tick instances; grow as necessary
<i>XAxis.get_majorticklabels</i>	Return a list of Text instances for the major ticklabels
<i>XAxis.get_majorticklines</i>	Return the major tick lines as a list of Line2D instances
<i>XAxis.get_majorticklocs</i>	Get the major tick locations in data coordinates as a numpy array
<i>XAxis.get_minor_formatter</i>	Get the formatter of the minor ticker
<i>XAxis.get_minor_locator</i>	Get the locator of the minor ticker
<i>XAxis.get_minor_ticks</i>	get the minor tick instances; grow as necessary
<i>XAxis.get_minorticklabels</i>	Return a list of Text instances for the minor ticklabels
<i>XAxis.get_minorticklines</i>	Return the minor tick lines as a list of Line2D instances
<i>XAxis.get_minorticklocs</i>	Get the minor tick locations in data coordinates as a numpy array
<i>XAxis.get_minpos</i>	
<i>XAxis.get_offset_text</i>	Return the axis offsetText as a Text instance
<i>XAxis.get_pickradius</i>	Return the depth of the axis used by the picker
<i>XAxis.get_scale</i>	
<i>XAxis.get_smart_bounds</i>	get whether the axis has smart bounds
<i>XAxis.get_tick_padding</i>	
<i>XAxis.get_tick_space</i>	Return the estimated number of ticks that can fit on the axis.
<i>XAxis.get_ticklabel_extents</i>	Get the extents of the tick labels on either side of the axes.
<i>XAxis.get_ticklabels</i>	Get the tick labels as a list of <i>Text</i> instances.

Continued on next page

Table 130 – continued from previous page

<code>XAxis.get_ticklines</code>	Return the tick lines as a list of Line2D instances
<code>XAxis.get_ticklocs</code>	Get the tick locations in data coordinates as a numpy array
<code>XAxis.get_tightbbox</code>	Return a bounding box that encloses the axis.
<code>XAxis.get_units</code>	return the units for axis
<code>XAxis.get_view_interval</code>	return the Interval instance for this axis view limits
<code>XAxis.grid</code>	Configure the grid lines.
<code>XAxis.iter_ticks</code>	Iterate through all of the major and minor ticks.
<code>XAxis.limit_range_for_scale</code>	
<code>XAxis.pan</code>	Pan <i>numsteps</i> (can be positive or negative)
<code>XAxis.reset_ticks</code>	Re-initialize the major and minor Tick lists.
<code>XAxis.set_data_interval</code>	set the axis data limits
<code>XAxis.set_default_intervals</code>	set the default limits for the axis interval if they are not mutated
<code>XAxis.set_label_coords</code>	Set the coordinates of the label.
<code>XAxis.set_label_position</code>	Set the label position (top or bottom)
<code>XAxis.set_label_text</code>	Set the text value of the axis label.
<code>XAxis.set_major_formatter</code>	Set the formatter of the major ticker.
<code>XAxis.set_major_locator</code>	Set the locator of the major ticker.
<code>XAxis.set_minor_formatter</code>	Set the formatter of the minor ticker.
<code>XAxis.set_minor_locator</code>	Set the locator of the minor ticker.
<code>XAxis.set_pickradius</code>	Set the depth of the axis used by the picker.
<code>XAxis.set_smart_bounds</code>	set the axis to have smart bounds
<code>XAxis.set_tick_params</code>	Set appearance parameters for ticks, ticklabels, and gridlines.
<code>XAxis.set_ticklabels</code>	Set the text values of the tick labels.
<code>XAxis.set_ticks</code>	Set the locations of the tick marks from sequence ticks
<code>XAxis.set_units</code>	set the units for axis
<code>XAxis.set_view_interval</code>	If <i>ignore</i> is <i>False</i> , the order of <i>vmin</i> , <i>vmax</i> does not matter; the original axis orientation will be preserved.
<code>XAxis.update_units</code>	introspect <i>data</i> for units converter and update the <i>axis.converter</i> instance if necessary.
<code>XAxis.zoom</code>	Zoom in/out on axis; if <i>direction</i> is <i>&gt;0</i> zoom in, else zoom out

**matplotlib.axis.XAxis.OFFSETTEXTPAD**

`XAxis.OFFSETTEXTPAD = 3`

**matplotlib.axis.XAxis.axis\_date**

`XAxis.axis_date(tz=None)`

Sets up x-axis ticks and labels that treat the x data as dates. *tz* is a *tzinfo* instance or a

timezone string. This timezone is used to create date labels.

**matplotlib.axis.XAxis.cla**

`XAxis.cla()`  
clear the current axis

**matplotlib.axis.XAxis.convert\_units**

`XAxis.convert_units(x)`

**matplotlib.axis.XAxis.get\_data\_interval**

`XAxis.get_data_interval()`  
return the Interval instance for this axis data limits

**matplotlib.axis.XAxis.get\_gridlines**

`XAxis.get_gridlines()`  
Return the grid lines as a list of Line2D instance

**matplotlib.axis.XAxis.get\_label\_position**

`XAxis.get_label_position()`  
Return the label position (top or bottom)

**matplotlib.axis.XAxis.get\_label\_text**

`XAxis.get_label_text()`  
Get the text of the label

**matplotlib.axis.XAxis.get\_major\_formatter**

`XAxis.get_major_formatter()`  
Get the formatter of the major ticker

**matplotlib.axis.XAxis.get\_major\_locator**

`XAxis.get_major_locator()`  
Get the locator of the major ticker

**matplotlib.axis.XAxis.get\_major\_ticks**

`XAxis.get_major_ticks(numticks=None)`  
get the tick instances; grow as necessary

**matplotlib.axis.XAxis.get\_majorticklabels**

`XAxis.get_majorticklabels()`  
Return a list of Text instances for the major ticklabels

**matplotlib.axis.XAxis.get\_majorticklines**

`XAxis.get_majorticklines()`  
Return the major tick lines as a list of Line2D instances

**matplotlib.axis.XAxis.get\_majorticklocs**

`XAxis.get_majorticklocs()`  
Get the major tick locations in data coordinates as a numpy array

**matplotlib.axis.XAxis.get\_minor\_formatter**

`XAxis.get_minor_formatter()`  
Get the formatter of the minor ticker

**matplotlib.axis.XAxis.get\_minor\_locator**

`XAxis.get_minor_locator()`  
Get the locator of the minor ticker

**matplotlib.axis.XAxis.get\_minor\_ticks**

`XAxis.get_minor_ticks(numticks=None)`  
get the minor tick instances; grow as necessary

**matplotlib.axis.XAxis.get\_minorticklabels**

`XAxis.get_minorticklabels()`  
Return a list of Text instances for the minor ticklabels

**matplotlib.axis.XAxis.get\_minorticklines**

`XAxis.get_minorticklines()`  
Return the minor tick lines as a list of Line2D instances

**matplotlib.axis.XAxis.get\_minorticklocs**

`XAxis.get_minorticklocs()`

Get the minor tick locations in data coordinates as a numpy array

**matplotlib.axis.XAxis.get\_minpos**

`XAxis.get_minpos()`

**matplotlib.axis.XAxis.get\_offset\_text**

`XAxis.get_offset_text()`

Return the axis offsetText as a Text instance

**matplotlib.axis.XAxis.get\_pickradius**

`XAxis.get_pickradius()`

Return the depth of the axis used by the picker

**matplotlib.axis.XAxis.get\_scale**

`XAxis.get_scale()`

**matplotlib.axis.XAxis.get\_smart\_bounds**

`XAxis.get_smart_bounds()`

get whether the axis has smart bounds

**matplotlib.axis.XAxis.get\_tick\_padding**

`XAxis.get_tick_padding()`

**matplotlib.axis.XAxis.get\_tick\_space**

`XAxis.get_tick_space()`

Return the estimated number of ticks that can fit on the axis.

**matplotlib.axis.XAxis.get\_ticklabel\_extents**

`XAxis.get_ticklabel_extents(renderer)`

Get the extents of the tick labels on either side of the axes.

**matplotlib.axis.XAxis.get\_ticklabels**

`XAxis.get_ticklabels(minor=False, which=None)`  
 Get the tick labels as a list of *Text* instances.

**Parameters**

**minor** [bool] If True return the minor ticklabels, else return the major ticklabels

**which** [None, ('minor', 'major', 'both')] Overrides minor.  
 Selects which ticklabels to return

**Returns**

**ret** [list] List of *Text* instances.

**matplotlib.axis.XAxis.get\_ticklines**

`XAxis.get_ticklines(minor=False)`  
 Return the tick lines as a list of *Line2D* instances

**matplotlib.axis.XAxis.get\_ticklocs**

`XAxis.get_ticklocs(minor=False)`  
 Get the tick locations in data coordinates as a numpy array

**matplotlib.axis.XAxis.get\_tightbbox**

`XAxis.get_tightbbox(renderer)`  
 Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

**matplotlib.axis.XAxis.get\_units**

`XAxis.get_units()`  
 return the units for axis

**matplotlib.axis.XAxis.get\_view\_interval**

`XAxis.get_view_interval()`  
 return the Interval instance for this axis view limits

**matplotlib.axis.XAxis.grid**

`XAxis.grid(b=None, which='major', **kwargs)`  
 Configure the grid lines.

**Parameters**

**b** [bool or None] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

**which** [{'major', 'minor', 'both'}] The grid lines to apply the changes on.

**\*\*kwargs** [*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

#### matplotlib.axis.XAxis.iter\_ticks

`XAxis.iter_ticks()`

Iterate through all of the major and minor ticks.

#### matplotlib.axis.XAxis.limit\_range\_for\_scale

`XAxis.limit_range_for_scale(vmin, vmax)`

#### matplotlib.axis.XAxis.pan

`XAxis.pan(numsteps)`

Pan *numsteps* (can be positive or negative)

#### matplotlib.axis.XAxis.reset\_ticks

`XAxis.reset_ticks()`

Re-initialize the major and minor Tick lists.

Each list starts with a single fresh Tick.

#### matplotlib.axis.XAxis.set\_data\_interval

`XAxis.set_data_interval(vmin, vmax, ignore=False)`  
set the axis data limits

#### matplotlib.axis.XAxis.set\_default\_intervals

`XAxis.set_default_intervals()`

set the default limits for the axis interval if they are not mutated

**matplotlib.axis.XAxis.set\_label\_coords**

`XAxis.set_label_coords(x, y, transform=None)`

Set the coordinates of the label. By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coordinate of the x label.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc

**matplotlib.axis.XAxis.set\_label\_position**

`XAxis.set_label_position(position)`

Set the label position (top or bottom)

**Parameters**

**position** [{'top', 'bottom'}]

**matplotlib.axis.XAxis.set\_label\_text**

`XAxis.set_label_text(label, fontdict=None, **kwargs)`

Set the text value of the axis label.

ACCEPTS: A string value for the label

**matplotlib.axis.XAxis.set\_major\_formatter**

`XAxis.set_major_formatter(formatter)`

Set the formatter of the major ticker.

**Parameters**

**formatter** [~matplotlib.ticker.Formatter]

**matplotlib.axis.XAxis.set\_major\_locator**

`XAxis.set_major_locator(locator)`

Set the locator of the major ticker.

**Parameters**

**locator** [~matplotlib.ticker.Locator]

**matplotlib.axis.XAxis.set\_minor\_formatter**

`XAxis.set_minor_formatter(formatter)`

Set the formatter of the minor ticker.

**Parameters**

**formatter** [~matplotlib.ticker.Formatter]

#### matplotlib.axis.XAxis.set\_minor\_locator

`XAxis.set_minor_locator(locator)`  
Set the locator of the minor ticker.

##### Parameters

**locator** [~matplotlib.ticker.Locator]

#### matplotlib.axis.XAxis.set\_pickradius

`XAxis.set_pickradius(pickradius)`  
Set the depth of the axis used by the picker.

##### Parameters

**pickradius** [float]

#### matplotlib.axis.XAxis.set\_smart\_bounds

`XAxis.set_smart_bounds(value)`  
set the axis to have smart bounds

#### matplotlib.axis.XAxis.set\_tick\_params

`XAxis.set_tick_params(which='major', reset=False, **kw)`  
Set appearance parameters for ticks, ticklabels, and gridlines.  
For documentation of keyword arguments, see `matplotlib.axes.Axes.tick_params()`.

#### matplotlib.axis.XAxis.set\_ticklabels

`XAxis.set_ticklabels(ticklabels, *args, minor=False, **kwargs)`  
Set the text values of the tick labels. Return a list of Text instances. Use *kwarg minor=True* to select minor ticks. All other kwargs are used to update the text object properties. As for `get_ticklabels`, *label1* (left or bottom) is affected for a given tick only if its *label1On* attribute is True, and similarly for *label2*. The list of returned label text objects consists of all such *label1* objects followed by all such *label2* objects.

The input *ticklabels* is assumed to match the set of tick locations, regardless of the state of *label1On* and *label2On*.

ACCEPTS: sequence of strings or Text objects

#### matplotlib.axis.XAxis.set\_ticks

`XAxis.set_ticks(ticks, minor=False)`  
Set the locations of the tick marks from sequence ticks

ACCEPTS: sequence of floats

**matplotlib.axis.XAxis.set\_units**

`XAxis.set_units(u)`  
 set the units for axis  
 ACCEPTS: a units tag

**matplotlib.axis.XAxis.set\_view\_interval**

`XAxis.set_view_interval(vmin, vmax, ignore=False)`  
 If *ignore* is *False*, the order of *vmin*, *vmax* does not matter; the original axis orientation will be preserved. In addition, the view limits can be expanded, but will not be reduced. This method is for mpl internal use; for normal use, see `set_xlim()`.

**matplotlib.axis.XAxis.update\_units**

`XAxis.update_units(data)`  
 introspect *data* for units converter and update the axis.converter instance if necessary. Return *True* if *data* is registered for unit conversion.

**matplotlib.axis.XAxis.zoom**

`XAxis.zoom(direction)`  
 Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

**Inherited from artist****Ticks**

<code>Tick.add_callback</code>	Adds a callback function that will be called whenever one of the Artist's properties changes.
<code>Tick.aname</code>	
<code>Tick.axes</code>	The <i>Axes</i> instance the artist resides in, or <i>None</i> .
<code>Tick.contains</code>	Test whether the mouse event occurred in the Tick marks.
<code>Tick.convert_xunits</code>	For artists in an axes, if the xaxis has units support, convert x using xaxis unit type
<code>Tick.convert_yunits</code>	For artists in an axes, if the yaxis has units support, convert y using yaxis unit type
<code>Tick.draw</code>	Derived classes drawing method
<code>Tick.findobj</code>	Find artist objects.
<code>Tick.format_cursor_data</code>	Return <i>cursor data</i> string formatted.
<code>Tick.get_agg_filter</code>	Return filter function to be used for agg filter.

Continued on next page

Table 131 – continued from previous page

<code>Tick.get_alpha</code>	Return the alpha value used for blending - not supported on all backends
<code>Tick.get_animated</code>	Return the artist's animated state
<code>Tick.get_children</code>	Return a list of the child Artist's this :class:`Artist` contains.
<code>Tick.get_clip_box</code>	Return artist clipbox
<code>Tick.get_clip_on</code>	Return whether artist uses clipping
<code>Tick.get_clip_path</code>	Return artist clip path
<code>Tick.get_contains</code>	Return the <code>_contains</code> test used by the artist, or <code>None</code> for default.
<code>Tick.get_cursor_data</code>	Get the cursor data for a given event.
<code>Tick.get_figure</code>	Return the <code>Figure</code> instance the artist belongs to.
<code>Tick.get_gid</code>	Returns the group id.
<code>Tick.get_label</code>	Get the label used for this artist in the legend.
<code>Tick.get_path_effects</code>	
<code>Tick.get_picker</code>	Return the picker object used by this artist.
<code>Tick.get_rasterized</code>	Return whether the artist is to be rasterized.
<code>Tick.get_sketch_params</code>	Returns the sketch parameters for the artist.
<code>Tick.get_snap</code>	Returns the snap setting which may be:
<code>Tick.get_transform</code>	Return the <code>Transform</code> instance used by this artist.
<code>Tick.get_transformed_clip_path_and_affine</code>	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
<code>Tick.get_url</code>	Returns the url.
<code>Tick.get_visible</code>	Return the artist's visibility
<code>Tick.get_window_extent</code>	Get the axes bounding box in display space.
<code>Tick.get_zorder</code>	Return the artist's zorder.
<code>Tick.have_units</code>	Return <code>True</code> if units are set on the x or y axes
<code>Tick.is_transform_set</code>	Returns <code>True</code> if Artist has a transform explicitly set.
<code>Tick.mouseover</code>	
<code>Tick.pchanged</code>	Fire an event when property changed, calling all of the registered callbacks.
<code>Tick.pick</code>	Process pick event
<code>Tick.pickable</code>	Return <code>True</code> if Artist is pickable.
<code>Tick.properties</code>	return a dictionary mapping property name -> value for all Artist props
<code>Tick.remove</code>	Remove the artist from the figure if possible.
<code>Tick.remove_callback</code>	Remove a callback based on its <code>id</code> .
<code>Tick.set</code>	A property batch setter.
<code>Tick.set_agg_filter</code>	Set the agg filter.
<code>Tick.set_alpha</code>	Set the alpha value used for blending - not supported on all backends.
<code>Tick.set_animated</code>	Set the artist's animation state.
<code>Tick.set_clip_box</code>	Set the artist's clip <code>Bbox</code> .
<code>Tick.set_clip_on</code>	Set whether artist uses clipping.
<code>Tick.set_clip_path</code>	Set the artist's clip path, which may be:
<code>Tick.set_contains</code>	Replace the contains test used by this artist.

Continued on next page

Table 131 – continued from previous page

<code>Tick.set_figure</code>	Set the <i>Figure</i> instance the artist belongs to.
<code>Tick.set_gid</code>	Sets the (group) id for the artist.
<code>Tick.set_label</code>	Set the label1 text.
<code>Tick.set_path_effects</code>	Set the path effects.
<code>Tick.set_picker</code>	Set the epsilon for picking used by this artist
<code>Tick.set_rasterized</code>	Force rasterized (bitmap) drawing in vector backend output.
<code>Tick.set_sketch_params</code>	Sets the sketch parameters.
<code>Tick.set_snap</code>	Sets the snap setting which may be:
<code>Tick.set_transform</code>	Set the artist transform.
<code>Tick.set_url</code>	Sets the url for the artist.
<code>Tick.set_visible</code>	Set the artist's visibility.
<code>Tick.set_zorder</code>	Set the zorder for the artist.
<code>Tick.stale</code>	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
<code>Tick.update</code>	Update this artist's properties from the dictionary <i>prop</i> .
<code>Tick.update_from</code>	Copy properties from <i>other</i> to <i>self</i> .
<code>XTick.add_callback</code>	Adds a callback function that will be called whenever one of the Artist's properties changes.
<code>XTick.aname</code>	
<code>XTick.axes</code>	The <i>Axes</i> instance the artist resides in, or <i>None</i> .
<code>XTick.contains</code>	Test whether the mouse event occurred in the Tick marks.
<code>XTick.convert_xunits</code>	For artists in an axes, if the xaxis has units support, convert x using xaxis unit type
<code>XTick.convert_yunits</code>	For artists in an axes, if the yaxis has units support, convert y using yaxis unit type
<code>XTick.draw</code>	Derived classes drawing method
<code>XTick.findobj</code>	Find artist objects.
<code>XTick.format_cursor_data</code>	Return <i>cursor data</i> string formatted.
<code>XTick.get_agg_filter</code>	Return filter function to be used for agg filter.
<code>XTick.get_alpha</code>	Return the alpha value used for blending - not supported on all backends
<code>XTick.get_animated</code>	Return the artist's animated state
<code>XTick.get_children</code>	Return a list of the child Artist's this :class:`Artist` contains.
<code>XTick.get_clip_box</code>	Return artist clipbox
<code>XTick.get_clip_on</code>	Return whether artist uses clipping
<code>XTick.get_clip_path</code>	Return artist clip path
<code>XTick.get_contains</code>	Return the <code>_contains</code> test used by the artist, or <i>None</i> for default.
<code>XTick.get_cursor_data</code>	Get the cursor data for a given event.
<code>XTick.get_figure</code>	Return the <i>Figure</i> instance the artist belongs to.
<code>XTick.get_gid</code>	Returns the group id.

Table 131 – continued from previous page

<code>XTick.get_label</code>	Get the label used for this artist in the legend.
<code>XTick.get_path_effects</code>	
<code>XTick.get_picker</code>	Return the picker object used by this artist.
<code>XTick.get_rasterized</code>	Return whether the artist is to be rasterized.
<code>XTick.get_sketch_params</code>	Returns the sketch parameters for the artist.
<code>XTick.get_snap</code>	Returns the snap setting which may be:
<code>XTick.get_transform</code>	Return the <i>Transform</i> instance used by this artist.
<code>XTick.get_transformed_clip_path_and_affine</code>	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
<code>XTick.get_url</code>	Returns the url.
<code>XTick.get_visible</code>	Return the artist's visibility
<code>XTick.get_window_extent</code>	Get the axes bounding box in display space.
<code>XTick.get_zorder</code>	Return the artist's zorder.
<code>XTick.have_units</code>	Return <i>True</i> if units are set on the x or y axes
<code>XTick.is_transform_set</code>	Returns <i>True</i> if Artist has a transform explicitly set.
<code>XTick.mouseover</code>	
<code>XTick.pchanged</code>	Fire an event when property changed, calling all of the registered callbacks.
<code>XTick.pick</code>	Process pick event
<code>XTick.pickable</code>	Return <i>True</i> if Artist is pickable.
<code>XTick.properties</code>	return a dictionary mapping property name -> value for all Artist props
<code>XTick.remove</code>	Remove the artist from the figure if possible.
<code>XTick.remove_callback</code>	Remove a callback based on its <i>id</i> .
<code>XTick.set</code>	A property batch setter.
<code>XTick.set_agg_filter</code>	Set the agg filter.
<code>XTick.set_alpha</code>	Set the alpha value used for blending - not supported on all backends.
<code>XTick.set_animated</code>	Set the artist's animation state.
<code>XTick.set_clip_box</code>	Set the artist's clip <i>Bbox</i> .
<code>XTick.set_clip_on</code>	Set whether artist uses clipping.
<code>XTick.set_clip_path</code>	Set the artist's clip path, which may be:
<code>XTick.set_contains</code>	Replace the contains test used by this artist.
<code>XTick.set_figure</code>	Set the <i>Figure</i> instance the artist belongs to.
<code>XTick.set_gid</code>	Sets the (group) id for the artist.
<code>XTick.set_label</code>	Set the label1 text.
<code>XTick.set_path_effects</code>	Set the path effects.
<code>XTick.set_picker</code>	Set the epsilon for picking used by this artist
<code>XTick.set_rasterized</code>	Force rasterized (bitmap) drawing in vector backend output.
<code>XTick.set_sketch_params</code>	Sets the sketch parameters.
<code>XTick.set_snap</code>	Sets the snap setting which may be:
<code>XTick.set_transform</code>	Set the artist transform.
<code>XTick.set_url</code>	Sets the url for the artist.
<code>XTick.set_visible</code>	Set the artist's visibility.
<code>XTick.set_zorder</code>	Set the zorder for the artist.

Continued on next page

Table 131 – continued from previous page

<code>XTick.stale</code>	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
<code>XTick.update</code>	Update this artist's properties from the dictionary <i>prop</i> .
<code>XTick.update_from</code>	Copy properties from <i>other</i> to <i>self</i> .
<code>XTick.zorder</code>	
<code>YTick.add_callback</code>	Adds a callback function that will be called whenever one of the Artist's properties changes.
<code>YTick.aname</code>	
<code>YTick.axes</code>	The <i>Axes</i> instance the artist resides in, or <i>None</i> .
<code>YTick.contains</code>	Test whether the mouse event occurred in the Tick marks.
<code>YTick.convert_xunits</code>	For artists in an axes, if the xaxis has units support, convert x using xaxis unit type
<code>YTick.convert_yunits</code>	For artists in an axes, if the yaxis has units support, convert y using yaxis unit type
<code>YTick.draw</code>	Derived classes drawing method
<code>YTick.findobj</code>	Find artist objects.
<code>YTick.format_cursor_data</code>	Return <i>cursor data</i> string formatted.
<code>YTick.get_agg_filter</code>	Return filter function to be used for agg filter.
<code>YTick.get_alpha</code>	Return the alpha value used for blending - not supported on all backends
<code>YTick.get_animated</code>	Return the artist's animated state
<code>YTick.get_children</code>	Return a list of the child Artist's this <code>:class:`Artist</code> contains.
<code>YTick.get_clip_box</code>	Return artist clipbox
<code>YTick.get_clip_on</code>	Return whether artist uses clipping
<code>YTick.get_clip_path</code>	Return artist clip path
<code>YTick.get_contains</code>	Return the <code>_contains</code> test used by the artist, or <i>None</i> for default.
<code>YTick.get_cursor_data</code>	Get the cursor data for a given event.
<code>YTick.get_figure</code>	Return the <i>Figure</i> instance the artist belongs to.
<code>YTick.get_gid</code>	Returns the group id.
<code>YTick.get_label</code>	Get the label used for this artist in the legend.
<code>YTick.get_path_effects</code>	
<code>YTick.get_picker</code>	Return the picker object used by this artist.
<code>YTick.get_rasterized</code>	Return whether the artist is to be rasterized.
<code>YTick.get_sketch_params</code>	Returns the sketch parameters for the artist.
<code>YTick.get_snap</code>	Returns the snap setting which may be:
<code>YTick.get_transform</code>	Return the <i>Transform</i> instance used by this artist.
<code>YTick.get_transformed_clip_path_and_affine</code>	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
<code>YTick.get_url</code>	Returns the url.

Continued on next page

Table 131 – continued from previous page

<code>YTick.get_visible</code>	Return the artist's visibility
<code>YTick.get_window_extent</code>	Get the axes bounding box in display space.
<code>YTick.get_zorder</code>	Return the artist's zorder.
<code>YTick.have_units</code>	Return <i>True</i> if units are set on the x or y axes
<code>YTick.is_transform_set</code>	Returns <i>True</i> if Artist has a transform explicitly set.
<code>YTick.mouseover</code>	
<code>YTick.pchanged</code>	Fire an event when property changed, calling all of the registered callbacks.
<code>YTick.pick</code>	Process pick event
<code>YTick.pickable</code>	Return <i>True</i> if Artist is pickable.
<code>YTick.properties</code>	return a dictionary mapping property name -> value for all Artist props
<code>YTick.remove</code>	Remove the artist from the figure if possible.
<code>YTick.remove_callback</code>	Remove a callback based on its <i>id</i> .
<code>YTick.set</code>	A property batch setter.
<code>YTick.set_agg_filter</code>	Set the agg filter.
<code>YTick.set_alpha</code>	Set the alpha value used for blending - not supported on all backends.
<code>YTick.set_animated</code>	Set the artist's animation state.
<code>YTick.set_clip_box</code>	Set the artist's clip <i>Bbox</i> .
<code>YTick.set_clip_on</code>	Set whether artist uses clipping.
<code>YTick.set_clip_path</code>	Set the artist's clip path, which may be:
<code>YTick.set_contains</code>	Replace the contains test used by this artist.
<code>YTick.set_figure</code>	Set the <i>Figure</i> instance the artist belongs to.
<code>YTick.set_gid</code>	Sets the (group) id for the artist.
<code>YTick.set_label</code>	Set the label1 text.
<code>YTick.set_path_effects</code>	Set the path effects.
<code>YTick.set_picker</code>	Set the epsilon for picking used by this artist
<code>YTick.set_rasterized</code>	Force rasterized (bitmap) drawing in vector backend output.
<code>YTick.set_sketch_params</code>	Sets the sketch parameters.
<code>YTick.set_snap</code>	Sets the snap setting which may be:
<code>YTick.set_transform</code>	Set the artist transform.
<code>YTick.set_url</code>	Sets the url for the artist.
<code>YTick.set_visible</code>	Set the artist's visibility.
<code>YTick.set_zorder</code>	Set the zorder for the artist.
<code>YTick.stale</code>	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
<code>YTick.update</code>	Update this artist's properties from the dictionary <i>prop</i> .
<code>YTick.update_from</code>	Copy properties from <i>other</i> to <i>self</i> .
<code>YTick.zorder</code>	

**matplotlib.axis.Tick.add\_callback****Tick.add\_callback(*func*)**

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

**matplotlib.axis.Tick.aname**

`Tick.aname = 'Artist'`

**matplotlib.axis.Tick.axes**

`Tick.axes`

The *Axes* instance the artist resides in, or *None*.

**matplotlib.axis.Tick.contains**

`Tick.contains(mouseevent)`

Test whether the mouse event occurred in the Tick marks.

This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

**matplotlib.axis.Tick.convert\_xunits**

`Tick.convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

**matplotlib.axis.Tick.convert\_yunits**

`Tick.convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

**matplotlib.axis.Tick.draw**

`Tick.draw(renderer)`

Derived classes drawing method

**matplotlib.axis.Tick.findobj**

`Tick.findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

**matplotlib.axis.Tick.format\_cursor\_data**

`Tick.format_cursor_data(data)`  
Return *cursor data* string formatted.

**matplotlib.axis.Tick.get\_agg\_filter**

`Tick.get_agg_filter()`  
Return filter function to be used for agg filter.

**matplotlib.axis.Tick.get\_alpha**

`Tick.get_alpha()`  
Return the alpha value used for blending - not supported on all backends

**matplotlib.axis.Tick.get\_animated**

`Tick.get_animated()`  
Return the artist's animated state

**matplotlib.axis.Tick.get\_children**

`Tick.get_children()`  
Return a list of the child Artist's this :class:`Artist` contains.

**matplotlib.axis.Tick.get\_clip\_box**

`Tick.get_clip_box()`  
Return artist clipbox

**matplotlib.axis.Tick.get\_clip\_on**

`Tick.get_clip_on()`  
Return whether artist uses clipping

**matplotlib.axis.Tick.get\_clip\_path**

`Tick.get_clip_path()`  
Return artist clip path

**matplotlib.axis.Tick.get\_contains**

`Tick.get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

**matplotlib.axis.Tick.get\_cursor\_data**

`Tick.get_cursor_data(event)`  
Get the cursor data for a given event.

**matplotlib.axis.Tick.get\_figure**

`Tick.get_figure()`  
Return the *Figure* instance the artist belongs to.

**matplotlib.axis.Tick.get\_gid**

`Tick.get_gid()`  
Returns the group id.

**matplotlib.axis.Tick.get\_label**

`Tick.get_label()`  
Get the label used for this artist in the legend.

**matplotlib.axis.Tick.get\_path\_effects**

`Tick.get_path_effects()`

**matplotlib.axis.Tick.get\_picker**

`Tick.get_picker()`  
Return the picker object used by this artist.

**matplotlib.axis.Tick.get\_rasterized**

`Tick.get_rasterized()`  
Return whether the artist is to be rasterized.

**matplotlib.axis.Tick.get\_sketch\_params**

`Tick.get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or *None*] A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.

- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

#### `matplotlib.axis.Tick.get_snap`

`Tick.get_snap()`

Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

#### `matplotlib.axis.Tick.get_transform`

`Tick.get_transform()`

Return the *Transform* instance used by this artist.

#### `matplotlib.axis.Tick.get_transformed_clip_path_and_affine`

`Tick.get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

#### `matplotlib.axis.Tick.get_url`

`Tick.get_url()`

Returns the url.

#### `matplotlib.axis.Tick.get_visible`

`Tick.get_visible()`

Return the artist's visibility

#### `matplotlib.axis.Tick.get_window_extent`

`Tick.get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when

saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

#### **matplotlib.axis.Tick.get\_zorder**

`Tick.get_zorder()`  
Return the artist's zorder.

#### **matplotlib.axis.Tick.have\_units**

`Tick.have_units()`  
Return *True* if units are set on the x or y axes

#### **matplotlib.axis.Tick.is\_transform\_set**

`Tick.is_transform_set()`  
Returns *True* if Artist has a transform explicitly set.

#### **matplotlib.axis.Tick.mouseover**

`Tick.mouseover`

#### **matplotlib.axis.Tick.pchanged**

`Tick.pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

#### **matplotlib.axis.Tick.pick**

`Tick.pick(mouseevent)`  
Process pick event  
each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

#### **matplotlib.axis.Tick.pickable**

`Tick.pickable()`  
Return *True* if Artist is pickable.

#### **matplotlib.axis.Tick.properties**

`Tick.properties()`  
return a dictionary mapping property name -> value for all Artist props

### matplotlib.axis.Tick.remove

`Tick.remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

### matplotlib.axis.Tick.remove\_callback

`Tick.remove_callback(oid)`

Remove a callback based on its *id*.

#### See also:

`add_callback()` For adding callbacks

### matplotlib.axis.Tick.set

`Tick.set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

### matplotlib.axis.Tick.set\_agg\_filter

`Tick.set_agg_filter(filter_func)`

Set the agg filter.

#### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

### matplotlib.axis.Tick.set\_alpha

`Tick.set_alpha(alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha** [float]

### matplotlib.axis.Tick.set\_animated

`Tick.set_animated(b)`

Set the artist's animation state.

#### Parameters

**b** [bool]

#### matplotlib.axis.Tick.set\_clip\_box

Tick.set\_clip\_box(*clipbox*)  
Set the artist's clip *Bbox*.

##### Parameters

**clipbox** [*Bbox*]

#### matplotlib.axis.Tick.set\_clip\_on

Tick.set\_clip\_on(*b*)  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

##### Parameters

**b** [bool]

#### matplotlib.axis.Tick.set\_clip\_path

Tick.set\_clip\_path(*clippath*, *transform=None*)  
Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

#### matplotlib.axis.Tick.set\_contains

Tick.set\_contains(*picker*)  
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

##### Parameters

**picker** [callable]

### matplotlib.axis.Tick.set\_figure

Tick.set\_figure(*fig*)  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

### matplotlib.axis.Tick.set\_gid

Tick.set\_gid(*gid*)  
Sets the (group) id for the artist.

#### Parameters

**gid** [str]

### matplotlib.axis.Tick.set\_label

Tick.set\_label(*s*)  
Set the label1 text.

#### Parameters

**s** [str]

### matplotlib.axis.Tick.set\_path\_effects

Tick.set\_path\_effects(*path\_effects*)  
Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

### matplotlib.axis.Tick.set\_picker

Tick.set\_picker(*picker*)  
Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

### Parameters

**picker** [None or bool or float or callable]

### matplotlib.axis.Tick.set\_rasterized

Tick.set\_rasterized(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

### matplotlib.axis.Tick.set\_sketch\_params

Tick.set\_sketch\_params(*scale=None, length=None, randomness=None*)

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

### matplotlib.axis.Tick.set\_snap

Tick.set\_snap(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

### Parameters

**snap** [bool or None]

### matplotlib.axis.Tick.set\_transform

Tick.set\_transform(*t*)  
Set the artist transform.

#### Parameters

**t** [*Transform*]

### matplotlib.axis.Tick.set\_url

Tick.set\_url(*url*)  
Sets the url for the artist.

#### Parameters

**url** [str]

### matplotlib.axis.Tick.set\_visible

Tick.set\_visible(*b*)  
Set the artist's visibility.

#### Parameters

**b** [bool]

### matplotlib.axis.Tick.set\_zorder

Tick.set\_zorder(*level*)  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

### matplotlib.axis.Tick.stale

Tick.stale  
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

### matplotlib.axis.Tick.update

Tick.update(*props*)  
Update this artist's properties from the dictionary *prop*.

**matplotlib.axis.Tick.update\_from**

`Tick.update_from(other)`  
Copy properties from *other* to *self*.

**matplotlib.axis.Tick.zorder**

`Tick.zorder = 0`

**matplotlib.axis.XTick.add\_callback**

`XTick.add_callback(func)`  
Adds a callback function that will be called whenever one of the Artist's properties changes.  
Returns an *id* that is useful for removing the callback with `remove_callback()` later.

**matplotlib.axis.XTick.aname**

`XTick.aname = 'Artist'`

**matplotlib.axis.XTick.axes**

`XTick.axes`  
The *Axes* instance the artist resides in, or *None*.

**matplotlib.axis.XTick.contains**

`XTick.contains(mouseevent)`  
Test whether the mouse event occurred in the Tick marks.  
This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

**matplotlib.axis.XTick.convert\_xunits**

`XTick.convert_xunits(x)`  
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

**matplotlib.axis.XTick.convert\_yunits**

`XTick.convert_yunits(y)`  
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

**matplotlib.axis.XTick.draw**

`XTick.draw(renderer)`  
Derived classes drawing method

**matplotlib.axis.XTick.findobj**

`XTick.findobj(match=None, include_self=True)`  
Find artist objects.  
Recursively find all *Artist* instances contained in self.  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

**matplotlib.axis.XTick.format\_cursor\_data**

`XTick.format_cursor_data(data)`  
Return *cursor data* string formatted.

**matplotlib.axis.XTick.get\_agg\_filter**

`XTick.get_agg_filter()`  
Return filter function to be used for agg filter.

**matplotlib.axis.XTick.get\_alpha**

`XTick.get_alpha()`  
Return the alpha value used for blending - not supported on all backends

**matplotlib.axis.XTick.get\_animated**

`XTick.get_animated()`  
Return the artist's animated state

**matplotlib.axis.XTick.get\_children**

`XTick.get_children()`  
Return a list of the child `Artist`s` this `:class:`Artist` contains.

**matplotlib.axis.XTick.get\_clip\_box**

`XTick.get_clip_box()`  
Return artist clipbox

**matplotlib.axis.XTick.get\_clip\_on**

`XTick.get_clip_on()`  
Return whether artist uses clipping

**matplotlib.axis.XTick.get\_clip\_path**

`XTick.get_clip_path()`  
Return artist clip path

**matplotlib.axis.XTick.get\_contains**

`XTick.get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

**matplotlib.axis.XTick.get\_cursor\_data**

`XTick.get_cursor_data(event)`  
Get the cursor data for a given event.

**matplotlib.axis.XTick.get\_figure**

`XTick.get_figure()`  
Return the *Figure* instance the artist belongs to.

**matplotlib.axis.XTick.get\_gid**

`XTick.get_gid()`  
Returns the group id.

**matplotlib.axis.XTick.get\_label**

`XTick.get_label()`  
Get the label used for this artist in the legend.

**matplotlib.axis.XTick.get\_path\_effects**

`XTick.get_path_effects()`

### matplotlib.axis.XTick.get\_picker

`XTick.get_picker()`  
Return the picker object used by this artist.

### matplotlib.axis.XTick.get\_rasterized

`XTick.get_rasterized()`  
Return whether the artist is to be rasterized.

### matplotlib.axis.XTick.get\_sketch\_params

`XTick.get_sketch_params()`  
Returns the sketch parameters for the artist.

#### Returns

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

### matplotlib.axis.XTick.get\_snap

`XTick.get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

### matplotlib.axis.XTick.get\_transform

`XTick.get_transform()`  
Return the *Transform* instance used by this artist.

### matplotlib.axis.XTick.get\_transformed\_clip\_path\_and\_affine

`XTick.get_transformed_clip_path_and_affine()`  
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**matplotlib.axis.XTick.get\_url**

`XTick.get_url()`  
Returns the url.

**matplotlib.axis.XTick.get\_visible**

`XTick.get_visible()`  
Return the artist's visibility

**matplotlib.axis.XTick.get\_window\_extent**

`XTick.get_window_extent(renderer)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**matplotlib.axis.XTick.get\_zorder**

`XTick.get_zorder()`  
Return the artist's zorder.

**matplotlib.axis.XTick.have\_units**

`XTick.have_units()`  
Return *True* if units are set on the x or y axes

**matplotlib.axis.XTick.is\_transform\_set**

`XTick.is_transform_set()`  
Returns *True* if Artist has a transform explicitly set.

**matplotlib.axis.XTick.mouseover**

`XTick.mouseover`

**matplotlib.axis.XTick.pchanged**

`XTick.pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

### matplotlib.axis.XTick.pick

`XTick.pick(mouseevent)`  
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

### matplotlib.axis.XTick.pickable

`XTick.pickable()`  
Return *True* if Artist is pickable.

### matplotlib.axis.XTick.properties

`XTick.properties()`  
return a dictionary mapping property name -> value for all Artist props

### matplotlib.axis.XTick.remove

`XTick.remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

### matplotlib.axis.XTick.remove\_callback

`XTick.remove_callback(oid)`  
Remove a callback based on its *id*.

#### See also:

`add_callback()` For adding callbacks

### matplotlib.axis.XTick.set

`XTick.set(**kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

---

**matplotlib.axis.XTick.set\_agg\_filter**

`XTick.set_agg_filter(filter_func)`  
Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**matplotlib.axis.XTick.set\_alpha**

`XTick.set_alpha(alpha)`  
Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float]

**matplotlib.axis.XTick.set\_animated**

`XTick.set_animated(b)`  
Set the artist's animation state.

**Parameters**

**b** [bool]

**matplotlib.axis.XTick.set\_clip\_box**

`XTick.set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

**matplotlib.axis.XTick.set\_clip\_on**

`XTick.set_clip_on(b)`  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

**matplotlib.axis.XTick.set\_clip\_path**`XTick.set_clip_path(clippath, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- *None*, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | *None*]**matplotlib.axis.XTick.set\_contains**`XTick.set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

**Parameters****picker** [callable]**matplotlib.axis.XTick.set\_figure**`XTick.set_figure(fig)`Set the *Figure* instance the artist belongs to.**Parameters****fig** [*Figure*]**matplotlib.axis.XTick.set\_gid**`XTick.set_gid(gid)`

Sets the (group) id for the artist.

**Parameters****gid** [str]**matplotlib.axis.XTick.set\_label**`XTick.set_label(s)`

Set the label1 text.

**Parameters****s** [str]**matplotlib.axis.XTick.set\_path\_effects**

`XTick.set_path_effects(path_effects)`  
 Set the path effects.

**Parameters****path\_effects** [*AbstractPathEffect*]**matplotlib.axis.XTick.set\_picker**

`XTick.set_picker(picker)`  
 Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the `PickEvent` attributes.

**Parameters****picker** [None or bool or float or callable]**matplotlib.axis.XTick.set\_rasterized**

`XTick.set_rasterized(rasterized)`  
 Force rasterized (bitmap) drawing in vector backend output.  
 Defaults to *None*, which implies the backend's default behavior.

**Parameters****rasterized** [bool or None]

### matplotlib.axis.XTick.set\_sketch\_params

`XTick.set_sketch_params(scale=None, length=None, randomness=None)`  
Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

### matplotlib.axis.XTick.set\_snap

`XTick.set_snap(snap)`  
Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None]

### matplotlib.axis.XTick.set\_transform

`XTick.set_transform(t)`  
Set the artist transform.

#### Parameters

**t** [*Transform*]

### matplotlib.axis.XTick.set\_url

`XTick.set_url(url)`  
Sets the url for the artist.

#### Parameters

**url** [str]

**matplotlib.axis.XTick.set\_visible**

`XTick.set_visible(b)`  
Set the artist's visibility.

**Parameters**

**b** [bool]

**matplotlib.axis.XTick.set\_zorder**

`XTick.set_zorder(level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

**matplotlib.axis.XTick.stale**

`XTick.stale`  
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**matplotlib.axis.XTick.update**

`XTick.update(props)`  
Update this artist's properties from the dictionary *prop*.

**matplotlib.axis.XTick.update\_from**

`XTick.update_from(other)`  
Copy properties from *other* to *self*.

**matplotlib.axis.XTick.zorder**

`XTick.zorder = 0`

**matplotlib.axis.YTick.add\_callback**

`YTick.add_callback(func)`  
Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

### matplotlib.axis.YTick.aname

`YTick.aname = 'Artist'`

### matplotlib.axis.YTick.axes

`YTick.axes`

The *Axes* instance the artist resides in, or *None*.

### matplotlib.axis.YTick.contains

`YTick.contains(mouseevent)`

Test whether the mouse event occurred in the Tick marks.

This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

### matplotlib.axis.YTick.convert\_xunits

`YTick.convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

### matplotlib.axis.YTick.convert\_yunits

`YTick.convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

### matplotlib.axis.YTick.draw

`YTick.draw(renderer)`

Derived classes drawing method

### matplotlib.axis.YTick.findobj

`YTick.findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

**matplotlib.axis.YTick.format\_cursor\_data**

`YTick.format_cursor_data(data)`  
Return *cursor data* string formatted.

**matplotlib.axis.YTick.get\_agg\_filter**

`YTick.get_agg_filter()`  
Return filter function to be used for agg filter.

**matplotlib.axis.YTick.get\_alpha**

`YTick.get_alpha()`  
Return the alpha value used for blending - not supported on all backends

**matplotlib.axis.YTick.get\_animated**

`YTick.get_animated()`  
Return the artist's animated state

**matplotlib.axis.YTick.get\_children**

`YTick.get_children()`  
Return a list of the child Artist's this :class:`Artist` contains.

**matplotlib.axis.YTick.get\_clip\_box**

`YTick.get_clip_box()`  
Return artist clipbox

**matplotlib.axis.YTick.get\_clip\_on**

`YTick.get_clip_on()`  
Return whether artist uses clipping

**matplotlib.axis.YTick.get\_clip\_path**

`YTick.get_clip_path()`  
Return artist clip path

**matplotlib.axis.YTick.get\_contains**

`YTick.get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

**matplotlib.axis.YTick.get\_cursor\_data**

`YTick.get_cursor_data(event)`  
Get the cursor data for a given event.

**matplotlib.axis.YTick.get\_figure**

`YTick.get_figure()`  
Return the *Figure* instance the artist belongs to.

**matplotlib.axis.YTick.get\_gid**

`YTick.get_gid()`  
Returns the group id.

**matplotlib.axis.YTick.get\_label**

`YTick.get_label()`  
Get the label used for this artist in the legend.

**matplotlib.axis.YTick.get\_path\_effects**

`YTick.get_path_effects()`

**matplotlib.axis.YTick.get\_picker**

`YTick.get_picker()`  
Return the picker object used by this artist.

**matplotlib.axis.YTick.get\_rasterized**

`YTick.get_rasterized()`  
Return whether the artist is to be rasterized.

**matplotlib.axis.YTick.get\_sketch\_params**

`YTick.get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or *None*] A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.

- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

### `matplotlib.axis.YTick.get_snap`

`YTick.get_snap()`

Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

### `matplotlib.axis.YTick.get_transform`

`YTick.get_transform()`

Return the *Transform* instance used by this artist.

### `matplotlib.axis.YTick.get_transformed_clip_path_and_affine`

`YTick.get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

### `matplotlib.axis.YTick.get_url`

`YTick.get_url()`

Returns the url.

### `matplotlib.axis.YTick.get_visible`

`YTick.get_visible()`

Return the artist's visibility

### `matplotlib.axis.YTick.get_window_extent`

`YTick.get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when

saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**matplotlib.axis.YTick.get\_zorder**

`YTick.get_zorder()`  
Return the artist's zorder.

**matplotlib.axis.YTick.have\_units**

`YTick.have_units()`  
Return *True* if units are set on the x or y axes

**matplotlib.axis.YTick.is\_transform\_set**

`YTick.is_transform_set()`  
Returns *True* if Artist has a transform explicitly set.

**matplotlib.axis.YTick.mouseover**

`YTick.mouseover`

**matplotlib.axis.YTick.pchanged**

`YTick.pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

**matplotlib.axis.YTick.pick**

`YTick.pick(mouseevent)`  
Process pick event  
each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

**matplotlib.axis.YTick.pickable**

`YTick.pickable()`  
Return *True* if Artist is pickable.

**matplotlib.axis.YTick.properties**

`YTick.properties()`  
return a dictionary mapping property name -> value for all Artist props

**matplotlib.axis.YTick.remove**`YTick.remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**matplotlib.axis.YTick.remove\_callback**`YTick.remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

**matplotlib.axis.YTick.set**`YTick.set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

**matplotlib.axis.YTick.set\_agg\_filter**`YTick.set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**matplotlib.axis.YTick.set\_alpha**`YTick.set_alpha(alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float]

**matplotlib.axis.YTick.set\_animated**`YTick.set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

#### matplotlib.axis.YTick.set\_clip\_box

`YTick.set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

##### Parameters

**clipbox** [*Bbox*]

#### matplotlib.axis.YTick.set\_clip\_on

`YTick.set_clip_on(b)`  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

##### Parameters

**b** [bool]

#### matplotlib.axis.YTick.set\_clip\_path

`YTick.set_clip_path(clippath, transform=None)`  
Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [*(Path, Transform) | Patch | None*]

#### matplotlib.axis.YTick.set\_contains

`YTick.set_contains(picker)`  
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

##### Parameters

**picker** [callable]

**matplotlib.axis.YTick.set\_figure**

`YTick.set_figure(fig)`  
Set the *Figure* instance the artist belongs to.

**Parameters**

**fig** [*Figure*]

**matplotlib.axis.YTick.set\_gid**

`YTick.set_gid(gid)`  
Sets the (group) id for the artist.

**Parameters**

**gid** [str]

**matplotlib.axis.YTick.set\_label**

`YTick.set_label(s)`  
Set the label1 text.

**Parameters**

**s** [str]

**matplotlib.axis.YTick.set\_path\_effects**

`YTick.set_path_effects(path_effects)`  
Set the path effects.

**Parameters**

**path\_effects** [*AbstractPathEffect*]

**matplotlib.axis.YTick.set\_picker**

`YTick.set_picker(picker)`  
Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

### Parameters

**picker** [None or bool or float or callable]

### matplotlib.axis.YTick.set\_rasterized

`YTick.set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

### matplotlib.axis.YTick.set\_sketch\_params

`YTick.set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

### matplotlib.axis.YTick.set\_snap

`YTick.set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

### Parameters

**snap** [bool or None]

---

**matplotlib.axis.YTick.set\_transform**

`YTick.set_transform(t)`  
Set the artist transform.

**Parameters**

**t** [*Transform*]

**matplotlib.axis.YTick.set\_url**

`YTick.set_url(url)`  
Sets the url for the artist.

**Parameters**

**url** [str]

**matplotlib.axis.YTick.set\_visible**

`YTick.set_visible(b)`  
Set the artist's visibility.

**Parameters**

**b** [bool]

**matplotlib.axis.YTick.set\_zorder**

`YTick.set_zorder(level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

**matplotlib.axis.YTick.stale**

`YTick.stale`  
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**matplotlib.axis.YTick.update**

`YTick.update(props)`  
Update this artist's properties from the dictionary *prop*.

**matplotlib.axis.YTick.update\_from**

`YTick.update_from(other)`  
 Copy properties from *other* to *self*.

**matplotlib.axis.YTick.zorder**

`YTick.zorder = 0`

**Axis**

<code>Axis.add_callback</code>	Adds a callback function that will be called whenever one of the Artist's properties changes.
<code>Axis.aname</code>	
<code>Axis.axes</code>	The <i>Axes</i> instance the artist resides in, or <i>None</i> .
<code>Axis.contains</code>	Test whether the artist contains the mouse event.
<code>Axis.convert_xunits</code>	For artists in an axes, if the xaxis has units support, convert x using xaxis unit type
<code>Axis.convert_yunits</code>	For artists in an axes, if the yaxis has units support, convert y using yaxis unit type
<code>Axis.draw</code>	Draw the axis lines, grid lines, tick lines and labels
<code>Axis.findobj</code>	Find artist objects.
<code>Axis.format_cursor_data</code>	Return <i>cursor data</i> string formatted.
<code>Axis.get_agg_filter</code>	Return filter function to be used for agg filter.
<code>Axis.get_alpha</code>	Return the alpha value used for blending - not supported on all backends
<code>Axis.get_animated</code>	Return the artist's animated state
<code>Axis.get_children</code>	Return a list of the child Artist's this :class:`Artist` contains.
<code>Axis.get_clip_box</code>	Return artist clipbox
<code>Axis.get_clip_on</code>	Return whether artist uses clipping
<code>Axis.get_clip_path</code>	Return artist clip path
<code>Axis.get_contains</code>	Return the <code>_contains</code> test used by the artist, or <i>None</i> for default.
<code>Axis.get_cursor_data</code>	Get the cursor data for a given event.
<code>Axis.get_figure</code>	Return the <i>Figure</i> instance the artist belongs to.
<code>Axis.get_gid</code>	Returns the group id.
<code>Axis.get_label</code>	Return the axis label as a Text instance
<code>Axis.get_path_effects</code>	
<code>Axis.get_picker</code>	Return the picker object used by this artist.
<code>Axis.get_rasterized</code>	Return whether the artist is to be rasterized.
<code>Axis.get_sketch_params</code>	Returns the sketch parameters for the artist.
<code>Axis.get_snap</code>	Returns the snap setting which may be:

Continued on next page

Table 132 – continued from previous page

<code>Axis.get_transform</code>	Return the <i>Transform</i> instance used by this artist.
<code>Axis.get_transformed_clip_path_and_affine</code>	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
<code>Axis.get_url</code>	Returns the url.
<code>Axis.get_visible</code>	Return the artist's visibility
<code>Axis.get_window_extent</code>	Get the axes bounding box in display space.
<code>Axis.get_zorder</code>	Return the artist's zorder.
<code>Axis.have_units</code>	Return <i>True</i> if units are set on the x or y axes
<code>Axis.is_transform_set</code>	Returns <i>True</i> if Artist has a transform explicitly set.
<code>Axis.mouseover</code>	
<code>Axis.pchanged</code>	Fire an event when property changed, calling all of the registered callbacks.
<code>Axis.pick</code>	Process pick event
<code>Axis.pickable</code>	Return <i>True</i> if Artist is pickable.
<code>Axis.properties</code>	return a dictionary mapping property name -> value for all Artist props
<code>Axis.remove</code>	Remove the artist from the figure if possible.
<code>Axis.remove_callback</code>	Remove a callback based on its <i>id</i> .
<code>Axis.set</code>	A property batch setter.
<code>Axis.set_agg_filter</code>	Set the agg filter.
<code>Axis.set_alpha</code>	Set the alpha value used for blending - not supported on all backends.
<code>Axis.set_animated</code>	Set the artist's animation state.
<code>Axis.set_clip_box</code>	Set the artist's clip <i>Bbox</i> .
<code>Axis.set_clip_on</code>	Set whether artist uses clipping.
<code>Axis.set_clip_path</code>	Set the artist's clip path, which may be:
<code>Axis.set_contains</code>	Replace the contains test used by this artist.
<code>Axis.set_figure</code>	Set the <i>Figure</i> instance the artist belongs to.
<code>Axis.set_gid</code>	Sets the (group) id for the artist.
<code>Axis.set_label</code>	Set the label to <i>s</i> for auto legend.
<code>Axis.set_path_effects</code>	Set the path effects.
<code>Axis.set_picker</code>	Set the epsilon for picking used by this artist
<code>Axis.set_rasterized</code>	Force rasterized (bitmap) drawing in vector backend output.
<code>Axis.set_sketch_params</code>	Sets the sketch parameters.
<code>Axis.set_snap</code>	Sets the snap setting which may be:
<code>Axis.set_transform</code>	Set the artist transform.
<code>Axis.set_url</code>	Sets the url for the artist.
<code>Axis.set_visible</code>	Set the artist's visibility.
<code>Axis.set_zorder</code>	Set the zorder for the artist.
<code>Axis.stale</code>	If the artist is 'stale' and needs to be redrawn for the output to match the internal state of the artist.
<code>Axis.update</code>	Update this artist's properties from the dictionary <i>prop</i> .
<code>Axis.update_from</code>	Copy properties from <i>other</i> to <i>self</i> .
<code>Axis.zorder</code>	

Continued on next page

Table 132 – continued from previous page

<code>XAxis.add_callback</code>	Adds a callback function that will be called whenever one of the Artist's properties changes.
<code>XAxis.aname</code>	
<code>XAxis.axes</code>	The <i>Axes</i> instance the artist resides in, or <i>None</i> .
<code>XAxis.contains</code>	Test whether the mouse event occurred in the x axis.
<code>XAxis.convert_xunits</code>	For artists in an axes, if the xaxis has units support, convert x using xaxis unit type
<code>XAxis.convert_yunits</code>	For artists in an axes, if the yaxis has units support, convert y using yaxis unit type
<code>XAxis.draw</code>	Draw the axis lines, grid lines, tick lines and labels
<code>XAxis.findobj</code>	Find artist objects.
<code>XAxis.format_cursor_data</code>	Return <i>cursor data</i> string formatted.
<code>XAxis.get_agg_filter</code>	Return filter function to be used for agg filter.
<code>XAxis.get_alpha</code>	Return the alpha value used for blending - not supported on all backends
<code>XAxis.get_animated</code>	Return the artist's animated state
<code>XAxis.get_children</code>	Return a list of the child Artist's this :class:`Artist` contains.
<code>XAxis.get_clip_box</code>	Return artist clipbox
<code>XAxis.get_clip_on</code>	Return whether artist uses clipping
<code>XAxis.get_clip_path</code>	Return artist clip path
<code>XAxis.get_contains</code>	Return the <code>_contains</code> test used by the artist, or <i>None</i> for default.
<code>XAxis.get_cursor_data</code>	Get the cursor data for a given event.
<code>XAxis.get_figure</code>	Return the <i>Figure</i> instance the artist belongs to.
<code>XAxis.get_gid</code>	Returns the group id.
<code>XAxis.get_label</code>	Return the axis label as a Text instance
<code>XAxis.get_path_effects</code>	
<code>XAxis.get_picker</code>	Return the picker object used by this artist.
<code>XAxis.get_rasterized</code>	Return whether the artist is to be rasterized.
<code>XAxis.get_sketch_params</code>	Returns the sketch parameters for the artist.
<code>XAxis.get_snap</code>	Returns the snap setting which may be:
<code>XAxis.get_transform</code>	Return the <i>Transform</i> instance used by this artist.
<code>XAxis.get_transformed_clip_path_and_affine</code>	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
<code>XAxis.get_url</code>	Returns the url.
<code>XAxis.get_visible</code>	Return the artist's visibility
<code>XAxis.get_window_extent</code>	Get the axes bounding box in display space.
<code>XAxis.get_zorder</code>	Return the artist's zorder.
<code>XAxis.have_units</code>	Return <i>True</i> if units are set on the x or y axes
<code>XAxis.is_transform_set</code>	Returns <i>True</i> if Artist has a transform explicitly set.
<code>XAxis.mouseover</code>	

Continued on next page

Table 132 – continued from previous page

<code>XAxis.pchanged</code>	Fire an event when property changed, calling all of the registered callbacks.
<code>XAxis.pick</code>	Process pick event
<code>XAxis.pickable</code>	Return <i>True</i> if <i>Artist</i> is pickable.
<code>XAxis.properties</code>	return a dictionary mapping property name -> value for all <i>Artist</i> props
<code>XAxis.remove</code>	Remove the artist from the figure if possible.
<code>XAxis.remove_callback</code>	Remove a callback based on its <i>id</i> .
<code>XAxis.set</code>	A property batch setter.
<code>XAxis.set_agg_filter</code>	Set the agg filter.
<code>XAxis.set_alpha</code>	Set the alpha value used for blending - not supported on all backends.
<code>XAxis.set_animated</code>	Set the artist's animation state.
<code>XAxis.set_clip_box</code>	Set the artist's clip <i>Bbox</i> .
<code>XAxis.set_clip_on</code>	Set whether artist uses clipping.
<code>XAxis.set_clip_path</code>	Set the artist's clip path, which may be:
<code>XAxis.set_contains</code>	Replace the contains test used by this artist.
<code>XAxis.set_figure</code>	Set the <i>Figure</i> instance the artist belongs to.
<code>XAxis.set_gid</code>	Sets the (group) id for the artist.
<code>XAxis.set_label</code>	Set the label to <i>s</i> for auto legend.
<code>XAxis.set_path_effects</code>	Set the path effects.
<code>XAxis.set_picker</code>	Set the epsilon for picking used by this artist
<code>XAxis.set_rasterized</code>	Force rasterized (bitmap) drawing in vector backend output.
<code>XAxis.set_sketch_params</code>	Sets the sketch parameters.
<code>XAxis.set_snap</code>	Sets the snap setting which may be:
<code>XAxis.set_transform</code>	Set the artist transform.
<code>XAxis.set_url</code>	Sets the url for the artist.
<code>XAxis.set_visible</code>	Set the artist's visibility.
<code>XAxis.set_zorder</code>	Set the zorder for the artist.
<code>XAxis.stale</code>	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
<code>XAxis.update</code>	Update this artist's properties from the dictionary <i>prop</i> .
<code>XAxis.update_from</code>	Copy properties from <i>other</i> to <i>self</i> .
<code>XAxis.zorder</code>	
<code>YAxis.add_callback</code>	Adds a callback function that will be called whenever one of the <i>Artist</i> 's properties changes.
<code>YAxis.aname</code>	
<code>YAxis.axes</code>	The <i>Axes</i> instance the artist resides in, or <i>None</i> .
<code>YAxis.contains</code>	Test whether the mouse event occurred in the y axis.
<code>YAxis.convert_xunits</code>	For artists in an axes, if the xaxis has units support, convert <i>x</i> using xaxis unit type
<code>YAxis.convert_yunits</code>	For artists in an axes, if the yaxis has units support, convert <i>y</i> using yaxis unit type
<code>YAxis.draw</code>	Draw the axis lines, grid lines, tick lines and labels

Continued on next page

Table 132 – continued from previous page

<code>YAxis.findobj</code>	Find artist objects.
<code>YAxis.format_cursor_data</code>	Return <i>cursor data</i> string formatted.
<code>YAxis.get_agg_filter</code>	Return filter function to be used for agg filter.
<code>YAxis.get_alpha</code>	Return the alpha value used for blending - not supported on all backends
<code>YAxis.get_animated</code>	Return the artist's animated state
<code>YAxis.get_children</code>	Return a list of the child Artist's this <code>:class:`Artist</code> contains.
<code>YAxis.get_clip_box</code>	Return artist clipbox
<code>YAxis.get_clip_on</code>	Return whether artist uses clipping
<code>YAxis.get_clip_path</code>	Return artist clip path
<code>YAxis.get_contains</code>	Return the <code>_contains</code> test used by the artist, or <i>None</i> for default.
<code>YAxis.get_cursor_data</code>	Get the cursor data for a given event.
<code>YAxis.get_figure</code>	Return the <i>Figure</i> instance the artist belongs to.
<code>YAxis.get_gid</code>	Returns the group id.
<code>YAxis.get_label</code>	Return the axis label as a <i>Text</i> instance
<code>YAxis.get_path_effects</code>	
<code>YAxis.get_picker</code>	Return the picker object used by this artist.
<code>YAxis.get_rasterized</code>	Return whether the artist is to be rasterized.
<code>YAxis.get_sketch_params</code>	Returns the sketch parameters for the artist.
<code>YAxis.get_snap</code>	Returns the snap setting which may be:
<code>YAxis.get_transform</code>	Return the <i>Transform</i> instance used by this artist.
<code>YAxis.get_transformed_clip_path_and_affine</code>	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
<code>YAxis.get_url</code>	Returns the url.
<code>YAxis.get_visible</code>	Return the artist's visibility
<code>YAxis.get_window_extent</code>	Get the axes bounding box in display space.
<code>YAxis.get_zorder</code>	Return the artist's zorder.
<code>YAxis.have_units</code>	Return <i>True</i> if units are set on the x or y axes
<code>YAxis.is_transform_set</code>	Returns <i>True</i> if Artist has a transform explicitly set.
<code>YAxis.mouseover</code>	
<code>YAxis.pchanged</code>	Fire an event when property changed, calling all of the registered callbacks.
<code>YAxis.pick</code>	Process pick event
<code>YAxis.pickable</code>	Return <i>True</i> if Artist is pickable.
<code>YAxis.properties</code>	return a dictionary mapping property name -> value for all Artist props
<code>YAxis.remove</code>	Remove the artist from the figure if possible.
<code>YAxis.remove_callback</code>	Remove a callback based on its <i>id</i> .
<code>YAxis.set</code>	A property batch setter.
<code>YAxis.set_agg_filter</code>	Set the agg filter.
<code>YAxis.set_alpha</code>	Set the alpha value used for blending - not supported on all backends.
<code>YAxis.set_animated</code>	Set the artist's animation state.
<code>YAxis.set_clip_box</code>	Set the artist's clip <i>Bbox</i> .

Continued on next page

Table 132 – continued from previous page

<code>YAxis.set_clip_on</code>	Set whether artist uses clipping.
<code>YAxis.set_clip_path</code>	Set the artist's clip path, which may be:
<code>YAxis.set_contains</code>	Replace the contains test used by this artist.
<code>YAxis.set_figure</code>	Set the <i>Figure</i> instance the artist belongs to.
<code>YAxis.set_gid</code>	Sets the (group) id for the artist.
<code>YAxis.set_label</code>	Set the label to <i>s</i> for auto legend.
<code>YAxis.set_path_effects</code>	Set the path effects.
<code>YAxis.set_picker</code>	Set the epsilon for picking used by this artist
<code>YAxis.set_rasterized</code>	Force rasterized (bitmap) drawing in vector backend output.
<code>YAxis.set_sketch_params</code>	Sets the sketch parameters.
<code>YAxis.set_snap</code>	Sets the snap setting which may be:
<code>YAxis.set_transform</code>	Set the artist transform.
<code>YAxis.set_url</code>	Sets the url for the artist.
<code>YAxis.set_visible</code>	Set the artist's visibility.
<code>YAxis.set_zorder</code>	Set the zorder for the artist.
<code>YAxis.stale</code>	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
<code>YAxis.update</code>	Update this artist's properties from the dictionary <i>prop</i> .
<code>YAxis.update_from</code>	Copy properties from <i>other</i> to <i>self</i> .
<code>YAxis.zorder</code>	

**matplotlib.axis.Axis.add\_callback****Axis.add\_callback(*func*)**

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

**matplotlib.axis.Axis.aname**

`Axis.aname = 'Artist'`

**matplotlib.axis.Axis.axes****Axis.axes**

The *Axes* instance the artist resides in, or *None*.

**matplotlib.axis.Axis.contains****Axis.contains(*mouseevent*)**

Test whether the artist contains the mouse event.

Returns the truth value and a dictionary of artist specific details of selection, such as which points are contained in the pick radius. See individual artists for details.

### matplotlib.axis.Axis.convert\_xunits

Axis.convert\_xunits(x)

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

### matplotlib.axis.Axis.convert\_yunits

Axis.convert\_yunits(y)

For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

### matplotlib.axis.Axis.draw

Axis.draw(renderer, \*args, \*\*kwargs)

Draw the axis lines, grid lines, tick lines and labels

### matplotlib.axis.Axis.findobj

Axis.findobj(match=None, include\_self=True)

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

### matplotlib.axis.Axis.format\_cursor\_data

Axis.format\_cursor\_data(data)

Return *cursor data* string formatted.

### matplotlib.axis.Axis.get\_agg\_filter

Axis.get\_agg\_filter()

Return filter function to be used for agg filter.

### matplotlib.axis.Axis.get\_alpha

Axis.get\_alpha()

Return the alpha value used for blending - not supported on all backends

**matplotlib.axis.Axis.get\_animated**

`Axis.get_animated()`  
Return the artist's animated state

**matplotlib.axis.Axis.get\_children**

`Axis.get_children()`  
Return a list of the child Artist's this :class:`Artist` contains.

**matplotlib.axis.Axis.get\_clip\_box**

`Axis.get_clip_box()`  
Return artist clipbox

**matplotlib.axis.Axis.get\_clip\_on**

`Axis.get_clip_on()`  
Return whether artist uses clipping

**matplotlib.axis.Axis.get\_clip\_path**

`Axis.get_clip_path()`  
Return artist clip path

**matplotlib.axis.Axis.get\_contains**

`Axis.get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

**matplotlib.axis.Axis.get\_cursor\_data**

`Axis.get_cursor_data(event)`  
Get the cursor data for a given event.

**matplotlib.axis.Axis.get\_figure**

`Axis.get_figure()`  
Return the *Figure* instance the artist belongs to.

**matplotlib.axis.Axis.get\_gid**

`Axis.get_gid()`  
Returns the group id.

### matplotlib.axis.Axis.get\_label

`Axis.get_label()`  
Return the axis label as a Text instance

### matplotlib.axis.Axis.get\_path\_effects

`Axis.get_path_effects()`

### matplotlib.axis.Axis.get\_picker

`Axis.get_picker()`  
Return the picker object used by this artist.

### matplotlib.axis.Axis.get\_rasterized

`Axis.get_rasterized()`  
Return whether the artist is to be rasterized.

### matplotlib.axis.Axis.get\_sketch\_params

`Axis.get_sketch_params()`  
Returns the sketch parameters for the artist.

#### Returns

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.
- **randomness**: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

### matplotlib.axis.Axis.get\_snap

`Axis.get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**matplotlib.axis.Axis.get\_transform**

`Axis.get_transform()`  
Return the *Transform* instance used by this artist.

**matplotlib.axis.Axis.get\_transformed\_clip\_path\_and\_affine**

`Axis.get_transformed_clip_path_and_affine()`  
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**matplotlib.axis.Axis.get\_url**

`Axis.get_url()`  
Returns the url.

**matplotlib.axis.Axis.get\_visible**

`Axis.get_visible()`  
Return the artist's visibility

**matplotlib.axis.Axis.get\_window\_extent**

`Axis.get_window_extent(renderer)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

**matplotlib.axis.Axis.get\_zorder**

`Axis.get_zorder()`  
Return the artist's zorder.

**matplotlib.axis.Axis.have\_units**

`Axis.have_units()`  
Return *True* if units are set on the x or y axes

### **matplotlib.axis.Axis.is\_transform\_set**

`Axis.is_transform_set()`  
Returns *True* if Artist has a transform explicitly set.

### **matplotlib.axis.Axis.mouseover**

`Axis.mouseover`

### **matplotlib.axis.Axis.pchanged**

`Axis.pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

### **matplotlib.axis.Axis.pick**

`Axis.pick(mouseevent)`  
Process pick event  
each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

### **matplotlib.axis.Axis.pickable**

`Axis.pickable()`  
Return *True* if Artist is pickable.

### **matplotlib.axis.Axis.properties**

`Axis.properties()`  
return a dictionary mapping property name -> value for all Artist props

### **matplotlib.axis.Axis.remove**

`Axis.remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

---

**matplotlib.axis.Axis.remove\_callback**

`Axis.remove_callback(oid)`  
Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

**matplotlib.axis.Axis.set**

`Axis.set(**kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

**matplotlib.axis.Axis.set\_agg\_filter**

`Axis.set_agg_filter(filter_func)`  
Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**matplotlib.axis.Axis.set\_alpha**

`Axis.set_alpha(alpha)`  
Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float]

**matplotlib.axis.Axis.set\_animated**

`Axis.set_animated(b)`  
Set the artist's animation state.

**Parameters**

**b** [bool]

**matplotlib.axis.Axis.set\_clip\_box**

`Axis.set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

**matplotlib.axis.Axis.set\_clip\_on**`Axis.set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters****b** [bool]**matplotlib.axis.Axis.set\_clip\_path**`Axis.set_clip_path(clippath, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]**matplotlib.axis.Axis.set\_contains**`Axis.set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.**Parameters****picker** [callable]**matplotlib.axis.Axis.set\_figure**`Axis.set_figure(fig)`Set the *Figure* instance the artist belongs to.**Parameters****fig** [*Figure*]

**matplotlib.axis.Axis.set\_gid**

`Axis.set_gid(gid)`  
Sets the (group) id for the artist.

**Parameters**

**gid** [str]

**matplotlib.axis.Axis.set\_label**

`Axis.set_label(s)`  
Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling `str`.

**matplotlib.axis.Axis.set\_path\_effects**

`Axis.set_path_effects(path_effects)`  
Set the path effects.

**Parameters**

**path\_effects** [*AbstractPathEffect*]

**matplotlib.axis.Axis.set\_picker**

`Axis.set_picker(picker)`  
Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return `hit=True` and `props` is a dictionary of properties you want added to the `PickEvent` attributes.

**Parameters**

**picker** [None or bool or float or callable]

### matplotlib.axis.Axis.set\_rasterized

Axis.set\_rasterized(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

### matplotlib.axis.Axis.set\_sketch\_params

Axis.set\_sketch\_params(*scale=None, length=None, randomness=None*)

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

### matplotlib.axis.Axis.set\_snap

Axis.set\_snap(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None]

### matplotlib.axis.Axis.set\_transform

Axis.set\_transform(*t*)

Set the artist transform.

#### Parameters

**t** [*Transform*]

**matplotlib.axis.Axis.set\_url**

`Axis.set_url(url)`  
Sets the url for the artist.

**Parameters**

**url** [str]

**matplotlib.axis.Axis.set\_visible**

`Axis.set_visible(b)`  
Set the artist's visibility.

**Parameters**

**b** [bool]

**matplotlib.axis.Axis.set\_zorder**

`Axis.set_zorder(level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

**matplotlib.axis.Axis.stale**

`Axis.stale`  
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**matplotlib.axis.Axis.update**

`Axis.update(props)`  
Update this artist's properties from the dictionary *prop*.

**matplotlib.axis.Axis.update\_from**

`Axis.update_from(other)`  
Copy properties from *other* to *self*.

**matplotlib.axis.Axis.zorder**

`Axis.zorder = 0`

### matplotlib.axis.XAxis.add\_callback

`XAxis.add_callback(func)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

### matplotlib.axis.XAxis.aname

`XAxis.aname = 'Artist'`

### matplotlib.axis.XAxis.axes

`XAxis.axes`

The *Axes* instance the artist resides in, or *None*.

### matplotlib.axis.XAxis.contains

`XAxis.contains(mouseevent)`

Test whether the mouse event occurred in the x axis.

### matplotlib.axis.XAxis.convert\_xunits

`XAxis.convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

### matplotlib.axis.XAxis.convert\_yunits

`XAxis.convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

### matplotlib.axis.XAxis.draw

`XAxis.draw(renderer, *args, **kwargs)`

Draw the axis lines, grid lines, tick lines and labels

### matplotlib.axis.XAxis.findobj

`XAxis.findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- *None*: return all objects contained in artist.

- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If `include_self` is `True` (default), include `self` in the list to be checked for a match.

#### **matplotlib.axis.XAxis.format\_cursor\_data**

`XAxis.format_cursor_data(data)`  
Return *cursor data* string formatted.

#### **matplotlib.axis.XAxis.get\_agg\_filter**

`XAxis.get_agg_filter()`  
Return filter function to be used for agg filter.

#### **matplotlib.axis.XAxis.get\_alpha**

`XAxis.get_alpha()`  
Return the alpha value used for blending - not supported on all backends

#### **matplotlib.axis.XAxis.get\_animated**

`XAxis.get_animated()`  
Return the artist's animated state

#### **matplotlib.axis.XAxis.get\_children**

`XAxis.get_children()`  
Return a list of the child `Artist`s` this `:class:`Artist`` contains.

#### **matplotlib.axis.XAxis.get\_clip\_box**

`XAxis.get_clip_box()`  
Return artist clipbox

#### **matplotlib.axis.XAxis.get\_clip\_on**

`XAxis.get_clip_on()`  
Return whether artist uses clipping

#### **matplotlib.axis.XAxis.get\_clip\_path**

`XAxis.get_clip_path()`  
Return artist clip path

**matplotlib.axis.XAxis.get\_contains**

`XAxis.get_contains()`

Return the `_contains` test used by the artist, or *None* for default.

**matplotlib.axis.XAxis.get\_cursor\_data**

`XAxis.get_cursor_data(event)`

Get the cursor data for a given event.

**matplotlib.axis.XAxis.get\_figure**

`XAxis.get_figure()`

Return the *Figure* instance the artist belongs to.

**matplotlib.axis.XAxis.get\_gid**

`XAxis.get_gid()`

Returns the group id.

**matplotlib.axis.XAxis.get\_label**

`XAxis.get_label()`

Return the axis label as a *Text* instance

**matplotlib.axis.XAxis.get\_path\_effects**

`XAxis.get_path_effects()`

**matplotlib.axis.XAxis.get\_picker**

`XAxis.get_picker()`

Return the picker object used by this artist.

**matplotlib.axis.XAxis.get\_rasterized**

`XAxis.get_rasterized()`

Return whether the artist is to be rasterized.

**matplotlib.axis.XAxis.get\_sketch\_params**`XAxis.get_sketch_params()`

Returns the sketch parameters for the artist.

**Returns****sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.**matplotlib.axis.XAxis.get\_snap**`XAxis.get_snap()`

Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**matplotlib.axis.XAxis.get\_transform**`XAxis.get_transform()`Return the *Transform* instance used by this artist.**matplotlib.axis.XAxis.get\_transformed\_clip\_path\_and\_affine**`XAxis.get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

**matplotlib.axis.XAxis.get\_url**`XAxis.get_url()`

Returns the url.

**matplotlib.axis.XAxis.get\_visible**`XAxis.get_visible()`

Return the artist's visibility

### **matplotlib.axis.XAxis.get\_window\_extent**

`XAxis.get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

### **matplotlib.axis.XAxis.get\_zorder**

`XAxis.get_zorder()`

Return the artist's zorder.

### **matplotlib.axis.XAxis.have\_units**

`XAxis.have_units()`

Return *True* if units are set on the x or y axes

### **matplotlib.axis.XAxis.is\_transform\_set**

`XAxis.is_transform_set()`

Returns *True* if Artist has a transform explicitly set.

### **matplotlib.axis.XAxis.mouseover**

`XAxis.mouseover`

### **matplotlib.axis.XAxis.pchanged**

`XAxis.pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

### **matplotlib.axis.XAxis.pick**

`XAxis.pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

**matplotlib.axis.XAxis.pickable**

`XAxis.pickable()`  
Return *True* if Artist is pickable.

**matplotlib.axis.XAxis.properties**

`XAxis.properties()`  
return a dictionary mapping property name -> value for all Artist props

**matplotlib.axis.XAxis.remove**

`XAxis.remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**matplotlib.axis.XAxis.remove\_callback**

`XAxis.remove_callback(oid)`  
Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

**matplotlib.axis.XAxis.set**

`XAxis.set(**kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

**matplotlib.axis.XAxis.set\_agg\_filter**

`XAxis.set_agg_filter(filter_func)`  
Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**matplotlib.axis.XAxis.set\_alpha**`XAxis.set_alpha(alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float]

**matplotlib.axis.XAxis.set\_animated**`XAxis.set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

**matplotlib.axis.XAxis.set\_clip\_box**`XAxis.set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

**matplotlib.axis.XAxis.set\_clip\_on**`XAxis.set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

**matplotlib.axis.XAxis.set\_clip\_path**`XAxis.set_clip_path(clippath, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

**matplotlib.axis.XAxis.set\_contains**`XAxis.set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit* = *True* and *props* is a dictionary of properties you want returned with the contains test.

**Parameters**

**picker** [callable]

**matplotlib.axis.XAxis.set\_figure**`XAxis.set_figure(fig)`

Set the *Figure* instance the artist belongs to.

**Parameters**

**fig** [*Figure*]

**matplotlib.axis.XAxis.set\_gid**`XAxis.set_gid(gid)`

Sets the (group) id for the artist.

**Parameters**

**gid** [str]

**matplotlib.axis.XAxis.set\_label**`XAxis.set_label(s)`

Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling `str`.

**matplotlib.axis.XAxis.set\_path\_effects**`XAxis.set_path_effects(path_effects)`

Set the path effects.

**Parameters**

**path\_effects** [*AbstractPathEffect*]

**matplotlib.axis.XAxis.set\_picker**`XAxis.set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the `PickEvent` attributes.**Parameters****picker** [None or bool or float or callable]**matplotlib.axis.XAxis.set\_rasterized**`XAxis.set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to *None*, which implies the backend's default behavior.**Parameters****rasterized** [bool or None]**matplotlib.axis.XAxis.set\_sketch\_params**`XAxis.set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters****scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If *scale* is *None*, or not provided, no sketch filter will be provided.**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

---

**matplotlib.axis.XAxis.set\_snap****XAxis.set\_snap(*snap*)**

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**Parameters****snap** [bool or None]**matplotlib.axis.XAxis.set\_transform****XAxis.set\_transform(*t*)**

Set the artist transform.

**Parameters****t** [*Transform*]**matplotlib.axis.XAxis.set\_url****XAxis.set\_url(*url*)**

Sets the url for the artist.

**Parameters****url** [str]**matplotlib.axis.XAxis.set\_visible****XAxis.set\_visible(*b*)**

Set the artist's visibility.

**Parameters****b** [bool]**matplotlib.axis.XAxis.set\_zorder****XAxis.set\_zorder(*level*)**

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level** [float]

### matplotlib.axis.XAxis.stale

XAxis.stale

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

### matplotlib.axis.XAxis.update

XAxis.update(*props*)

Update this artist's properties from the dictionary *prop*.

### matplotlib.axis.XAxis.update\_from

XAxis.update\_from(*other*)

Copy properties from *other* to *self*.

### matplotlib.axis.XAxis.zorder

XAxis.zorder = 0

### matplotlib.axis.YAxis.add\_callback

YAxis.add\_callback(*func*)

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with *remove\_callback()* later.

### matplotlib.axis.YAxis.aname

YAxis.aname = 'Artist'

### matplotlib.axis.YAxis.axes

YAxis.axes

The *Axes* instance the artist resides in, or *None*.

### matplotlib.axis.YAxis.contains

YAxis.contains(*mouseevent*)

Test whether the mouse event occurred in the y axis.

Returns *True* | *False*

**matplotlib.axis.YAxis.convert\_xunits**`YAxis.convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

**matplotlib.axis.YAxis.convert\_yunits**`YAxis.convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

**matplotlib.axis.YAxis.draw**`YAxis.draw(renderer, *args, **kwargs)`

Draw the axis lines, grid lines, tick lines and labels

**matplotlib.axis.YAxis.findobj**`YAxis.findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

**matplotlib.axis.YAxis.format\_cursor\_data**`YAxis.format_cursor_data(data)`

Return *cursor data* string formatted.

**matplotlib.axis.YAxis.get\_agg\_filter**`YAxis.get_agg_filter()`

Return filter function to be used for agg filter.

**matplotlib.axis.YAxis.get\_alpha**`YAxis.get_alpha()`

Return the alpha value used for blending - not supported on all backends

**matplotlib.axis.YAxis.get\_animated**

`YAxis.get_animated()`  
Return the artist's animated state

**matplotlib.axis.YAxis.get\_children**

`YAxis.get_children()`  
Return a list of the child Artist's this :class:`Artist` contains.

**matplotlib.axis.YAxis.get\_clip\_box**

`YAxis.get_clip_box()`  
Return artist clipbox

**matplotlib.axis.YAxis.get\_clip\_on**

`YAxis.get_clip_on()`  
Return whether artist uses clipping

**matplotlib.axis.YAxis.get\_clip\_path**

`YAxis.get_clip_path()`  
Return artist clip path

**matplotlib.axis.YAxis.get\_contains**

`YAxis.get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

**matplotlib.axis.YAxis.get\_cursor\_data**

`YAxis.get_cursor_data(event)`  
Get the cursor data for a given event.

**matplotlib.axis.YAxis.get\_figure**

`YAxis.get_figure()`  
Return the *Figure* instance the artist belongs to.

**matplotlib.axis.YAxis.get\_gid**

`YAxis.get_gid()`  
Returns the group id.

**matplotlib.axis.YAxis.get\_label**

`YAxis.get_label()`  
Return the axis label as a Text instance

**matplotlib.axis.YAxis.get\_path\_effects**

`YAxis.get_path_effects()`

**matplotlib.axis.YAxis.get\_picker**

`YAxis.get_picker()`  
Return the picker object used by this artist.

**matplotlib.axis.YAxis.get\_rasterized**

`YAxis.get_rasterized()`  
Return whether the artist is to be rasterized.

**matplotlib.axis.YAxis.get\_sketch\_params**

`YAxis.get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.
- **randomness**: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

**matplotlib.axis.YAxis.get\_snap**

`YAxis.get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

### **matplotlib.axis.YAxis.get\_transform**

`YAxis.get_transform()`  
Return the *Transform* instance used by this artist.

### **matplotlib.axis.YAxis.get\_transformed\_clip\_path\_and\_affine**

`YAxis.get_transformed_clip_path_and_affine()`  
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

### **matplotlib.axis.YAxis.get\_url**

`YAxis.get_url()`  
Returns the url.

### **matplotlib.axis.YAxis.get\_visible**

`YAxis.get_visible()`  
Return the artist's visibility

### **matplotlib.axis.YAxis.get\_window\_extent**

`YAxis.get_window_extent(renderer)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

### **matplotlib.axis.YAxis.get\_zorder**

`YAxis.get_zorder()`  
Return the artist's zorder.

### **matplotlib.axis.YAxis.have\_units**

`YAxis.have_units()`  
Return *True* if units are set on the x or y axes

**matplotlib.axis.YAxis.is\_transform\_set**`YAxis.is_transform_set()`Returns *True* if Artist has a transform explicitly set.**matplotlib.axis.YAxis.mouseover**`YAxis.mouseover`**matplotlib.axis.YAxis.pchanged**`YAxis.pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

**matplotlib.axis.YAxis.pick**`YAxis.pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set**matplotlib.axis.YAxis.pickable**`YAxis.pickable()`Return *True* if Artist is pickable.**matplotlib.axis.YAxis.properties**`YAxis.properties()`

return a dictionary mapping property name -&gt; value for all Artist props

**matplotlib.axis.YAxis.remove**`YAxis.remove()`Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

### matplotlib.axis.YAxis.remove\_callback

`YAxis.remove_callback(oid)`  
Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

### matplotlib.axis.YAxis.set

`YAxis.set(**kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

### matplotlib.axis.YAxis.set\_agg\_filter

`YAxis.set_agg_filter(filter_func)`  
Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

### matplotlib.axis.YAxis.set\_alpha

`YAxis.set_alpha(alpha)`  
Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float]

### matplotlib.axis.YAxis.set\_animated

`YAxis.set_animated(b)`  
Set the artist's animation state.

**Parameters**

**b** [bool]

### matplotlib.axis.YAxis.set\_clip\_box

`YAxis.set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

**matplotlib.axis.YAxis.set\_clip\_on**`YAxis.set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters****b** [bool]**matplotlib.axis.YAxis.set\_clip\_path**`YAxis.set_clip_path(clippath, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]**matplotlib.axis.YAxis.set\_contains**`YAxis.set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

**Parameters****picker** [callable]**matplotlib.axis.YAxis.set\_figure**`YAxis.set_figure(fig)`Set the *Figure* instance the artist belongs to.**Parameters****fig** [*Figure*]

**matplotlib.axis.YAxis.set\_gid**

`YAxis.set_gid(gid)`  
Sets the (group) id for the artist.

**Parameters**

**gid** [str]

**matplotlib.axis.YAxis.set\_label**

`YAxis.set_label(s)`  
Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling `str`.

**matplotlib.axis.YAxis.set\_path\_effects**

`YAxis.set_path_effects(path_effects)`  
Set the path effects.

**Parameters**

**path\_effects** [*AbstractPathEffect*]

**matplotlib.axis.YAxis.set\_picker**

`YAxis.set_picker(picker)`  
Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return `hit=True` and `props` is a dictionary of properties you want added to the `PickEvent` attributes.

**Parameters**

**picker** [None or bool or float or callable]

**matplotlib.axis.YAxis.set\_rasterized**`YAxis.set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters****rasterized** [bool or None]**matplotlib.axis.YAxis.set\_sketch\_params**`YAxis.set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters****scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)**matplotlib.axis.YAxis.set\_snap**`YAxis.set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**Parameters****snap** [bool or None]**matplotlib.axis.YAxis.set\_transform**`YAxis.set_transform(t)`

Set the artist transform.

**Parameters****t** [*Transform*]

**matplotlib.axis.YAxis.set\_url**

`YAxis.set_url(url)`  
Sets the url for the artist.

**Parameters**

**url** [str]

**matplotlib.axis.YAxis.set\_visible**

`YAxis.set_visible(b)`  
Set the artist's visibility.

**Parameters**

**b** [bool]

**matplotlib.axis.YAxis.set\_zorder**

`YAxis.set_zorder(level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

**matplotlib.axis.YAxis.stale**

`YAxis.stale`  
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**matplotlib.axis.YAxis.update**

`YAxis.update(props)`  
Update this artist's properties from the dictionary *prop*.

**matplotlib.axis.YAxis.update\_from**

`YAxis.update_from(other)`  
Copy properties from *other* to *self*.

**matplotlib.axis.YAxis.zorder**

`YAxis.zorder = 0`

## 18.9 backends

### 18.9.1 matplotlib.backend\_bases

Abstract base classes define the primitives that renderers and graphics contexts must implement to serve as a matplotlib backend

*RendererBase* An abstract base class to handle drawing/rendering operations.

*FigureCanvasBase* The abstraction layer that separates the *matplotlib.figure.Figure* from the backend specific details like a user interface drawing area

*GraphicsContextBase* An abstract base class that provides color, line styles, etc...

*Event* The base class for all of the matplotlib event handling. Derived classes such as *KeyEvent* and *MouseEvent* store the meta data like keys and buttons pressed, x and y locations in pixel and *Axes* coordinates.

*ShowBase* The base class for the Show class of each interactive backend; the 'show' callable is then set to `Show.__call__`, inherited from *ShowBase*.

*ToolContainerBase* The base class for the Toolbar class of each interactive backend.

*StatusbarBase* The base class for the messaging area.

```
class matplotlib.backend_bases.CloseEvent(name, canvas, guiEvent=None)
```

Bases: *matplotlib.backend\_bases.Event*

An event triggered by a figure being closed

```
class matplotlib.backend_bases.DrawEvent(name, canvas, renderer)
```

Bases: *matplotlib.backend\_bases.Event*

An event triggered by a draw operation on the canvas

In most backends callbacks subscribed to this callback will be fired after the rendering is complete but before the screen is updated. Any extra artists drawn to the canvas's renderer will be reflected without an explicit call to `blit`.

**Warning:** Calling `canvas.draw` and `canvas.blit` in these callbacks may not be safe with all backends and may cause infinite recursion.

In addition to the *Event* attributes, the following event attributes are defined:

#### Attributes

**renderer** [*RendererBase*] the renderer for the draw event

```
class matplotlib.backend_bases.Event(name, canvas, guiEvent=None)
```

Bases: `object`

A matplotlib event. Attach additional attributes as defined in *FigureCanvasBase.mpl\_connect()*. The following attributes are defined and shown with their default values

#### Attributes

**name** [str] the event name

**canvas** [*FigureCanvasBase*] the backend-specific canvas instance generating the event

**guiEvent** the GUI event that triggered the matplotlib event

```
class matplotlib.backend_bases.FigureCanvasBase(figure)
```

Bases: `object`

The canvas the figure renders into.

Public attributes

### Attributes

**figure** [*matplotlib.figure.Figure*] A high-level figure instance

```
blit(bbox=None)
```

Blit the canvas in *bbox* (default entire canvas).

```
button_press_event(x, y, button, dblclick=False, guiEvent=None)
```

Backend derived classes should call this function on any mouse button press. *x,y* are the canvas coords: 0,0 is lower, left. *button* and *key* are as defined in *MouseEvent*.

This method will be call all functions connected to the 'button\_press\_event' with a *MouseEvent* instance.

```
button_release_event(x, y, button, guiEvent=None)
```

Backend derived classes should call this function on any mouse button release.

This method will call all functions connected to the 'button\_release\_event' with a *MouseEvent* instance.

### Parameters

**x** [scalar] the canvas coordinates where 0=left

**y** [scalar] the canvas coordinates where 0=bottom

**guiEvent** the native UI event that generated the mpl event

```
close_event(guiEvent=None)
```

Pass a *CloseEvent* to all functions connected to `close_event`.

```
draw(*args, **kwargs)
```

Render the *Figure*.

```
draw_cursor(event)
```

Draw a cursor in the *event.axes* if *inaxes* is not `None`. Use native GUI drawing for efficiency if possible

```
draw_event(renderer)
```

Pass a *DrawEvent* to all functions connected to `draw_event`.

```
draw_idle(*args, **kwargs)
```

*draw()* only if idle; defaults to draw but backends can override

```
enter_notify_event(guiEvent=None, xy=None)
```

Backend derived classes should call this function when entering canvas

### Parameters

**guiEvent** the native UI event that generated the mpl event

**xy** [tuple of 2 scalars] the coordinate location of the pointer when the canvas is entered

```
events = ['resize_event', 'draw_event', 'key_press_event', 'key_release_event', 'button_press_event', ...]
```

```
filetypes = {'eps': 'Encapsulated Postscript', 'jpeg': 'Joint Photographic Experts Group', 'jpg': ...}
```

`fixed_dpi = None`

`flush_events()`  
Flush the GUI events for the figure.  
Interactive backends need to reimplement this method.

`get_default_filename()`  
Return a string, which includes extension, suitable for use as a default filename.

classmethod `get_default_filetype()`  
Get the default savefig file format as specified in rcParam `savefig.format`. Returned string excludes period. Overridden in backends that only support a single file type.

classmethod `get_supported_filetypes()`  
Return dict of savefig file formats supported by this backend

classmethod `get_supported_filetypes_grouped()`  
Return a dict of savefig file formats supported by this backend, where the keys are a file type name, such as 'Joint Photographic Experts Group', and the values are a list of filename extensions used for that filetype, such as ['jpg', 'jpeg'].

`get_width_height()`  
Return the figure width and height in points or pixels (depending on the backend), truncated to integers

`get_window_title()`  
Get the title text of the window containing the figure. Return None if there is no window (e.g., a PS backend).

`grab_mouse(ax)`  
Set the child axes which are currently grabbing the mouse events. Usually called by the widgets themselves. It is an error to call this if the mouse is already grabbed by another axes.

`is_saving()`  
Returns whether the renderer is in the process of saving to a file, rather than rendering for an on-screen buffer.

`key_press_event(key, guiEvent=None)`  
Pass a *KeyEvent* to all functions connected to `key_press_event`.

`key_release_event(key, guiEvent=None)`  
Pass a *KeyEvent* to all functions connected to `key_release_event`.

`leave_notify_event(guiEvent=None)`  
Backend derived classes should call this function when leaving canvas

### Parameters

**guiEvent** the native UI event that generated the mpl event

`motion_notify_event(x, y, guiEvent=None)`  
Backend derived classes should call this function on any motion-notify-event.  
This method will call all functions connected to the 'motion\_notify\_event' with a *MouseEvent* instance.

### Parameters

**x** [scalar] the canvas coordinates where 0=left  
**y** [scalar] the canvas coordinates where 0=bottom

**guiEvent** the native UI event that generated the mpl event

`mpl_connect(s, func)`

Connect event with string *s* to *func*. The signature of *func* is:

```
def func(event)
```

where *event* is a `matplotlib.backend_bases.Event`. The following events are recognized

- 'button\_press\_event'
- 'button\_release\_event'
- 'draw\_event'
- 'key\_press\_event'
- 'key\_release\_event'
- 'motion\_notify\_event'
- 'pick\_event'
- 'resize\_event'
- 'scroll\_event'
- 'figure\_enter\_event',
- 'figure\_leave\_event',
- 'axes\_enter\_event',
- 'axes\_leave\_event'
- 'close\_event'

For the location events (button and key press/release), if the mouse is over the axes, the variable `event.inaxes` will be set to the *Axes* the event occurs is over, and additionally, the variables `event.xdata` and `event.ydata` will be defined. This is the mouse location in data coords. See *KeyEvent* and *MouseEvent* for more info.

Return value is a connection id that can be used with `mpl_disconnect()`.

### Examples

Usage:

```
def on_press(event):  
    print('you pressed', event.button, event.xdata, event.ydata)  
  
cid = canvas.mpl_connect('button_press_event', on_press)
```

`mpl_disconnect(cid)`

Disconnect callback id *cid*

### Examples

Usage:

```
cid = canvas.mpl_connect('button_press_event', on_press)
#...later
canvas.mpl_disconnect(cid)
```

`new_timer(*args, **kwargs)`

Creates a new backend-specific subclass of `backend_bases.Timer`. This is useful for getting periodic events through the backend's native event loop. Implemented only for backends with GUIs.

### Other Parameters

**interval** [scalar] Timer interval in milliseconds

**callbacks** [List[Tuple[callable, Tuple, Dict]]] Sequence of (func, args, kwargs) where `func(*args, **kwargs)` will be executed by the timer every *interval*.

callbacks which return `False` or `0` will be removed from the timer.

### Examples

```
>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1, ), {'a': 3}),])
```

`onRemove(ev)`

Deprecated since version 2.2: The `onRemove` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Mouse event processor which removes the top artist under the cursor. Connect this to the `'mouse_press_event'` using:

```
canvas.mpl_connect('mouse_press_event', canvas.onRemove)
```

`pick(mouseevent)`

`pick_event(mouseevent, artist, **kwargs)`

This method will be called by artists who are picked and will fire off `PickEvent` callbacks registered listeners

`print_figure(filename, dpi=None, facecolor=None, edgecolor=None, orientation='portrait', format=None, *, bbox_inches=None, **kwargs)`

Render the figure to hardcopy. Set the figure patch face and edge colors. This is useful because some of the GUIs have a gray figure face color background and you'll probably want to override this on hardcopy.

### Parameters

**filename** can also be a file object on image backends

**orientation** [{'landscape', 'portrait'}, optional] only currently applies to PostScript printing.

**dpi** [scalar, optional] the dots per inch to save the figure in; if `None`, use `savefig.dpi`

**facecolor** [color spec or `None`, optional] the facecolor of the figure; if `None`, defaults to `savefig.facecolor`

**edgecolor** [color spec or `None`, optional] the edgecolor of the figure; if `None`, defaults to `savefig.edgecolor`

**format** [str, optional] when set, forcibly set the file format to save to

**bbox\_inches** [str or *Bbox*, optional] Bbox in inches. Only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure. If None, use `savefig.bbox`

**pad\_inches** [scalar, optional] Amount of padding around the figure when `bbox_inches` is 'tight'. If None, use `savefig.pad_inches`

**bbox\_extra\_artists** [list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

`release_mouse(ax)`

Release the mouse grab held by the axes, `ax`. Usually called by the widgets. It is ok to call this even if you `ax` doesn't have the mouse grab currently.

`resize(w, h)`

Set the canvas size in pixels.

`resize_event()`

Pass a *ResizeEvent* to all functions connected to `resize_event`.

`scroll_event(x, y, step, guiEvent=None)`

Backend derived classes should call this function on any scroll wheel event. `x,y` are the canvas coords: 0,0 is lower, left. `button` and `key` are as defined in *MouseEvent*.

This method will be call all functions connected to the 'scroll\_event' with a *MouseEvent* instance.

`set_window_title(title)`

Set the title text of the window containing the figure. Note that this has no effect if there is no window (e.g., a PS backend).

`start_event_loop(timeout=0)`

Start a blocking event loop.

Such an event loop is used by interactive functions, such as `ginput` and `waitforbuttonpress`, to wait for events.

The event loop blocks until a callback function triggers `stop_event_loop`, or `timeout` is reached.

If `timeout` is negative, never timeout.

Only interactive backends need to reimplement this method and it relies on `flush_events` being properly implemented.

Interactive backends should implement this in a more native way.

`stop_event_loop()`

Stop the current blocking event loop.

Interactive backends need to reimplement this to match `start_event_loop`

`supports_blit = True`

`switch_backends(FigureCanvasClass)`

Instantiate an instance of *FigureCanvasClass*

This is used for backend switching, e.g., to instantiate a *FigureCanvasPS* from a *FigureCanvasGTK*. Note, deep copying is not done, so any changes to one of the instances (e.g., setting figure size or line props), will be reflected in the other

```
class matplotlib.backend_bases.FigureManagerBase(canvas, num)
```

Bases: `object`

Helper class for pyplot mode, wraps everything up into a neat bundle

### Attributes

**canvas** [*FigureCanvasBase*] The backend-specific canvas instance

**num** [int or str] The figure number

**key\_press\_handler\_id** [int] The default key handler cid, when using the toolmanager. Can be used to disable default key press handling

```
figure.canvas.mpl_disconnect(
    figure.canvas.manager.key_press_handler_id)
```

`destroy()`

`full_screen_toggle()`

`get_window_title()`

Get the title text of the window containing the figure.

Return None for non-GUI (e.g., PS) backends.

`key_press(event)`

Implement the default mpl key bindings defined at [Navigation Keyboard Shortcuts](#)

`resize(w, h)`

"For GUI backends, resize the window (in pixels).

`set_window_title(title)`

Set the title text of the window containing the figure.

This has no effect for non-GUI (e.g., PS) backends.

`show()`

For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception to be caught by `show()`, for an optional warning.

`show_popup(msg)`

Deprecated since version 2.2: The `show_popup` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Display message in a popup - GUI only.

```
class matplotlib.backend_bases.GraphicsContextBase
```

Bases: `object`

An abstract base class that provides color, line styles, etc...

`copy_properties(gc)`

Copy properties from `gc` to self

`get_alpha()`

Return the alpha value used for blending - not supported on all backends

`get_antialiased()`

Return true if the object should try to do antialiased rendering

`get_capstyle()`

Return the capstyle as a string in ('butt', 'round', 'projecting')

`get_clip_path()`  
Return the clip path in the form (path, transform), where path is a *Path* instance, and transform is an affine transform to apply to the path before clipping.

`get_clip_rectangle()`  
Return the clip rectangle as a *Bbox* instance

`get_dashes()`  
Return the dash information as an offset dashlist tuple.  
The dash list is a even size list that gives the ink on, ink off in pixels.  
See p107 of to PostScript [BLUEBOOK](#) for more info.  
Default value is None

`get_forced_alpha()`  
Return whether the value given by `get_alpha()` should be used to override any other alpha-channel values.

`get_gid()`  
Return the object identifier if one is set, None otherwise.

`get_hatch()`  
Gets the current hatch style

`get_hatch_color()`  
Gets the color to use for hatching.

`get_hatch_linewidth()`  
Gets the linewidth to use for hatching.

`get_hatch_path(density=6.0)`  
Returns a Path for the current hatch.

`get_joinstyle()`  
Return the line join style as one of ('miter', 'round', 'bevel')

`get_linewidth()`  
Return the line width in points as a scalar

`get_rgb()`  
returns a tuple of three or four floats from 0-1.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

### Returns

**sketch\_params** [tuple or None] A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.
- **randomness**: The scale factor by which the length is shrunk or expanded.

May return *None* if no sketch parameters were set.

`get_snap()`  
returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is

- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

`get_url()`

returns a url if one is set, None otherwise

`restore()`

Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack

`set_alpha(alpha)`

Set the alpha value used for blending - not supported on all backends. If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, `alpha` will override them.

`set_antialiased(b)`

True if object should be drawn with antialiased rendering

`set_capstyle(cs)`

Set the capstyle as a string in ('butt', 'round', 'projecting')

`set_clip_path(path)`

Set the clip path and transformation. Path should be a *TransformedPath* instance.

`set_clip_rectangle(rectangle)`

Set the clip rectangle with sequence (left, bottom, width, height)

`set_dashes(dash_offset, dash_list)`

Set the dash style for the gc.

#### Parameters

**dash\_offset** [float] is the offset (usually 0).

**dash\_list** [array\_like] specifies the on-off sequence as points. (None, None) specifies a solid line

`set_foreground(fg, isRGBA=False)`

Set the foreground color. `fg` can be a MATLAB format string, a html hex color string, an rgb or rgba unit tuple, or a float between 0 and 1. In the latter case, grayscale is used.

If you know `fg` is rgba, set `isRGBA=True` for efficiency.

`set_gid(id)`

Sets the id.

`set_hatch(hatch)`

Sets the hatch style for filling

`set_hatch_color(hatch_color)`

sets the color to use for hatching.

`set_joinstyle(js)`

Set the join style to be one of ('miter', 'round', 'bevel')

`set_linewidth(w)`

Set the linewidth in points

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

`set_url(url)`

Sets the url for links in compatible backends

```
class matplotlib.backend_bases.KeyEvent(name, canvas, key, x=0, y=0, guiEvent=None)
```

Bases: `matplotlib.backend_bases.LocationEvent`

A key event (key press, key release).

Attach additional attributes as defined in `FigureCanvasBase.mpl_connect()`.

In addition to the `Event` and `LocationEvent` attributes, the following attributes are defined:

### Notes

Modifier keys will be prefixed to the pressed key and will be in the order "ctrl", "alt", "super". The exception to this rule is when the pressed key is itself a modifier key, therefore "ctrl+alt" and "alt+control" can both be valid key values.

### Examples

Usage:

```
def on_key(event):
    print('you pressed', event.key, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('key_press_event', on_key)
```

### Attributes

**key** [None or str] the key(s) pressed. Could be **None**, a single case sensitive ascii character ("g", "G", "#", etc.), a special key ("control", "shift", "f1", "up", etc.) or a combination of the above (e.g., "ctrl+alt+g", "ctrl+alt+G").

```
class matplotlib.backend_bases.LocationEvent(name, canvas, x, y, guiEvent=None)
```

Bases: `matplotlib.backend_bases.Event`

An event that has a screen location.

The following additional attributes are defined and shown with their default values.

In addition to the *Event* attributes, the following event attributes are defined:

### Attributes

**x** [scalar] x position - pixels from left of canvas

**y** [scalar] y position - pixels from bottom of canvas

**inaxes** [bool] the *Axes* instance if mouse is over axes

**xdata** [scalar] x coord of mouse in data coords

**ydata** [scalar] y coord of mouse in data coords

x, y in figure coords, 0,0 = bottom, left

lastevent = None

```
class matplotlib.backend_bases.MouseEvent(name, canvas, x, y, button=None,
                                         key=None, step=0, dblclick=False,
                                         guiEvent=None)
```

Bases: *matplotlib.backend\_bases.LocationEvent*

**A mouse event ('button\_press\_event', 'button\_release\_event', 'scroll\_event', 'motion\_notify\_event').**

In addition to the *Event* and *LocationEvent* attributes, the following attributes are defined:

### Examples

Usage:

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('button_press_event', on_press)
```

### Attributes

**button** [{None, 1, 2, 3, 'up', 'down'}] The button pressed. 'up' and 'down' are used for scroll events. Note that in the nbagg backend, both the middle and right clicks return 3 since right clicking will bring up the context menu in some browsers.

**key** [None or str] The key pressed when the mouse event triggered, e.g. 'shift'. See *KeyEvent*.

**step** [scalar] The Number of scroll steps (positive for 'up', negative for 'down').

**dblclick** [bool] *True* if the event is a double-click.

x, y in figure coords, 0,0 = bottom, left button pressed None, 1, 2, 3, 'up', 'down'

```
class matplotlib.backend_bases.NavigationToolbar2(canvas)
    Bases: object
```

Base class for the navigation cursor, version 2

backends must implement a canvas that handles connections for 'button\_press\_event' and 'button\_release\_event'. See `FigureCanvasBase.mpl_connect()` for more information

They must also define

- `save_figure()` save the current figure
- `set_cursor()` if you want the pointer icon to change
- `_init_toolbar()` create your toolbar widget
- `draw_rubberband()` **(optional)** draw the zoom to rect "rubberband" rectangle
- `press()` **(optional)** whenever a mouse button is pressed, you'll be notified with the event
- `release()` **(optional)** whenever a mouse button is released, you'll be notified with the event
- `set_message()` **(optional)** display message
- `set_history_buttons()` **(optional)** you can change the history back / forward buttons to indicate disabled / enabled state.

That's it, we'll do the rest!

- `back(*args)`  
move back up the view lim stack
- `drag_pan(event)`  
Callback for dragging in pan/zoom mode.
- `drag_zoom(event)`  
Callback for dragging in zoom mode.
- `draw()`  
Redraw the canvases, update the locators.
- `draw_rubberband(event, x0, y0, x1, y1)`  
Draw a rectangle rubberband to indicate zoom limits.  
  
Note that it is not guaranteed that  $x_0 \leq x_1$  and  $y_0 \leq y_1$ .
- `forward(*args)`  
Move forward in the view lim stack.
- `home(*args)`  
Restore the original view.
- `mouse_move(event)`
- `pan(*args)`  
Activate the pan/zoom tool. pan with left button, zoom with right
- `press(event)`  
Called whenever a mouse button is pressed.
- `press_pan(event)`  
Callback for mouse button press in pan/zoom mode.
- `press_zoom(event)`  
Callback for mouse button press in zoom to rect mode.
- `push_current()`  
Push the current view limits and position onto the stack.

`release(event)`  
 Callback for mouse button release.

`release_pan(event)`  
 Callback for mouse button release in pan/zoom mode.

`release_zoom(event)`  
 Callback for mouse button release in zoom to rect mode.

`remove_rubberband()`  
 Remove the rubberband.

`save_figure(*args)`  
 Save the current figure.

`set_cursor(cursor)`  
 Set the current cursor to one of the `Cursors` enums values.

If required by the backend, this method should trigger an update in the backend event loop after the cursor is set, as this method may be called e.g. before a long-running task during which the GUI is not updated.

`set_history_buttons()`  
 Enable or disable the back/forward button.

`set_message(S)`  
 Display a message on toolbar or in status bar.

`toolitems = (('Home', 'Reset original view', 'home', 'home'), ('Back', 'Back to previous view', 'ba`

`update()`  
 Reset the axes stack.

`zoom(*args)`  
 Activate zoom to rect mode.

`exception matplotlib.backend_bases.NonGuiException`  
 Bases: `Exception`

`class matplotlib.backend_bases.PickEvent(name, canvas, mouseevent, artist, guiEvent=None, **kwargs)`  
 Bases: `matplotlib.backend_bases.Event`

a pick event, fired when the user picks a location on the canvas sufficiently close to an artist.

Attrs: all the `Event` attributes plus

## Examples

Usage:

```
ax.plot(np.rand(100), 'o', picker=5) # 5 points tolerance

def on_pick(event):
    line = event.artist
    xdata, ydata = line.get_data()
    ind = event.ind
    print('on pick line:', np.array([xdata[ind], ydata[ind]]).T)

cid = fig.canvas.mpl_connect('pick_event', on_pick)
```

## Attributes

**mouseevent** [*MouseEvent*] the mouse event that generated the pick

**artist** [*matplotlib.artist.Artist*] the picked artist

**other** extra class dependent attrs - e.g., a *Line2D* pick may define different extra attributes than a *PatchCollection* pick event

```
class matplotlib.backend_bases.RendererBase
    Bases: object
```

An abstract base class to handle drawing/rendering operations.

The following methods must be implemented in the backend for full functionality (though just implementing *draw\_path()* alone would give a highly capable backend):

- *draw\_path()*
- *draw\_image()*
- *draw\_gouraud\_triangle()*

The following methods *should* be implemented in the backend for optimization reasons:

- *draw\_text()*
- *draw\_markers()*
- *draw\_path\_collection()*
- *draw\_quad\_mesh()*

```
close_group(s)
```

Close a grouping element with label *s* Is only currently used by *backend\_svg*

```
draw_gouraud_triangle(gc, points, colors, transform)
```

Draw a Gouraud-shaded triangle.

### Parameters

**points** [array\_like, shape=(3, 2)] Array of (x, y) points for the triangle.

**colors** [array\_like, shape=(3, 4)] RGBA colors for each point of the triangle.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```
draw_gouraud_triangles(gc, triangles_array, colors_array, transform)
```

Draws a series of Gouraud triangles.

### Parameters

**points** [array\_like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.

**colors** [array\_like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```
draw_image(gc, x, y, im, transform=None)
```

Draw an RGBA image.

### Parameters

- gc** [*GraphicsContextBase*] a graphics context with clipping information.
- x** [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- y** [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- im** [array\_like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option\_scale\_image()* returns True, an affine transformation *may* be passed to *draw\_image()*. It takes the form of a *Affine2DBase* instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_markers(gc, marker_path, marker_trans, path, trans, rgbFace=None)`

Draws a marker at each of the vertices in *path*. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

- gc** [*GraphicsContextBase*] The graphics context
- marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.
- trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_path(gc, path, transform, rgbFace=None)`

Draws a *Path* instance using the given affine transform.

`draw_path_collection(gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgcolors, linewidths, linestyle, antialiaseds, urls, offset_position)`

Draws a collection of paths selecting drawing properties from the lists *facecolors*, *edgcolors*, *linewidths*, *linestyle* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied. *offset\_position* may be either "screen" or "data" depending on the space that the offsets are in.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

`draw_quad_mesh(gc, master transform, meshWidth, meshHeight, coordinates, offsets, offsetTrans, facecolors, antialiased, edgcolors)`

This provides a fallback implementation of `draw_quad_mesh()` that generates paths and then calls `draw_path_collection()`.

`draw_tex(gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)`

`draw_text(gc, x, y, s, prop, angle, ismath=False, mtext=None)`

Draw the text instance

### Parameters

**gc** [*GraphicsContextBase*] the graphics context

**x** [scalar] the x location of the text in display coords

**y** [scalar] the y location of the text baseline in display coords

**s** [str] the text string

**prop** [*matplotlib.font\_manager.FontProperties*] font properties

**angle** [scalar] the rotation angle in degrees

**mtext** [*matplotlib.text.Text*] the original text object to be rendered

### Notes

#### backend implementers note

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`flipy()`

Return true if y small numbers are top for renderer Is used for drawing text (*matplotlib.text*) and images (*matplotlib.image*) only

`get_canvas_width_height()`

return the canvas width and height in display coords

`get_image_magnification()`

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

`get_texmanager()`

return the `matplotlib.texmanager.TextManager` instance

`get_text_width_height_descent(s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string `s` with *FontProperties* `prop`

`new_gc()`

Return an instance of a *GraphicsContextBase*

`open_group(s, gid=None)`

Open a grouping element with label `s`. If `gid` is given, use `gid` as the id of the group. Is only currently used by *backend\_svg*.

`option_image_nocomposite()`  
 override this method for renderers that do not necessarily always want to rescale and composite raster images. (like SVG, PDF, or PS)

`option_scale_image()`  
 override this method for renderers that support arbitrary affine transformations in `draw_image()` (most vector backends).

`points_to_pixels(points)`  
 Convert points to display units

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72.0 * dpi/72.0
```

### Parameters

**points** [scalar or array\_like] a float or a numpy array of float

### Returns

**Points converted to pixels**

`start_filter()`  
 Used in AggRenderer. Switch to a temporary renderer for image filtering effects.

`start_rasterizing()`  
 Used in MixedModeRenderer. Switch to the raster renderer.

`stop_filter(filter_func)`  
 Used in AggRenderer. Switch back to the original renderer. The contents of the temporary renderer is processed with the `filter_func` and is drawn on the original renderer as an image.

`stop_rasterizing()`  
 Used in MixedModeRenderer. Switch back to the vector renderer and draw the contents of the raster renderer as an image on the vector renderer.

`strip_math(s)`

`class matplotlib.backend_bases.ResizeEvent(name, canvas)`

Bases: `matplotlib.backend_bases.Event`

An event triggered by a canvas resize

In addition to the `Event` attributes, the following event attributes are defined:

### Attributes

**width** [scalar] width of the canvas in pixels

**height** [scalar] height of the canvas in pixels

`class matplotlib.backend_bases.ShowBase`

Bases: `matplotlib.backend_bases._Backend`

Simple base class to generate a `show()` callable in backends.

Subclass must override `mainloop()` method.

`class matplotlib.backend_bases.StatusbarBase(toolmanager)`

Bases: `object`

Base class for the statusbar

`set_message(s)`

Display a message on toolbar or in status bar

### Parameters

**s** [str] Message text

`class matplotlib.backend_bases.TimerBase(interval=None, callbacks=None)`

Bases: `object`

A base class for providing timer events, useful for things animations. Backends need to implement a few specific methods in order to use their own timing mechanisms so that the timer events are integrated into their event loops.

Mandatory functions that must be implemented:

- `_timer_start`: Contains backend-specific code for starting the timer
- `_timer_stop`: Contains backend-specific code for stopping the timer

Optional overrides:

- `_timer_set_single_shot`: Code for setting the timer to single shot operating mode, if supported by the timer object. If not, the `Timer` class itself will store the flag and the `_on_timer` method should be overridden to support such behavior.
- `_timer_set_interval`: Code for setting the interval on the timer, if there is a method for doing so on the timer object.
- `_on_timer`: This is the internal function that any timer object should call, which will handle the task of running all callbacks that have been set.

### Attributes

**interval** [scalar] The time between timer events in milliseconds. Default is 1000 ms.

**single\_shot** [bool] Boolean flag indicating whether this timer should operate as single shot (run once and then stop). Defaults to `False`.

**callbacks** [List[Tuple[callable, Tuple, Dict]]] Stores list of (func, args, kwargs) tuples that will be called upon timer events. This list can be manipulated directly, or the functions `add_callback` and `remove_callback` can be used.

`add_callback(func, *args, **kwargs)`

Register `func` to be called by timer when the event fires. Any additional arguments provided will be passed to `func`.

`interval`

`remove_callback(func, *args, **kwargs)`

Remove `func` from list of callbacks. `args` and `kwargs` are optional and used to distinguish between copies of the same function registered to be called with different arguments.

`single_shot`

`start(interval=None)`

Start the timer object. `interval` is optional and will be used to reset the timer interval first if provided.

`stop()`  
Stop the timer.

`class matplotlib.backend_bases.ToolContainerBase(toolmanager)`

Bases: `object`

Base class for all tool containers, e.g. toolbars.

### Attributes

**toolmanager** [`ToolManager`] The tools with which this `ToolContainer` wants to communicate.

`add_tool(tool, group, position=-1)`

Adds a tool to this container

### Parameters

**tool** [`tool_like`] The tool to add, see `ToolManager.get_tool`.

**group** [`str`] The name of the group to add this tool to.

**position** [`int` (optional)] The position within the group to place this tool. Defaults to end.

`add_toolitem(name, group, position, image, description, toggle)`

Add a toolitem to the container

This method must get implemented per backend

The callback associated with the button click event, must be **EXACTLY** `self.trigger_tool(name)`

### Parameters

**name** [`string`] Name of the tool to add, this gets used as the tool's ID and as the default label of the buttons

**group** [`String`] Name of the group that this tool belongs to

**position** [`Int`] Position of the tool within its group, if -1 it goes at the End

**image\_file** [`String`] Filename of the image for the button or `None`

**description** [`String`] Description of the tool, used for the tooltips

**toggle** [`Bool`]

- `True` : The button is a toggle (change the pressed/unpressed state between consecutive clicks)
- `False` : The button is a normal button (returns to unpressed state after release)

`remove_toolitem(name)`

Remove a toolitem from the `ToolContainer`

This method must get implemented per backend

Called when `ToolManager` emits a `tool_removed_event`

### Parameters

**name** [`string`] Name of the tool to remove

`toggle_toolitem(name, toggled)`

Toggle the toolitem without firing event

**Parameters****name** [String] Id of the tool to toggle**toggled** [bool] Whether to set this tool as toggled or not.`trigger_tool(name)`  
Trigger the tool**Parameters****name** [String] Name (id) of the tool triggered from within the container`matplotlib.backend_bases.get_registered_canvas_class(format)`  
Return the registered default canvas for given file format. Handles deferred import of required backend.`matplotlib.backend_bases.key_press_handler(event, canvas, toolbar=None)`  
Implement the default mpl key bindings for the canvas and toolbar described at [Navigation Keyboard Shortcuts](#)**Parameters****event** [*KeyEvent*] a key press/release event**canvas** [*FigureCanvasBase*] the backend-specific canvas instance**toolbar** [*NavigationToolbar2*] the navigation cursor toolbar`matplotlib.backend_bases.register_backend(format, backend, description=None)`  
Register a backend for saving to a given file format.**Parameters****format** [str] File extension**backend** [module string or canvas class] Backend for handling file output**description** [str, optional] Description of the file type. Defaults to an empty string

## 18.9.2 matplotlib.backend\_managers

*ToolManager* Class that makes the bridge between user interaction (key press, toolbar clicks, ..) and the actions in response to the user inputs.

```
class matplotlib.backend_managers.ToolEvent(name, sender, tool, data=None)
    Bases: object
    Event for tool manipulation (add/remove)
```

```
class matplotlib.backend_managers.ToolManager(figure=None)
    Bases: object
```

Helper class that groups all the user interactions for a Figure.

**Attributes****figure:** 'Figure'**keypresslock:** 'widgets.LockDraw' LockDraw object to know if the *canvas* key\_press\_event is locked**messagelock:** 'widgets.LockDraw' LockDraw object to know if the message is available to write

`active_toggle`

Currently toggled tools

`add_tool(name, tool, *args, **kwargs)`

Add *tool* to *ToolManager*

If successful adds a new event `tool_trigger_name` where **name** is the **name** of the tool, this event is fired everytime the tool is triggered.

#### Parameters

**name** [str] Name of the tool, treated as the ID, has to be unique

**tool** [class\_like, i.e. str or type] Reference to find the class of the Tool to added.

#### See also:

`matplotlib.backend_tools.ToolBase` The base class for tools.

#### Notes

args and kwargs get passed directly to the tools constructor.

`canvas`

Canvas managed by FigureManager

`figure`

Figure that holds the canvas

`get_tool(name, warn=True)`

Return the tool object, also accepts the actual tool for convenience

#### Parameters

**name** [str, ToolBase] Name of the tool, or the tool itself

**warn** [bool, optional] If this method should give warnings.

`get_tool_keymap(name)`

Get the keymap associated with the specified tool

#### Parameters

**name** [string] Name of the Tool

#### Returns

**list** [list of keys associated with the Tool]

`message_event(message, sender=None)`

Emit a *ToolManagerMessageEvent*

`remove_tool(name)`

Remove tool from *ToolManager*

#### Parameters

**name** [string] Name of the Tool

`set_figure(figure, update_tools=True)`

Bind the given figure to the tools.

#### Parameters

**figure** [*Figure*]

**update\_tools** [bool] Force tools to update figure

`toolmanager_connect(s, func)`  
Connect event with string *s* to *func*.

#### Parameters

**s** [String] Name of the event

The following events are recognized

- 'tool\_message\_event'
- 'tool\_removed\_event'
- 'tool\_added\_event'

For every tool added a new event is created

- 'tool\_trigger\_TOOLNAME' Where TOOLNAME is the id of the tool.

**func** [function] Function to be called with signature `def func(event)`

`toolmanager_disconnect(cid)`  
Disconnect callback id *cid*

Example usage:

```
cid = toolmanager.toolmanager_connect('tool_trigger_zoom',
                                     on_press)
#...later
toolmanager.toolmanager_disconnect(cid)
```

`tools`

Return the tools controlled by *ToolManager*

`trigger_tool(name, sender=None, canvasevent=None, data=None)`  
Trigger a tool and emit the `tool_trigger_[name]` event

#### Parameters

**name** [string] Name of the tool

**sender: object** Object that wishes to trigger the tool

**canvasevent** [Event] Original Canvas event or None

**data** [Object] Extra data to pass to the tool when triggering

`update_keymap(name, *keys)`  
Set the keymap to associate with the specified tool

#### Parameters

**name** [string] Name of the Tool

**keys** [keys to associate with the Tool]

`class matplotlib.backend_managers.ToolManagerMessageEvent(name, sender, message)`  
Bases: `object`

Event carrying messages from toolmanager

Messages usually get displayed to the user by the toolbar

```
class matplotlib.backend_managers.ToolTriggerEvent(name, sender, tool, canvasevent=None, data=None)
```

Bases: `matplotlib.backend_managers.ToolEvent`

Event to inform that a tool has been triggered

### 18.9.3 `matplotlib.backends.backend_mixed`

```
class matplotlib.backends.backend_mixed.MixedModeRenderer(figure, width, height, dpi, vector_renderer, raster_renderer_class=None, bbox_inches_restore=None)
```

Bases: `object`

A helper class to implement a renderer that switches between vector and raster drawing. An example may be a PDF writer, where most things are drawn with PDF vector commands, but some very complex objects, such as quad meshes, are rasterised and then output as images.

#### Parameters

**figure** [`matplotlib.figure.Figure`] The figure instance.

**width** [scalar] The width of the canvas in logical units

**height** [scalar] The height of the canvas in logical units

**dpi** [scalar] The dpi of the canvas

**vector\_renderer** [`matplotlib.backend_bases.RendererBase`] An instance of a subclass of `RendererBase` that will be used for the vector drawing.

**raster\_renderer\_class** [`matplotlib.backend_bases.RendererBase`] The renderer class to use for the raster drawing. If not provided, this will use the Agg backend (which is currently the only viable option anyway.)

`start_rasterizing()`

Enter "raster" mode. All subsequent drawing commands (until `stop_rasterizing` is called) will be drawn with the raster backend.

If `start_rasterizing` is called multiple times before `stop_rasterizing` is called, this method has no effect.

`stop_rasterizing()`

Exit "raster" mode. All of the drawing that was done since the last `start_rasterizing` command will be copied to the vector backend by calling `draw_image`.

If `stop_rasterizing` is called multiple times before `start_rasterizing` is called, this method has no effect.

### 18.9.4 `matplotlib.backend_tools`

Abstract base classes define the primitives for Tools. These tools are used by `matplotlib.backend_managers.ToolManager`

`ToolBase` Simple stateless tool

`ToolToggleBase` Tool that has two states, only one Toggle tool can be active at any given time for the same `matplotlib.backend_managers.ToolManager`

```
class matplotlib.backend_tools.AxisScaleBase(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolToggleBase
    Base Tool to toggle between linear and logarithmic
    disable(event)
        Disable the toggle tool
        trigger call this method when toggled is True.
        This can happen in different circumstances
        • Click on the toolbar tool button
        • Call to matplotlib.backend_managers.ToolManager.trigger_tool
        • Another ToolToggleBase derived tool is triggered (from the same ToolManager)
    enable(event)
        Enable the toggle tool
        trigger calls this method when toggled is False
    trigger(sender, event, data=None)
        Calls enable or disable based on toggled value

class matplotlib.backend_tools.ConfigureSubplotsBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Base tool for the configuration of subplots
    description = 'Configure subplots'
    image = 'subplots'

class matplotlib.backend_tools.Cursors
    Bases: object
    Simple namespace for cursor reference
    HAND = 0
    MOVE = 3
    POINTER = 1
    SELECT_REGION = 2
    WAIT = 4

class matplotlib.backend_tools.RubberbandBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Draw and remove rubberband
    draw_rubberband(*data)
        Draw rubberband
        This method must get implemented per backend
    remove_rubberband()
        Remove rubberband
        This method should get implemented per backend
    trigger(sender, event, data)
        Call draw_rubberband or remove_rubberband based on data
```

```
class matplotlib.backend_tools.SaveFigureBase(toolmanager, name)
```

Bases: `matplotlib.backend_tools.ToolBase`

Base tool for figure saving

`default_keymap = ['s', 'ctrl+s']`

`description = 'Save the figure'`

`image = 'filesave'`

```
class matplotlib.backend_tools.SetCursorBase(*args, **kwargs)
```

Bases: `matplotlib.backend_tools.ToolBase`

Change to the current cursor while in axes

This tool, keeps track of all `ToolToggleBase` derived tools, and calls `set_cursor` when a tool gets triggered

`set_cursor(cursor)`

Set the cursor

This method has to be implemented per backend

`set_figure(figure)`

Assign a figure to the tool

### Parameters

**figure: 'Figure'**

```
class matplotlib.backend_tools.ToolBack(toolmanager, name)
```

Bases: `matplotlib.backend_tools.ViewsPositionsBase`

Move back up the view lim stack

`default_keymap = ['left', 'c', 'backspace']`

`description = 'Back to previous view'`

`image = 'back'`

```
class matplotlib.backend_tools.ToolBase(toolmanager, name)
```

Bases: `object`

Base tool class

A base tool, only implements `trigger` method or not method at all. The tool is instantiated by `matplotlib.backend_managers.ToolManager`

### Attributes

**toolmanager: 'matplotlib.backend\_managers.ToolManager'**

ToolManager that controls this Tool

**figure: 'FigureCanvas'** Figure instance that is affected by this Tool

**name: String** Used as **Id** of the tool, has to be unique among tools of the same ToolManager

`canvas`

`default_keymap = None`

Keymap to associate with this tool

**String:** List of comma separated keys that will be used to call this tool when the keypress event of `self.figure.canvas` is emitted

`description = None`  
Description of the Tool

**String:** If the Tool is included in the Toolbar this text is used as a Tooltip

`destroy()`  
Destroy the tool

This method is called when the tool is removed by `matplotlib.backend_managers.ToolManager.remove_tool`

`figure`

`image = None`  
Filename of the image

**String:** Filename of the image to use in the toolbar. If None, the `name` is used as a label in the toolbar button

`name`  
Tool Id

`set_figure(figure)`  
Assign a figure to the tool

#### Parameters

**figure: 'Figure'**

`toolmanager`

`trigger(sender, event, data=None)`  
Called when this tool gets used

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`

#### Parameters

**event: 'Event'** The Canvas event that caused this tool to be called

**sender: object** Object that requested the tool to be triggered

**data: object** Extra data

`class matplotlib.backend_tools.ToolCopyToClipboardBase(toolmanager, name)`

Bases: `matplotlib.backend_tools.ToolBase`

Tool to copy the figure to the clipboard

`default_keymap = ['ctrl+c', 'cmd+c']`

`description = 'Copy the canvas figure to clipboard'`

`trigger(*args, **kwargs)`  
Called when this tool gets used

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`

#### Parameters

**event: 'Event'** The Canvas event that caused this tool to be called

**sender: object** Object that requested the tool to be triggered

**data: object** Extra data

```
class matplotlib.backend_tools.ToolCursorPosition(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolBase

    Send message with the current pointer position

    This tool runs in the background reporting the position of the cursor

    send_message(event)
        Call matplotlib.backend_managers.ToolManager.message_event

    set_figure(figure)
        Assign a figure to the tool
```

### Parameters

**figure: 'Figure'**

```
class matplotlib.backend_tools.ToolEnableAllNavigation(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase

    Tool to enable all axes for toolmanager interaction

    default_keymap = ['a']

    description = 'Enable all axes toolmanager'

    trigger(sender, event, data=None)
        Called when this tool gets used

        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool
```

### Parameters

**event: 'Event'** The Canvas event that caused this tool to be called  
**sender: object** Object that requested the tool to be triggered  
**data: object** Extra data

```
class matplotlib.backend_tools.ToolEnableNavigation(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase

    Tool to enable a specific axes for toolmanager interaction

    default_keymap = (1, 2, 3, 4, 5, 6, 7, 8, 9)

    description = 'Enable one axes toolmanager'

    trigger(sender, event, data=None)
        Called when this tool gets used

        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool
```

### Parameters

**event: 'Event'** The Canvas event that caused this tool to be called  
**sender: object** Object that requested the tool to be triggered  
**data: object** Extra data

```
class matplotlib.backend_tools.ToolForward(toolmanager, name)
    Bases: matplotlib.backend_tools.ViewsPositionsBase

    Move forward in the view lim stack

    default_keymap = ['right', 'v']

    description = 'Forward to next view'
```

```
image = 'forward'
```

```
class matplotlib.backend_tools.ToolFullScreen(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolToggleBase
    Tool to toggle full screen
    default_keymap = ['f', 'ctrl+f']
    description = 'Toggle fullscreen mode'
    disable(event)
        Disable the toggle tool
        trigger call this method when toggled is True.
        This can happen in different circumstances
        

- Click on the toolbar tool button
- Call to matplotlib.backend_managers.ToolManager.trigger_tool
- Another ToolToggleBase derived tool is triggered (from the same ToolManager)

    enable(event)
        Enable the toggle tool
        trigger calls this method when toggled is False
```

```
class matplotlib.backend_tools.ToolGrid(toolmanager, name)
    Bases: matplotlib.backend_tools._ToolGridBase
    Tool to toggle the major grids of the figure
    default_keymap = ['g']
    description = 'Toggle major grids'
```

```
class matplotlib.backend_tools.ToolHelpBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    default_keymap = ['f1']
    description = 'Print tool list, shortcuts and description'
    static format_shortcut(key_sequence)
        Converts a shortcut string from the notation used in rc config to the standard nota-
        tion for displaying shortcuts, e.g. 'ctrl+a' -> 'Ctrl+A'.
    image = 'help.png'
```

```
class matplotlib.backend_tools.ToolHome(toolmanager, name)
    Bases: matplotlib.backend_tools.ViewsPositionsBase
    Restore the original view lim
    default_keymap = ['h', 'r', 'home']
    description = 'Reset original view'
    image = 'home'
```

```
class matplotlib.backend_tools.ToolMinorGrid(toolmanager, name)
    Bases: matplotlib.backend_tools._ToolGridBase
    Tool to toggle the major and minor grids of the figure
    default_keymap = ['G']
```

```

    description = 'Toggle major and minor grids'
class matplotlib.backend_tools.ToolPan(*args)
    Bases: matplotlib.backend_tools.ZoomPanBase
    Pan axes with left mouse, zoom with right
    cursor = 3
    default_keymap = ['p']
    description = 'Pan axes with left mouse, zoom with right'
    image = 'move'
    radio_group = 'default'
class matplotlib.backend_tools.ToolQuit(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Tool to call the figure manager destroy method
    default_keymap = ['ctrl+w', 'cmd+w', 'q']
    description = 'Quit the figure'
    trigger(sender, event, data=None)
        Called when this tool gets used
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool

```

**Parameters**

**event: 'Event'** The Canvas event that caused this tool to be called

**sender: object** Object that requested the tool to be triggered

**data: object** Extra data

```

class matplotlib.backend_tools.ToolQuitAll(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Tool to call the figure manager destroy method
    default_keymap = ['W', 'cmd+W', 'Q']
    description = 'Quit all figures'
    trigger(sender, event, data=None)
        Called when this tool gets used
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool

```

**Parameters**

**event: 'Event'** The Canvas event that caused this tool to be called

**sender: object** Object that requested the tool to be triggered

**data: object** Extra data

```

class matplotlib.backend_tools.ToolToggleBase(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolBase
    Toggleable tool
    Every time it is triggered, it switches between enable and disable

```

**Parameters**

**\*\*args** Variable length argument to be used by the Tool

**\*\*kwargs** *toggled* if present and True, sets the initial state of the Tool  
Arbitrary keyword arguments to be consumed by the Tool

`cursor = None`

Cursor to use when the tool is active

`default_toggled = False`

Default of toggled state

`disable(event=None)`

Disable the toggle tool

*trigger* call this method when *toggled* is True.

This can happen in different circumstances

- Click on the toolbar tool button
- Call to `matplotlib.backend_managers.ToolManager.trigger_tool`
- Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`)

`enable(event=None)`

Enable the toggle tool

*trigger* calls this method when *toggled* is False

`radio_group = None`

Attribute to group 'radio' like tools (mutually exclusive)

**String** that identifies the group or **None** if not belonging to a group

`set_figure(figure)`

Assign a figure to the tool

### Parameters

**figure: 'Figure'**

`toggled`

State of the toggled tool

`trigger(sender, event, data=None)`

Calls *enable* or *disable* based on *toggled* value

`class matplotlib.backend_tools.ToolViewsPositions(*args, **kwargs)`

Bases: `matplotlib.backend_tools.ToolBase`

Auxiliary Tool to handle changes in views and positions

Runs in the background and should get used by all the tools that need to access the figure's history of views and positions, e.g.

- `ToolZoom`
- `ToolPan`
- `ToolHome`
- `ToolBack`
- `ToolForward`

`add_figure(figure)`

Add the current figure to the stack of views and positions

```

back()
    Back one step in the stack of views and positions
clear(figure)
    Reset the axes stack
forward()
    Forward one step in the stack of views and positions
home()
    Recall the first view and position from the stack
push_current(figure=None)
    Push the current view limits and position onto their respective stacks
refresh_locators()
    Redraw the canvases, update the locators
update_home_views(figure=None)
    Make sure that self.home_views has an entry for all axes present in the figure
update_view()
    Update the view limits and position for each axes from the current stack position. If
    any axes are present in the figure that aren't in the current stack position, use the
    home view limits for those axes and don't update any positions.
class matplotlib.backend_tools.ToolXScale(*args, **kwargs)
    Bases: matplotlib.backend_tools.AxisScaleBase
    Tool to toggle between linear and logarithmic scales on the X axis
    default_keymap = ['k', 'L']
    description = 'Toggle scale X axis'
    set_scale(ax, scale)
class matplotlib.backend_tools.ToolYScale(*args, **kwargs)
    Bases: matplotlib.backend_tools.AxisScaleBase
    Tool to toggle between linear and logarithmic scales on the Y axis
    default_keymap = ['1']
    description = 'Toggle scale Y axis'
    set_scale(ax, scale)
class matplotlib.backend_tools.ToolZoom(*args)
    Bases: matplotlib.backend_tools.ZoomPanBase
    Zoom to rectangle
    cursor = 2
    default_keymap = ['o']
    description = 'Zoom to rectangle'
    image = 'zoom_to_rect'
    radio_group = 'default'
class matplotlib.backend_tools.ViewsPositionsBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Base class for ToolHome, ToolBack and ToolForward

```

`trigger(sender, event, data=None)`  
Called when this tool gets used

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`

### Parameters

**event: 'Event'** The Canvas event that caused this tool to be called

**sender: object** Object that requested the tool to be triggered

**data: object** Extra data

`class matplotlib.backend_tools.ZoomPanBase(*args)`  
Bases: `matplotlib.backend_tools.ToolToggleBase`

Base class for `ToolZoom` and `ToolPan`

`disable(event)`  
Release the canvas and disconnect press/release events

`enable(event)`  
Connect press/release events and lock the canvas

`scroll_zoom(event)`

`trigger(sender, event, data=None)`  
Calls `enable` or `disable` based on toggled value

`matplotlib.backend_tools.add_tools_to_container(container, tools=[['navigation',  
['home', 'back', 'forward']], ['zoom-  
pan', ['pan', 'zoom', 'subplots']], ['io',  
['save', 'help']]])`

Add multiple tools to the container.

### Parameters

**container: Container** `backend_bases.ToolContainerBase` object that will get the tools added

**tools** [list, optional] List in the form `[[group1, [tool1, tool2 ...]], [group2, [...]]]` Where the tools given by `tool1`, and `tool2` will display in `group1`. See `add_tool` for details.

```
matplotlib.backend_tools.add_tools_to_manager(toolmanager, tools={'allnav': <class
    'matplotlib.backend_tools.ToolEnableAllNavigation'>,
    'back': <class 'matplotlib.backend_tools.ToolBack'>,
    'copy': 'ToolCopyToClipboard', 'cursor':
    'ToolSetCursor', 'forward': <class 'matplotlib.backend_tools.ToolForward'>,
    'fullscreen': <class 'matplotlib.backend_tools.ToolFullScreen'>,
    'grid': <class 'matplotlib.backend_tools.ToolGrid'>,
    'grid_minor': <class 'matplotlib.backend_tools.ToolMinorGrid'>,
    'help': 'ToolHelp', 'home': <class 'matplotlib.backend_tools.ToolHome'>,
    'nav': <class 'matplotlib.backend_tools.ToolEnableNavigation'>,
    'pan': <class 'matplotlib.backend_tools.ToolPan'>,
    'position': <class 'matplotlib.backend_tools.ToolCursorPosition'>,
    'quit': <class 'matplotlib.backend_tools.ToolQuit'>,
    'quit_all': <class 'matplotlib.backend_tools.ToolQuitAll'>,
    'rubberband': 'ToolRubberband', 'save':
    'ToolSaveFigure', 'subplots': 'ToolCon-
    figureSubplots', 'viewpos': <class 'mat-
    plotlib.backend_tools.ToolViewsPositions'>,
    'xscale': <class 'mat-
    plotlib.backend_tools.ToolXScale'>,
    'yscale': <class 'mat-
    plotlib.backend_tools.ToolYScale'>,
    'zoom': <class 'mat-
    plotlib.backend_tools.ToolZoom'>})
```

Add multiple tools to ToolManager

### Parameters

**toolmanager: ToolManager** backend\_managers.ToolManager object that will get the tools added

**tools** [{str: class\_like}, optional] The tools to add in a {name: tool} dict, see add\_tool for more info.

```
matplotlib.backend_tools.default_toolbar_tools = [['navigation', ['home', 'back', 'forward']], ['zoompan']]
Default tools in the toolbar
```

```
matplotlib.backend_tools.default_tools = {'allnav': <class 'matplotlib.backend_tools.ToolEnableAllNavigation'>,
    'back': <class 'matplotlib.backend_tools.ToolBack'>,
    'copy': 'ToolCopyToClipboard', 'cursor':
    'ToolSetCursor', 'forward': <class 'matplotlib.backend_tools.ToolForward'>,
    'fullscreen': <class 'matplotlib.backend_tools.ToolFullScreen'>,
    'grid': <class 'matplotlib.backend_tools.ToolGrid'>,
    'grid_minor': <class 'matplotlib.backend_tools.ToolMinorGrid'>,
    'help': 'ToolHelp', 'home': <class 'matplotlib.backend_tools.ToolHome'>,
    'nav': <class 'matplotlib.backend_tools.ToolEnableNavigation'>,
    'pan': <class 'matplotlib.backend_tools.ToolPan'>,
    'position': <class 'matplotlib.backend_tools.ToolCursorPosition'>,
    'quit': <class 'matplotlib.backend_tools.ToolQuit'>,
    'quit_all': <class 'matplotlib.backend_tools.ToolQuitAll'>,
    'rubberband': 'ToolRubberband', 'save':
    'ToolSaveFigure', 'subplots': 'ToolCon-
    figureSubplots', 'viewpos': <class 'mat-
    plotlib.backend_tools.ToolViewsPositions'>,
    'xscale': <class 'mat-
    plotlib.backend_tools.ToolXScale'>,
    'yscale': <class 'mat-
    plotlib.backend_tools.ToolYScale'>,
    'zoom': <class 'mat-
    plotlib.backend_tools.ToolZoom'>})
Default tools
```

## 18.9.5 matplotlib.backends.backend\_agg

An agg <http://antigrain.com/> backend

Features that are implemented

- capstyles and join styles
- dashes
- linewidth
- lines, rectangles, ellipses
- clipping to a rectangle
- output to RGBA and PNG, optionally JPEG and TIFF
- alpha blending
- DPI scaling properly - everything scales properly (dashes, linewidths, etc)
- draw polygon
- freetype2 w/ ft2font

TODO:

- integrate screen dpi w/ ppi and text

`matplotlib.backends.backend_agg.FigureCanvas`  
alias of `matplotlib.backends.backend_agg.FigureCanvasAgg`

`class matplotlib.backends.backend_agg.FigureCanvasAgg(figure)`  
Bases: `matplotlib.backend_bases.FigureCanvasBase`

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc...

### Attributes

**figure** [`matplotlib.figure.Figure`] A high-level Figure instance

`buffer_rgba()`

Get the image as an RGBA byte string.

*draw* must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

### Returns

**bytes**

`copy_from_bbox(bbox)`

`draw()`

Draw the figure using the renderer.

`get_renderer(cleared=False)`

`print_jpeg(filename_or_obj, *args, dryrun=False, **kwargs)`

Write the figure to a JPEG file.

### Parameters

**filename\_or\_obj** [str or PathLike or file-like object] The file to write to.

### Other Parameters

**quality** [int] The image quality, on a scale from 1 (worst) to 100 (best). The default is `rcParams["savefig.jpeg_quality"]`. Values above 95 should be avoided; 100 completely disables the JPEG quantization stage.

**optimize** [bool] If present, indicates that the encoder should make an extra pass over the image in order to select optimal encoder settings.

**progressive** [bool] If present, indicates that this image should be stored as a progressive JPEG file.

```
print_jpg(filename_or_obj, *args, dryrun=False, **kwargs)
```

Write the figure to a JPEG file.

#### Parameters

**filename\_or\_obj** [str or PathLike or file-like object] The file to write to.

#### Other Parameters

**quality** [int] The image quality, on a scale from 1 (worst) to 100 (best). The default is `rcParams["savefig.jpeg_quality"]`. Values above 95 should be avoided; 100 completely disables the JPEG quantization stage.

**optimize** [bool] If present, indicates that the encoder should make an extra pass over the image in order to select optimal encoder settings.

**progressive** [bool] If present, indicates that this image should be stored as a progressive JPEG file.

```
print_png(filename_or_obj, *args, **kwargs)
```

Write the figure to a PNG file.

#### Parameters

**filename\_or\_obj** [str or PathLike or file-like object] The file to write to.

**metadata** [dict, optional] Metadata in the PNG file as key-value pairs of bytes or latin-1 encodable strings. According to the PNG specification, keys must be shorter than 79 chars.

The [PNG specification](#) defines some common keywords that may be used as appropriate:

- Title: Short (one line) title or caption for image.
- Author: Name of image's creator.
- Description: Description of image (possibly long).
- Copyright: Copyright notice.
- Creation Time: Time of original image creation (usually RFC 1123 format).
- Software: Software used to create the image.
- Disclaimer: Legal disclaimer.
- Warning: Warning of nature of content.
- Source: Device used to create the image.
- Comment: Miscellaneous comment; conversion from other image format.

Other keywords may be invented for other purposes.

If 'Software' is not given, an autogenerated value for matplotlib will be used.

For more details see the [PNG specification](#).

```
print_raw(filename_or_obj, *args, **kwargs)
print_rgba(filename_or_obj, *args, **kwargs)
print_tif(filename_or_obj, *args, dryrun=False, **kwargs)
print_tiff(filename_or_obj, *args, dryrun=False, **kwargs)
print_to_buffer()
restore_region(region, bbox=None, xy=None)
```

```
tostring_argb()
```

Get the image as an ARGB byte string

*draw* must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

### Returns

**bytes**

```
tostring_rgb()
```

Get the image as an RGB byte string.

*draw* must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

### Returns

**bytes**

```
class matplotlib.backends.backend_agg.RendererAgg(width, height, dpi)
```

Bases: [matplotlib.backend\\_bases.RendererBase](#)

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles

```
buffer_rgba()
```

```
clear()
```

```
draw_mathtext(gc, x, y, s, prop, angle)
```

Draw the math text using `matplotlib.mathtext`

```
draw_path(gc, path, transform, rgbFace=None)
```

Draw the path

```
draw_tex(gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)
```

```
draw_text(gc, x, y, s, prop, angle, ismath=False, mtext=None)
```

Render the text

```
get_canvas_width_height()
```

return the canvas width and height in display coords

```
get_text_width_height_descent(s, prop, ismath)
```

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with [FontProperties](#) *prop*

```
lock = <unlocked _thread.RLock object owner=0 count=0>
```

```
option_image_nocomposite()
```

override this method for renderers that do not necessarily always want to rescale and composite raster images. (like SVG, PDF, or PS)

`option_scale_image()`  
agg backend doesn't support arbitrary scaling of image.

`points_to_pixels(points)`  
convert point measures to pixes using dpi and the pixels per inch of the display

`restore_region(region, bbox=None, xy=None)`  
Restore the saved region. If `bbox` (instance of `BboxBase`, or its extents) is given, only the region specified by the `bbox` will be restored. `xy` (a tuple of two floats) optionally specifies the new position (the LLC of the original region, not the LLC of the `bbox`) where the region will be restored.

```
>>> region = renderer.copy_from_bbox()
>>> x1, y1, x2, y2 = region.get_extents()
>>> renderer.restore_region(region, bbox=(x1+dx, y1, x2, y2),
...                               xy=(x1-dx, y1))
```

`start_filter()`  
Start filtering. It simply create a new canvas (the old one is saved).

`stop_filter(post_processing)`  
Save the plot in the current canvas as a image and apply the `post_processing` function.

```
def post_processing(image, dpi): # ny, nx, depth = image.shape # image
    (numpy array) has RGBA channels and has a depth of 4. ... # create
    a new_image (numpy array of 4 channels, size can be # different). The
    resulting image may have offsets from # lower-left corner of the original
    image return new_image, offset_x, offset_y
```

The saved renderer is restored and the returned image from `post_processing` is plotted (using `draw_image`) on it.

`tostring_argb()`

`tostring_rgb()`

`tostring_rgba_minimized()`

`matplotlib.backends.backend_agg.get_hinting_flag()`

## 18.9.6 matplotlib.backends.backend\_cairo

### A Cairo backend for matplotlib

**Author** Steve Chaplin and others

This backend depends on `cairocffi` or `pycairo`.

```
class matplotlib.backends.backend_cairo.ArrayWrapper(**kwargs)
    Bases: object
```

Deprecated since version 3.0: The `ArrayWrapper` class was deprecated in Matplotlib 3.0 and will be removed in 3.2.

**Thin wrapper around numpy ndarray to expose the interface** expected by `cairocffi`. Basically replicates the `array.array` interface.

`buffer_info()`

```
matplotlib.backends.backend_cairo.FigureCanvas
    alias of matplotlib.backends.backend_cairo.FigureCanvasCairo
class matplotlib.backends.backend_cairo.FigureCanvasCairo(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase
    print_pdf(fobj, *args, **kwargs)
    print_png(fobj, *args, **kwargs)
    print_ps(fobj, *args, **kwargs)
    print_raw(fobj, *args, **kwargs)
    print_rgba(fobj, *args, **kwargs)
    print_svg(fobj, *args, **kwargs)
    print_svgz(fobj, *args, **kwargs)
    supports_blit = False

class matplotlib.backends.backend_cairo.GraphicsContextCairo(renderer)
    Bases: matplotlib.backend_bases.GraphicsContextBase
    get_rgb()
        returns a tuple of three or four floats from 0-1.
    restore()
        Restore the graphics context from the stack - needed only for backends that save
        graphics contexts on a stack
    set_alpha(alpha)
        Set the alpha value used for blending - not supported on all backends. If alpha=None
        (the default), the alpha components of the foreground and fill colors will be used to
        set their respective transparencies (where applicable); otherwise, alpha will override
        them.
    set_capstyle(cs)
        Set the capstyle as a string in ('butt', 'round', 'projecting')
    set_clip_path(path)
        Set the clip path and transformation. Path should be a TransformedPath instance.
    set_clip_rectangle(rectangle)
        Set the clip rectangle with sequence (left, bottom, width, height)
    set_dashes(offset, dashes)
        Set the dash style for the gc.

Parameters
    dash_offset [float] is the offset (usually 0).
    dash_list [array_like] specifies the on-off sequence as points. (None,
        None) specifies a solid line
    set_foreground(fg, isRGBA=None)
        Set the foreground color. fg can be a MATLAB format string, a html hex color string,
        an rgb or rgba unit tuple, or a float between 0 and 1. In the latter case, grayscale is
        used.
        If you know fg is rgba, set isRGBA=True for efficiency.
```

`set_joinstyle(js)`  
Set the join style to be one of ('miter', 'round', 'bevel')

`set_linewidth(w)`  
Set the linewidth in points

`class matplotlib.backends.backend_cairo.RendererCairo(dpi)`

Bases: `matplotlib.backend_bases.RendererBase`

`static convert_path(ctx, path, transform, clip=None)`  
Deprecated since version 3.0: The `convert_path` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

`draw_image(gc, x, y, im)`  
Draw an RGBA image.

### Parameters

- gc** [`GraphicsContextBase`] a graphics context with clipping information.
- x** [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- y** [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- im** [array\_like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- transform** [`matplotlib.transforms.Affine2DBase`] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation *may* be passed to `draw_image()`. It takes the form of a `Affine2DBase` instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override `x` and `y`, and has to be applied *before* translating the result by `x` and `y` (this can be accomplished by adding `x` and `y` to the translation vector defined by `transform`).

`draw_markers(gc, marker_path, marker_trans, path, transform, rgbFace=None)`  
Draws a marker at each of the vertices in `path`. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

- gc** [`GraphicsContextBase`] The graphics context
- marker\_trans** [`matplotlib.transforms.Transform`] An affine transform applied to the marker.
- trans** [`matplotlib.transforms.Transform`] An affine transform applied to the path.

`draw_path(gc, path, transform, rgbFace=None)`  
Draws a `Path` instance using the given affine transform.

`draw_path_collection(gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyle, antialiaseds, urls, offset_position)`

Draws a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied. *offset\_position* may be either "screen" or "data" depending on the space that the offsets are in.

This provides a fallback implementation of *draw\_path\_collection()* that makes multiple calls to *draw\_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods *\_iter\_collection\_raw\_paths()* and *\_iter\_collection()* are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw\_path\_collection()* can be made globally.

`draw_text(gc, x, y, s, prop, angle, ismath=False, mtext=None)`  
Draw the text instance

### Parameters

**gc** [GraphicsContextBase] the graphics context  
**x** [scalar] the x location of the text in display coords  
**y** [scalar] the y location of the text baseline in display coords  
**s** [str] the text string  
**prop** [*matplotlib.font\_manager.FontProperties*] font properties  
**angle** [scalar] the rotation angle in degrees  
**mtext** [*matplotlib.text.Text*] the original text object to be rendered

### Notes

#### backend implementers note

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

```
fontangles = {'italic': <MyCairoCffi name='mock.FONT_SLANT_ITALIC' id='140354934147336'>, 'normal'  
fontweights = {100: <MyCairoCffi name='mock.FONT_WEIGHT_NORMAL' id='140354934118216'>, 200: <MyCai  
get_canvas_width_height()  
    return the canvas width and height in display coords  
get_text_width_height_descent(s, prop, ismath)  
    Get the width, height, and descent (offset from the bottom to the baseline), in display  
    coords, of the string s with FontProperties prop  
new_gc()  
    Return an instance of a GraphicsContextBase
```

`points_to_pixels(points)`

Convert points to display units

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72.0 * dpi/72.0
```

### Parameters

**points** [scalar or array\_like] a float or a numpy array of float

### Returns

**Points converted to pixels**

`set_ctx_from_surface(surface)`

`set_width_height(width, height)`

## 18.9.7 matplotlib.backends.backend\_gtk3agg

**TODO** We'll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

## 18.9.8 matplotlib.backends.backend\_gtk3cairo

**TODO** We'll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

## 18.9.9 matplotlib.backends.backend\_nbagg

Interactive figures in the IPython notebook

```
class matplotlib.backends.backend_nbagg.CommSocket(manager)
```

Bases: `object`

Manages the Comm connection between IPython and the browser (client).

Comms are 2 way, with the CommSocket being able to publish a message via the `send_json` method, and handle a message with `on_message`. On the JS side `figure.send_message` and `figure.ws.onmessage` do the sending and receiving respectively.

```
is_open()
```

```
on_close()
```

```
on_message(message)
```

```
send_binary(blob)
```

```
send_json(content)
```

```
matplotlib.backends.backend_nbagg.FigureCanvas
```

alias of `matplotlib.backends.backend_nbagg.FigureCanvasNbAgg`

```
class matplotlib.backends.backend_nbagg.FigureCanvasNbAgg(*args, **kwargs)
    Bases: matplotlib.backends.backend_webagg_core.FigureCanvasWebAggCore
```

```
new_timer(*args, **kwargs)
```

Creates a new backend-specific subclass of `backend_bases.Timer`. This is useful for getting periodic events through the backend's native event loop. Implemented only for backends with GUIs.

### Other Parameters

**interval** [scalar] Timer interval in milliseconds

**callbacks** [List[Tuple[callable, Tuple, Dict]]] Sequence of (func, args, kwargs) where `func(*args, **kwargs)` will be executed by the timer every *interval*.

callbacks which return `False` or `0` will be removed from the timer.

### Examples

```
>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1, ), {'a': 3}),])
```

```
matplotlib.backends.backend_nbagg.FigureManager
```

alias of `matplotlib.backends.backend_nbagg.FigureManagerNbAgg`

```
class matplotlib.backends.backend_nbagg.FigureManagerNbAgg(canvas, num)
```

Bases: `matplotlib.backends.backend_webagg_core.FigureManagerWebAgg`

```
ToolbarCls
```

alias of `NavigationIPy`

```
cleanup_closed()
```

Clear up any closed Comms.

```
connected
```

```
destroy()
```

```
display_js()
```

```
classmethod get_javascript(stream=None)
```

```
remove_comm(comm_id)
```

```
reshow()
```

A special method to re-show the figure in the notebook.

```
show()
```

For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception to be caught by `show()`, for an optional warning.

```
class matplotlib.backends.backend_nbagg.NavigationIPy(canvas)
```

Bases: `matplotlib.backends.backend_webagg_core.NavigationToolbar2WebAgg`

```
toolitems = [('Home', 'Reset original view', 'fa fa-home icon-home', 'home'), ('Back', 'Back to pre
```

```
matplotlib.backends.backend_nbagg.connection_info()
```

Return a string showing the figure and connection status for the backend. This is intended as a diagnostic tool, and not for general use.

```
matplotlib.backends.backend_nbagg.new_figure_manager_given_figure(num, figure)
```

Create a new figure manager instance for the given figure.

`matplotlib.backends.backend_nbagg.show(*args, **kwargs)`  
 Show all figures.

`show` blocks by calling `mainloop` if `block` is `True`, or if it is `None` and we are neither in IPython's `%pylab` mode, nor in interactive mode.

### 18.9.10 `matplotlib.backends.backend_pdf`

A PDF matplotlib backend Author: Jouni K Seppänen <[jks@iki.fi](mailto:jks@iki.fi)>

`matplotlib.backends.backend_pdf.FigureCanvas`  
 alias of `matplotlib.backends.backend_pdf.FigureCanvasPdf`

`class matplotlib.backends.backend_pdf.FigureCanvasPdf(figure)`  
 Bases: `matplotlib.backends.backend_bases.FigureCanvasBase`

The canvas the figure renders into. Calls the `draw` and `print` `fig` methods, creates the renderers, etc...

#### Attributes

**figure** [`matplotlib.figure.Figure`] A high-level Figure instance

`draw()`

Render the *Figure*.

`filetypes = {'pdf': 'Portable Document Format'}`

`fixed_dpi = 72`

`get_default_filetype()`

Get the default savefig file format as specified in `rcParam savefig.format`. Returned string excludes period. Overridden in backends that only support a single file type.

`print_pdf(filename, *, dpi=72, bbox_inches_restore=None, metadata=None, **kwargs)`

`class matplotlib.backends.backend_pdf.GraphicsContextPdf(file)`  
 Bases: `matplotlib.backends.backend_bases.GraphicsContextBase`

`alpha_cmd(alpha, forced, effective_alphas)`

`capstyle_cmd(style)`

`capstyles = {'butt': 0, 'projecting': 2, 'round': 1}`

`clip_cmd(cliprect, clippath)`

Set clip rectangle. Calls `self.pop()` and `self.push()`.

`commands = (('cliprect', '_clippath'), <function GraphicsContextPdf.clip_cmd>), (('alpha', '_for`

`copy_properties(other)`

Copy properties of *other* into self.

`dash_cmd(dashes)`

`delta(other)`

Copy properties of *other* into self and return PDF commands needed to transform self into *other*.

`fill(*args)`

Predicate: does the path need to be filled?

An optional argument can be used to specify an alternative `_fillcolor`, as needed by `RendererPdf.draw_markers`.

`fillcolor_cmd(rgb)`

`finalize()`

Make sure every pushed graphics state is popped.

`hatch_cmd(hatch, hatch_color)`

`joinstyle_cmd(style)`

`joinstyles = {'bevel': 2, 'miter': 0, 'round': 1}`

`linewidth_cmd(width)`

`paint()`

Return the appropriate pdf operator to cause the path to be stroked, filled, or both.

`pop()`

`push()`

`rgb_cmd(rgb)`

`stroke()`

Predicate: does the path need to be stroked (its outline drawn)? This tests for the various conditions that disable stroking the path, in which case it would presumably be filled.

```
class matplotlib.backends.backend_pdf.Name(name)
```

```
    Bases: object
```

```
    PDF name object.
```

```
    static hexify(match)
```

```
    name
```

```
    pdfRepr()
```

```
class matplotlib.backends.backend_pdf.Operator(op)
```

```
    Bases: object
```

```
    PDF operator object.
```

```
    op
```

```
    pdfRepr()
```

```
class matplotlib.backends.backend_pdf.PdfFile(filename, metadata=None)
```

```
    Bases: object
```

```
    PDF file object.
```

```
    addGouraudTriangles(points, colors)
```

```
    alphaState(alpha)
```

```
        Return name of an ExtGState that sets alpha to the given value.
```

```
    beginStream(id, len, extra=None, png=None)
```

```
    close()
```

```
        Flush all buffers and free all resources.
```

```
    createType1Descriptor(t1font, fontfile)
```

`dviFontName(dvifont)`  
 Given a dvi font object, return a name suitable for `Op.selectfont`. This registers the font information in `self.dviFontInfo` if not yet registered.

`embedTTF(filename, characters)`  
 Embed the TTF font from the named file into the document.

`endStream()`

`finalize()`  
 Write out the various deferred objects and the pdf end matter.

`fontName(fontprop)`  
 Select a font based on `fontprop` and return a name suitable for `Op.selectfont`. If `fontprop` is a string, it will be interpreted as the filename of the font.

`hatchPattern(hatch_style)`

`imageObject(image)`  
 Return name of an image XObject representing the given image.

`markerObject(path, trans, fill, stroke, lw, joinstyle, capstyle)`  
 Return name of a marker XObject representing the given path.

`newPage(width, height)`

`newTextnote(text, positionRect=[-100, -100, 0, 0])`

`output(*data)`

`pathCollectionObject(gc, path, trans, padding, filled, stroked)`

`static pathOperations(path, transform, clip=None, simplify=None, sketch=None)`

`recordXref(id)`

`reserveObject(name="")`  
 Reserve an ID for an indirect object. The name is used for debugging in case we forget to print out the object with `writeObject`.

`texFontMap`  
 Deprecated since version 3.0: The `texFontMap` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

`write(data)`

`writeFonts()`

`writeGouraudTriangles()`

`writeHatches()`

`writeImages()`

`writeInfoDict()`  
 Write out the info dictionary, checking it for good form

`writeMarkers()`

`writeObject(object, contents)`

`writePath(path, transform, clip=False, sketch=None)`

`writePathCollectionTemplates()`

`writeTrailer()`  
 Write out the PDF trailer.

`writeXref()`  
Write out the xref table.

`class matplotlib.backends.backend_pdf.PdfPages(filename, keep_empty=True, meta-  
data=None)`

Bases: `object`

A multi-page PDF file.

## Notes

In reality `PdfPages` is a thin wrapper around `PdfFile`, in order to avoid confusion when using `savefig()` and forgetting the format argument.

## Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new `PdfPages` object.

### Parameters

**filename** [str] Plots using `PdfPages.savefig()` will be written to a file at this location. The file is opened at once and any older file with the same name is overwritten.

**keep\_empty** [bool, optional] If set to `False`, then empty pdf files will be deleted automatically when closed.

**metadata** [dictionary, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.:  
{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome fig'}

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

`attach_note(text, positionRect=[-100, -100, 0, 0])`

Add a new text note to the page to be saved next. The optional `positionRect` specifies the position of the new note on the page. It is outside the page per default to make sure it is invisible on printouts.

`close()`

Finalize this object, making the underlying file a complete PDF file.

`get_pagecount()`

Returns the current number of pages in the multipage pdf file.

`infodict()`

Return a modifiable information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary').

`keep_empty`

`savefig(figure=None, **kwargs)`

Saves a *Figure* to this file as a new page.

Any other keyword arguments are passed to `savefig()`.

### Parameters

**figure** [*Figure* or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a *Figure* instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

`class matplotlib.backends.backend_pdf.Reference(id)`

Bases: `object`

PDF reference object. Use `PdfFile.reserveObject()` to create References.

`pdfRepr()`

`write(contents, file)`

`class matplotlib.backends.backend_pdf.RendererPdf(file, image_dpi, height, width)`

Bases: `matplotlib.backend_bases.RendererBase`

`afm_font_cache = {}`

`check_gc(gc, fillcolor=None)`

`draw_gouraud_triangle(gc, points, colors, trans)`

Draw a Gouraud-shaded triangle.

### Parameters

**points** [array\_like, shape=(3, 2)] Array of (x, y) points for the triangle.

**colors** [array\_like, shape=(3, 4)] RGBA colors for each point of the triangle.

**transform** [`matplotlib.transforms.Transform`] An affine transform to apply to the points.

`draw_gouraud_triangles(gc, points, colors, trans)`

Draws a series of Gouraud triangles.

### Parameters

**points** [array\_like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.

**colors** [array\_like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.

**transform** [`matplotlib.transforms.Transform`] An affine transform to apply to the points.

`draw_image(gc, x, y, im, transform=None)`

Draw an RGBA image.

### Parameters

- gc** [GraphicsContextBase] a graphics context with clipping information.
- x** [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- y** [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- im** [array\_like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option\_scale\_image()* returns True, an affine transformation *may* be passed to *draw\_image()*. It takes the form of a *Affine2DBase* instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_markers(gc, marker_path, marker_trans, path, trans, rgbFace=None)`

Draws a marker at each of the vertices in *path*. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

- gc** [GraphicsContextBase] The graphics context
- marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.
- trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_mathtext(gc, x, y, s, prop, angle)`

`draw_path(gc, path, transform, rgbFace=None)`

Draws a *Path* instance using the given affine transform.

`draw_path_collection(gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyle, antialiaseds, urls, offset_position)`

Draws a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyle* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied. *offset\_position* may be either "screen" or "data" depending on the space that the offsets are in.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

`draw_tex(gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)`

`draw_text(gc, x, y, s, prop, angle, ismath=False, mtext=None)`  
 Draw the text instance

### Parameters

- gc** [`GraphicsContextBase`] the graphics context
- x** [scalar] the x location of the text in display coords
- y** [scalar] the y location of the text baseline in display coords
- s** [str] the text string
- prop** [`matplotlib.font_manager.FontProperties`] font properties
- angle** [scalar] the rotation angle in degrees
- mtext** [`matplotlib.text.Text`] the original text object to be rendered

### Notes

#### backend implementers note

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to `if 1`, and then the actual bounding box will be plotted along with your text.

`encode_string(s, fonttype)`

`finalize()`

`flipy()`

Return true if y small numbers are top for renderer Is used for drawing text (`matplotlib.text`) and images (`matplotlib.image`) only

`get_canvas_width_height()`

return the canvas width and height in display coords

`get_image_magnification()`

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

`get_text_width_height_descent(s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string `s` with `FontProperties prop`

`merge_used_characters(other)`

`new_gc()`

Return an instance of a `GraphicsContextBase`

`option_image_nocomposite()`

return whether to generate a composite image from multiple images on a set of axes

`option_scale_image()`

pdf backend support arbitrary scaling of image.

`track_characters(font, s)`

Keeps track of which characters are required from each font.

`class matplotlib.backends.backend_pdf.Stream(id, len, file, extra=None, png=None)`

Bases: `object`

PDF stream object.

This has no `pdfRepr` method. Instead, call `begin()`, then output the contents of the stream by calling `write()`, and finally call `end()`.

`id`: object id of stream; `len`: an unused Reference object for the length of the stream, or `None` (to use a memory buffer); `file`: a PdfFile; `extra`: a dictionary of extra key-value pairs to include in the stream header; `png`: if the data is already png compressed, the decode parameters

`compressobj`

`end()`

Finalize stream.

`extra`

`file`

`id`

`len`

`pdfFile`

`pos`

`write(data)`

Write some data on the stream.

`class matplotlib.backends.backend_pdf.Verbatim(x)`

Bases: `object`

Store verbatim PDF command content for later inclusion in the stream.

`pdfRepr()`

`matplotlib.backends.backend_pdf.fill(strings, linelen=75)`

Make one string from sequence of strings, with whitespace in between. The whitespace is chosen to form lines of at most `linelen` characters, if possible.

`matplotlib.backends.backend_pdf.pdfRepr(obj)`

Map Python objects to PDF syntax.

### 18.9.11 `matplotlib.backends.backend_pgf`

`matplotlib.backends.backend_pgf.FigureCanvas`

alias of `matplotlib.backends.backend_pgf.FigureCanvasPgf`

`class matplotlib.backends.backend_pgf.FigureCanvasPgf(figure)`

Bases: `matplotlib.backend_bases.FigureCanvasBase`

`filetypes = {'pdf': 'LaTeX compiled PGF picture', 'pgf': 'LaTeX PGF picture', 'png': 'Portable Net`

`get_default_filetype()`

Get the default savefig file format as specified in `rcParam savefig.format`. Returned string excludes period. Overridden in backends that only support a single file type.

```
get_renderer()
```

```
print_pdf(fname_or_fh, *args, **kwargs)
```

Use LaTeX to compile a Pgf generated figure to PDF.

```
print_pgf(fname_or_fh, *args, **kwargs)
```

Output pgf commands for drawing the figure so it can be included and rendered in latex documents.

```
print_png(fname_or_fh, *args, **kwargs)
```

Use LaTeX to compile a pgf figure to pdf and convert it to png.

```
matplotlib.backends.backend_pgf.FigureManager
```

alias of `matplotlib.backends.backend_pgf.FigureManagerPgf`

```
class matplotlib.backends.backend_pgf.FigureManagerPgf(canvas, num)
```

Bases: `matplotlib.backend_bases.FigureManagerBase`

```
class matplotlib.backends.backend_pgf.GraphicsContextPgf
```

Bases: `matplotlib.backend_bases.GraphicsContextBase`

```
exception matplotlib.backends.backend_pgf.LatexError(message, latex_output="")
```

Bases: `Exception`

```
class matplotlib.backends.backend_pgf.LatexManager
```

Bases: `object`

The LatexManager opens an instance of the LaTeX application for determining the metrics of text elements. The LaTeX environment can be modified by setting fonts and/or a custom preamble in the rc parameters.

```
get_width_height_descent(text, prop)
```

Get the width, total height and descent for a text typesetted by the current LaTeX environment.

```
class matplotlib.backends.backend_pgf.LatexManagerFactory
```

Bases: `object`

```
static get_latex_manager()
```

```
previous_instance = None
```

```
class matplotlib.backends.backend_pgf.PdfPages(filename, *, keep_empty=True, meta-  
data=None)
```

Bases: `object`

A multi-page PDF file using the pgf backend

## Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

### Parameters

**filename** [str] Plots using `PdfPages.savefig()` will be written to a file at this location. Any older file with the same name is overwritten.

**keep\_empty** [bool, optional] If set to False, then empty pdf files will be deleted automatically when closed.

**metadata** [dictionary, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.:  
{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome fig'}

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Producer', 'Creator' and 'Trapped'. Values have been predefined for 'Creator' and 'Producer'. They can be removed by setting them to the empty string.

`close()`

Finalize this object, running LaTeX in a temporary directory and moving the final pdf file to `filename`.

`get_pagecount()`

Returns the current number of pages in the multipage pdf file.

`keep_empty`

`metadata`

`savefig(figure=None, **kwargs)`

Saves a *Figure* to this file as a new page.

Any other keyword arguments are passed to `savefig()`.

### Parameters

**figure** [*Figure* or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a *Figure* instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

`class matplotlib.backends.backend_pgf.RendererPgf(figure, fh, dummy=False)`

Bases: `matplotlib.backend_bases.RendererBase`

Creates a new PGF renderer that translates any drawing instruction into text commands to be interpreted in a latex pgfpicture environment.

### Attributes

**figure** [`matplotlib.figure.Figure`] Matplotlib figure to initialize height, width and dpi from.

**fh** [file-like] File handle for the output of the drawing commands.

`draw_image(gc, x, y, im, transform=None)`

Draw an RGBA image.

### Parameters

**gc** [`GraphicsContextBase`] a graphics context with clipping information.

**x** [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y** [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im** [array\_like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

**transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option\_scale\_image()* returns True, an affine transformation *may* be passed to *draw\_image()*. It takes the form of a *Affine2DBase* instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

*draw\_markers(gc, marker\_path, marker\_trans, path, trans, rgbFace=None)*

Draws a marker at each of the vertices in *path*. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of *draw\_markers* that makes multiple calls to *draw\_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

**gc** [*GraphicsContextBase*] The graphics context

**marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

*draw\_path(gc, path, transform, rgbFace=None)*

Draws a *Path* instance using the given affine transform.

*draw\_tex(gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)*

*draw\_text(gc, x, y, s, prop, angle, ismath=False, mtext=None)*

Draw the text instance

### Parameters

**gc** [*GraphicsContextBase*] the graphics context

**x** [scalar] the x location of the text in display coords

**y** [scalar] the y location of the text baseline in display coords

**s** [str] the text string

**prop** [*matplotlib.font\_manager.FontProperties*] font properties

**angle** [scalar] the rotation angle in degrees

**mtext** [*matplotlib.text.Text*] the original text object to be rendered

### Notes

#### backend implementers note

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in *text.py*:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`flipy()`

Return true if y small numbers are top for renderer Is used for drawing text (*matplotlib.text*) and images (*matplotlib.image*) only

`get_canvas_width_height()`

return the canvas width and height in display coords

`get_text_width_height_descent(s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties prop*

`new_gc()`

Return an instance of a GraphicsContextBase

`option_image_nocomposite()`

return whether to generate a composite image from multiple images on a set of axes

`option_scale_image()`

pgf backend supports affine transform of image.

`points_to_pixels(points)`

Convert points to display units

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72.0 * dpi/72.0
```

### Parameters

**points** [scalar or array\_like] a float or a numpy array of float

### Returns

**Points converted to pixels**

```
class matplotlib.backends.backend_pgf.TmpDirCleaner
```

Bases: `object`

```
static add(tmpdir)
```

```
static cleanup_remaining_tmpdirs()
```

```
remaining_tmpdirs = set()
```

```
matplotlib.backends.backend_pgf.common_texification(text)
```

Do some necessary and/or useful substitutions for texts to be included in LaTeX documents.

```
matplotlib.backends.backend_pgf.get_fontspec()
```

Build fontspec preamble from rc.

```
matplotlib.backends.backend_pgf.get_preamble()
```

Get LaTeX preamble from rc.

```
matplotlib.backends.backend_pgf.get_texcommand()
```

Deprecated since version 3.0: The `get_texcommand` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

Get chosen TeX system from rc.

```
matplotlib.backends.backend_pgf.make_pdf_to_png_converter()
    Returns a function that converts a pdf file to a png file.
matplotlib.backends.backend_pgf.repl_escapetext(m)
matplotlib.backends.backend_pgf.repl_mathdefault(m)
matplotlib.backends.backend_pgf.writeln(fh, line)
```

### 18.9.12 matplotlib.backends.backend\_ps

A PostScript backend, which can produce both PostScript .ps and .eps.

```
matplotlib.backends.backend_ps.FigureCanvas
    alias of matplotlib.backends.backend_ps.FigureCanvasPS
class matplotlib.backends.backend_ps.FigureCanvasPS(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase
    draw()
        Render the Figure.
    filetypes = {'eps': 'Encapsulated Postscript', 'ps': 'Postscript'}
    fixed_dpi = 72
    get_default_filetype()
        Get the default savefig file format as specified in rcParam savefig.format. Returned
        string excludes period. Overridden in backends that only support a single file type.
    print_eps(outfile, *args, **kwargs)
    print_ps(outfile, *args, **kwargs)
class matplotlib.backends.backend_ps.GraphicsContextPS
    Bases: matplotlib.backend_bases.GraphicsContextBase
    get_capstyle()
        Return the capstyle as a string in ('butt', 'round', 'projecting')
    get_joinstyle()
        Return the line join style as one of ('miter', 'round', 'bevel')
    shouldstroke()
class matplotlib.backends.backend_ps.PsBackendHelper
    Bases: object
    gs_exe
        executable name of ghostscript.
    gs_version
        version of ghostscript.
    supports_ps2write
        True if the installed ghostscript supports ps2write device.
class matplotlib.backends.backend_ps.RendererPS(width, height, pswriter, im-
agedpi=72)
    Bases: matplotlib.backend_bases.RendererBase
```

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles.

Although postscript itself is dpi independent, we need to inform the image code about a requested dpi to generate high res images and then scale them before embedding them

```
afmfontd = {}
```

```
create_hatch(hatch)
```

```
draw_gouraud_triangle(gc, points, colors, trans)  
    Draw a Gouraud-shaded triangle.
```

#### Parameters

**points** [array\_like, shape=(3, 2)] Array of (x, y) points for the triangle.

**colors** [array\_like, shape=(3, 4)] RGBA colors for each point of the triangle.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```
draw_gouraud_triangles(gc, points, colors, trans)  
    Draws a series of Gouraud triangles.
```

#### Parameters

**points** [array\_like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.

**colors** [array\_like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```
draw_image(gc, x, y, im, transform=None)
```

Draw the Image instance into the current axes; *x* is the distance in pixels from the left hand side of the canvas and *y* is the distance from bottom

```
draw_markers(gc, marker_path, marker_trans, path, trans, rgbFace=None)
```

Draw the markers defined by *path* at each of the positions in *x* and *y*. *path* coordinates are points, *x* and *y* coords will be transformed by the transform

```
draw_mathtext(gc, x, y, s, prop, angle)
```

Draw the math text using `matplotlib.mathtext`

```
draw_path(gc, path, transform, rgbFace=None)
```

Draws a Path instance using the given affine transform.

```
draw_path_collection(gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyle, antialiaseds, urls, offset_position)
```

Draws a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyle* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied. *offset\_position* may be either "screen" or "data" depending on the space that the offsets are in.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order

to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

`draw_text(gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)`  
draw a Text instance

`draw_text(gc, x, y, s, prop, angle, ismath=False, mtext=None)`  
Draw a Text instance.

`flipy()`  
return true if small y numbers are top for renderer

`get_canvas_width_height()`  
return the canvas width and height in display coords

`get_image_magnification()`  
Get the factor by which to magnify images passed to `draw_image`. Allows a backend to have images at a different resolution to other artists.

`get_text_width_height_descent(s, prop, ismath)`  
get the width and height in display coords of the string `s` with `FontProperty` `prop`

`merge_used_characters(other)`

`new_gc()`  
Return an instance of a `GraphicsContextBase`

`option_image_nocomposite()`  
return whether to generate a composite image from multiple images on a set of axes

`option_scale_image()`  
ps backend support arbitrary scaling of image.

`set_color(r, g, b, store=1)`

`set_font(fontname, fontsize, store=1)`

`set_linecap(linecap, store=1)`

`set_linedash(offset, seq, store=1)`

`set_linejoin(linejoin, store=1)`

`set_linewidth(linewidth, store=1)`

`track_characters(font, s)`  
Keeps track of which characters are required from each font.

`matplotlib.backends.backend_ps.convert_psfrags(tmpfile, psfrags, font_preamble, custom_preamble, paperWidth, paperHeight, orientation)`

When we want to use the LaTeX backend with postscript, we write PSFrag tags to a temporary postscript file, each one marking a position for LaTeX to render some text. `convert_psfrags` generates a LaTeX document containing the commands to convert those tags to text. LaTeX/dvips produces the postscript file that includes the actual text.

`matplotlib.backends.backend_ps.get_bbox(tmpfile, bbox)`  
Deprecated since version 3.0: The `get_bbox` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

Use ghostscript's `bbox` device to find the center of the bounding box. Return an appropriately sized `bbox` centered around that point. A bit of a hack.

`matplotlib.backends.backend_ps.get_bbox_header(lbrt, rotated=False)`  
return a postscript header string for the given `bbox` `lbrt=(l, b, r, t)`. Optionally, return rotate command.

`matplotlib.backends.backend_ps.gs_distill(tmpfile, eps=False, ptype='letter',  
bbox=None, rotated=False)`  
Use ghostscript's `pswrite` or `epswrite` device to distill a file. This yields smaller files without illegal encapsulated postscript operators. The output is low-level, converting text to outlines.

`matplotlib.backends.backend_ps.pstoeps(tmpfile, bbox=None, rotated=False)`  
Convert the postscript to encapsulated postscript. The `bbox` of the `eps` file will be replaced with the given `bbox` argument. If `None`, original `bbox` will be used.

`matplotlib.backends.backend_ps.quote_ps_string(s)`  
Quote dangerous characters of `S` for use in a PostScript string constant.

`matplotlib.backends.backend_ps.xpdf_distill(tmpfile, eps=False, ptype='letter',  
bbox=None, rotated=False)`  
Use ghostscript's `ps2pdf` and `xpdf`'s/`poppler`'s `pdftops` to distill a file. This yields smaller files without illegal encapsulated postscript operators. This distiller is preferred, generating high-level postscript output that treats text as text.

### 18.9.13 `matplotlib.backends.backend_qt4agg`

**NOTE** Not included, to avoid adding a dependency to building the docs.

### 18.9.14 `matplotlib.backends.backend_qt4cairo`

**NOTE** Not included, to avoid adding a dependency to building the docs.

### 18.9.15 `matplotlib.backends.backend_qt5agg`

**NOTE** Not included, to avoid adding a dependency to building the docs.

### 18.9.16 `matplotlib.backends.backend_qt5cairo`

**NOTE** Not included, to avoid adding a dependency to building the docs.

### 18.9.17 `matplotlib.backends.backend_svg`

`matplotlib.backends.backend_svg.FigureCanvas`  
alias of `matplotlib.backends.backend_svg.FigureCanvasSVG`

`class matplotlib.backends.backend_svg.FigureCanvasSVG(figure)`  
Bases: `matplotlib.backends.backend_bases.FigureCanvasBase`

`filetypes = {'svg': 'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphics'}`

```

fixed_dpi = 72
get_default_filetype()
    Get the default savefig file format as specified in rcParam savefig.format. Returned
    string excludes period. Overridden in backends that only support a single file type.
print_svg(filename, *args, **kwargs)
print_svgz(filename, *args, **kwargs)
class matplotlib.backends.backend_svg.RendererSVG(width, height, svgwriter, base-
                                                name=None, image_dpi=72)
    Bases: matplotlib.backend_bases.RendererBase
close_group(s)
    Close a grouping element with label s Is only currently used by backend_svg
draw_gouraud_triangle(gc, points, colors, trans)
    Draw a Gouraud-shaded triangle.

```

### Parameters

- points** [array\_like, shape=(3, 2)] Array of (x, y) points for the triangle.
- colors** [array\_like, shape=(3, 4)] RGBA colors for each point of the triangle.
- transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```

draw_gouraud_triangles(gc, triangles_array, colors_array, transform)
    Draws a series of Gouraud triangles.

```

### Parameters

- points** [array\_like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.
- colors** [array\_like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.
- transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```

draw_image(gc, x, y, im, transform=None)
    Draw an RGBA image.

```

### Parameters

- gc** [GraphicsContextBase] a graphics context with clipping information.
- x** [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- y** [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- im** [array\_like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option\_scale\_image()* returns True, an affine transformation *may* be passed to *draw\_image()*. It takes the form of a *Affine2DBase* instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the

transformation does not override  $x$  and  $y$ , and has to be applied *before* translating the result by  $x$  and  $y$  (this can be accomplished by adding  $x$  and  $y$  to the translation vector defined by `transform`).

`draw_markers(gc, marker_path, marker_trans, path, trans, rgbFace=None)`

Draws a marker at each of the vertices in `path`. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

**gc** [GraphicsContextBase] The graphics context

**marker\_trans** [`matplotlib.transforms.Transform`] An affine transform applied to the marker.

**trans** [`matplotlib.transforms.Transform`] An affine transform applied to the path.

`draw_path(gc, path, transform, rgbFace=None)`

Draws a `Path` instance using the given affine transform.

`draw_path_collection(gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)`

Draws a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyles` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied. `offset_position` may be either "screen" or "data" depending on the space that the offsets are in.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

`draw_tex(gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)`

`draw_text(gc, x, y, s, prop, angle, ismath=False, mtext=None)`

Draw the text instance

### Parameters

**gc** [GraphicsContextBase] the graphics context

**x** [scalar] the x location of the text in display coords

**y** [scalar] the y location of the text baseline in display coords

**s** [str] the text string

**prop** [`matplotlib.font_manager.FontProperties`] font properties

**angle** [scalar] the rotation angle in degrees

**mtext** [*matplotlib.text.Text*] the original text object to be rendered

## Notes

### backend implementers note

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`finalize()`

`flipy()`

Return true if y small numbers are top for renderer Is used for drawing text (*matplotlib.text*) and images (*matplotlib.image*) only

`get_canvas_width_height()`

return the canvas width and height in display coords

`get_image_magnification()`

Get the factor by which to magnify images passed to *draw\_image()*. Allows a backend to have images at a different resolution to other artists.

`get_text_width_height_descent(s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties prop*

`open_group(s, gid=None)`

Open a grouping element with label *s*. If *gid* is given, use *gid* as the id of the group.

`option_image_nocomposite()`

return whether to generate a composite image from multiple images on a set of axes

`option_scale_image()`

override this method for renderers that support arbitrary affine transformations in *draw\_image()* (most vector backends).

`class matplotlib.backends.backend_svg.XMLWriter(file)`

Bases: `object`

`close(id)`

`comment(comment)`

`data(text)`

`element(tag, text=None, attrib={}, **extra)`

`end(tag=None, indent=True)`

`flush()`

`start(tag, attrib={}, **extra)`

`matplotlib.backends.backend_svg.escape_attrib(s)`

`matplotlib.backends.backend_svg.escape_cdata(s)`

`matplotlib.backends.backend_svg.escape_comment(s)`

```
matplotlib.backends.backend_svg.generate_css(attrib={})
```

```
matplotlib.backends.backend_svg.generate_transform(transform_list=[])
```

```
matplotlib.backends.backend_svg.short_float_fmt(x)
```

Create a short string representation of a float, which is %f formatting with trailing zeros and the decimal point removed.

### 18.9.18 matplotlib.backends.backend\_tkagg

```
matplotlib.backends.backend_tkagg.FigureCanvas
```

alias of *matplotlib.backends.backend\_tkagg.FigureCanvasTkAgg*

```
class matplotlib.backends.backend_tkagg.FigureCanvasTkAgg(figure, master=None, re-  
size_callback=None)
```

Bases: *matplotlib.backends.backend\_agg.FigureCanvasAgg*, *matplotlib.backends.\_backend\_tk.FigureCanvasTk*

```
blit(bbox=None)
```

Blit the canvas in *bbox* (default entire canvas).

```
draw()
```

Draw the figure using the renderer.

### 18.9.19 matplotlib.backends.backend\_webagg

---

**Note:** The WebAgg backend is not documented here, in order to avoid adding Tornado to the doc build requirements.

---

### 18.9.20 matplotlib.backends.backend\_wxagg

```
matplotlib.backends.backend_wxagg.FigureCanvas
```

alias of *matplotlib.backends.backend\_wxagg.FigureCanvasWxAgg*

```
class matplotlib.backends.backend_wxagg.FigureCanvasWxAgg(parent, id, figure)
```

Bases: *matplotlib.backends.backend\_agg.FigureCanvasAgg*, *matplotlib.backends.backend\_wx.\_FigureCanvasWxBase*

The *FigureCanvas* contains the figure and does event handling.

In the wxPython backend, it is derived from *wxPanel*, and (usually) lives inside a frame instantiated by a *FigureManagerWx*. The parent window probably implements a *wxSizer* to control the displayed control size - but we give a hint as to our preferred minimum size.

Initialise a *FigureWx* instance.

- Initialise the *FigureCanvasBase* and *wxPanel* parents.
- Set event handlers for: *EVT\_SIZE* (Resize event) *EVT\_PAINT* (Paint event)

```
blit(bbox=None)
```

Transfer the region of the agg buffer defined by *bbox* to the display. If *bbox* is *None*, the entire buffer is transferred.

```

draw(drawDC=None)
    Render the figure using agg.

filetypes = {'eps': 'Encapsulated Postscript', 'jpeg': 'Joint Photographic Experts Group', 'jpg':
class matplotlib.backends.backend_wxagg.FigureFrameWxAgg(num, fig)
    Bases: matplotlib.backends.backend_wx.FigureFrameWx

    get_canvas(fig)

```

## 18.10 blocking\_input

### 18.10.1 matplotlib.blocking\_input

This provides several classes used for blocking interaction with figure windows:

*BlockingInput* Creates a callable object to retrieve events in a blocking way for interactive sessions. Base class of the other classes listed here.

*BlockingKeyMouseInput* Creates a callable object to retrieve key or mouse clicks in a blocking way for interactive sessions. Used by `waitforbuttonpress`.

*BlockingMouseInput* Creates a callable object to retrieve mouse clicks in a blocking way for interactive sessions. Used by `ginput`.

*BlockingContourLabeler* Creates a callable object to retrieve mouse clicks in a blocking way that will then be used to place labels on a `ContourSet`. Used by `clabel`.

```

class matplotlib.blocking_input.BlockingContourLabeler(CS)
    Bases: matplotlib.blocking_input.BlockingMouseInput

```

Callable for retrieving mouse clicks and key presses in a blocking way.

Used to place contour labels.

```
add_click(event)
```

Add the coordinates of an event to the list of clicks.

```
button1(event)
```

Process an button-1 event (add a label to a contour).

```
button3(event)
```

Process an button-3 event (remove a label if not in inline mode).

Unfortunately, if one is doing inline labels, then there is currently no way to fix the broken contour - once humpty-dumpty is broken, he can't be put back together. In inline mode, this does nothing.

```
pop_click(event, index=-1)
```

Remove a click (by default, the last) from the list of clicks.

```

class matplotlib.blocking_input.BlockingInput(fig, eventslist=())
    Bases: object

```

Callable for retrieving events in a blocking way.

```
add_event(event)
```

For base class, this just appends an event to events.

```
cleanup()
```

Disconnect all callbacks.

`on_event(event)`

Event handler; will be passed to the current figure to retrieve events.

`pop(index=-1)`

Remove an event from the event list - by default, the last.

Note that this does not check that there are events, much like the normal pop method. If no events exist, this will throw an exception.

`pop_event(index=-1)`

Remove an event from the event list - by default, the last.

Note that this does not check that there are events, much like the normal pop method. If no events exist, this will throw an exception.

`post_event()`

For baseclass, do nothing but collect events.

`class matplotlib.blocking_input.BlockingKeyMouseInput(fig)`

Bases: *matplotlib.blocking\_input.BlockingInput*

Callable for retrieving mouse clicks and key presses in a blocking way.

`post_event()`

Determine if it is a key event.

`class matplotlib.blocking_input.BlockingMouseInput(fig, mouse_add=1, mouse_pop=3, mouse_stop=2)`

Bases: *matplotlib.blocking\_input.BlockingInput*

Callable for retrieving mouse clicks in a blocking way.

This class will also retrieve keypresses and map them to mouse clicks: delete and backspace are like mouse button 3, enter is like mouse button 2 and all others are like mouse button 1.

`add_click(event)`

Add the coordinates of an event to the list of clicks.

`button_add = 1`

`button_pop = 3`

`button_stop = 2`

`cleanup(event=None)`

Disconnect all callbacks.

`key_event()`

Process a key press event, mapping keys to appropriate mouse clicks.

`mouse_event()`

Process a mouse click event.

`mouse_event_add(event)`

Process an button-1 event (add a click if inside axes).

`mouse_event_pop(event)`

Process an button-3 event (remove the last click).

`mouse_event_stop(event)`

Process an button-2 event (end blocking input).

`pop(event, index=-1)`

Removes a click and the associated event from the list of clicks.

Defaults to the last click.

```
pop_click(event, index=-1)
```

Remove a click (by default, the last) from the list of clicks.

```
post_event()
```

Process an event.

## 18.11 cbook

### 18.11.1 matplotlib.cbook

A collection of utility functions and classes. Originally, many (but not all) were from the Python Cookbook - hence the name cbook.

This module is safe to import from anywhere within matplotlib; it imports matplotlib only at runtime.

```
class matplotlib.cbook.Bunch(**kwargs)
```

Bases: `types.SimpleNamespace`

Deprecated since version 3.0: The Bunch class was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use `types.SimpleNamespace` instead.

Often we want to just collect a bunch of stuff together, naming each item of the bunch; a dictionary's OK for that, but a small do-nothing class is even handier, and prettier to use. Whenever you want to group a few variables:

```
>>> point = Bunch(datum=2, squared=4, coord=12)
>>> point.datum
```

```
class matplotlib.cbook.CallbackRegistry(exception_handler=<function          _except-
                                       tion_printer>)
```

Bases: `object`

Handle registering and disconnecting for a set of signals and callbacks:

```
>>> def oneat(x):
...     print('eat', x)
>>> def ondrink(x):
...     print('drink', x)
```

```
>>> from matplotlib.cbook import CallbackRegistry
>>> callbacks = CallbackRegistry()
```

```
>>> id_eat = callbacks.connect('eat', oneat)
>>> id_drink = callbacks.connect('drink', ondrink)
```

```
>>> callbacks.process('drink', 123)
drink 123
>>> callbacks.process('eat', 456)
eat 456
>>> callbacks.process('be merry', 456) # nothing will be called
>>> callbacks.disconnect(id_eat)
>>> callbacks.process('eat', 456)      # nothing will be called
```

In practice, one should always disconnect all callbacks when they are no longer needed to avoid dangling references (and thus memory leaks). However, real code in Matplotlib rarely does so, and due to its design, it is rather difficult to place this kind of code. To get around this, and prevent this class of memory leaks, we instead store weak references to bound methods only, so when the destination object needs to die, the CallbackRegistry won't keep it alive.

### Parameters

**exception\_handler** [callable, optional] If provided must have signature

```
def handler(exc: Exception) -> None:
```

If not None this function will be called with any `Exception` subclass raised by the callbacks in `CallbackRegistry.process`. The handler may either consume the exception or re-raise.

The callable must be pickle-able.

The default handler is

```
def h(exc):
    traceback.print_exc()
```

`connect(s, func)`

Register `func` to be called when signal `s` is generated.

`disconnect(cid)`

Disconnect the callback registered with callback id `cid`.

`process(s, *args, **kwargs)`

Process signal `s`.

All of the functions registered to receive callbacks on `s` will be called with `*args` and `**kwargs`.

`class matplotlib.cbook.GetRealpathAndStat(**kwargs)`

Bases: `object`

Deprecated since version 3.0: The `GetRealpathAndStat` class was deprecated in Matplotlib 3.0 and will be removed in 3.2.

`class matplotlib.cbook.Grouper(init=())`

Bases: `object`

This class provides a lightweight way to group arbitrary objects together into disjoint sets when a full-blown graph data structure would be overkill.

Objects can be joined using `join()`, tested for connectedness using `joined()`, and all disjoint sets can be retrieved by using the object as an iterator.

The objects being joined must be hashable and weak-referenceable.

For example:

```
>>> from matplotlib.cbook import Grouper
>>> class Foo(object):
...     def __init__(self, s):
...         self.s = s
...     def __repr__(self):
...         return self.s
```

(continues on next page)

(continued from previous page)

```

...
>>> a, b, c, d, e, f = [Foo(x) for x in 'abcdef']
>>> grp = Grouper()
>>> grp.join(a, b)
>>> grp.join(b, c)
>>> grp.join(d, e)
>>> sorted(map(tuple, grp))
[(a, b, c), (d, e)]
>>> grp.joined(a, b)
True
>>> grp.joined(a, c)
True
>>> grp.joined(a, d)
False

```

`clean()`

Clean dead weak references from the dictionary.

`get_siblings(a)`

Returns all of the items joined with *a*, including itself.

`join(a, *args)`

Join given arguments into the same set. Accepts one or more arguments.

`joined(a, b)`

Returns True if *a* and *b* are members of the same set.

`remove(a)`

exception `matplotlib.cbook.IgnoredKeywordWarning`

Bases: `UserWarning`

A class for issuing warnings about keyword arguments that will be ignored by matplotlib

class `matplotlib.cbook.Locked(**kwargs)`

Bases: `object`

Deprecated since version 3.0: The `Locked` class was deprecated in Matplotlib 3.0 and will be removed in 3.2.

Context manager to handle locks.

Based on code from conda.

(c) 2012-2013 Continuum Analytics, Inc. / <https://www.continuum.io/> All Rights Reserved

conda is distributed under the terms of the BSD 3-clause license. Consult LICENSE\_CONDA or <https://opensource.org/licenses/BSD-3-Clause>.

`LOCKFN = '.matplotlib_lock'`

exception `TimeoutError`

Bases: `RuntimeError`

class `matplotlib.cbook.Stack(default=None)`

Bases: `object`

Stack of elements with a movable cursor.

Mimics home/back/forward in a web browser.

`back()`

Move the position back and return the current element.

`bubble(o)`

Raise *o* to the top of the stack. *o* must be present in the stack.

*o* is returned.

`clear()`

Empty the stack.

`empty()`

Return whether the stack is empty.

`forward()`

Move the position forward and return the current element.

`home()`

Push the first element onto the top of the stack.

The first element is returned.

`push(o)`

Push *o* to the stack at current position. Discard all later elements.

*o* is returned.

`remove(o)`

Remove *o* from the stack.

`matplotlib.cbook.align_iterators(func, *iterables)`

Deprecated since version 2.2: The `align_iterators` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

This generator takes a bunch of iterables that are ordered by `func`. It sends out ordered tuples:

```
(func(row), [rows from all iterators matching func(row)])
```

It is used by `matplotlib.mlab.recs_join()` to join record arrays

`matplotlib.cbook.boxplot_stats(X, whis=1.5, bootstrap=None, labels=None, autorange=False)`

Returns list of dictionaries of statistics used to draw a series of box and whisker plots. The Returns section enumerates the required keys of the dictionary. Users can skip this function and pass a user-defined set of dictionaries to the new `axes.bxp` method instead of relying on MPL to do the calculations.

### Parameters

**X** [array-like] Data that will be represented in the boxplots. Should have 2 or fewer dimensions.

**whis** [float, string, or sequence (default = 1.5)] As a float, determines the reach of the whiskers to the beyond the first and third quartiles. In other words, where IQR is the interquartile range (Q3-Q1), the upper whisker will extend to last datum less than  $Q3 + whis * IQR$ . Similarly, the lower whisker will extend to the first datum greater than  $Q1 - whis * IQR$ . Beyond the whiskers, data are considered outliers and are plotted as individual points. This can be set this to an ascending sequence of percentile (e.g., [5, 95]) to set the whiskers at specific percentiles of the data. Finally, `whis` can be the string 'range' to force the whiskers to the minimum and

maximum of the data. In the edge case that the 25th and 75th percentiles are equivalent, `whis` can be automatically set to 'range' via the `autorange` option.

**bootstrap** [int, optional] Number of times the confidence intervals around the median should be bootstrapped (percentile method).

**labels** [array-like, optional] Labels for each dataset. Length must be compatible with dimensions of `x`.

**autorange** [bool, optional (False)] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to 'range' such that the whisker ends are at the minimum and maximum of the data.

### Returns

**bxpstats** [list of dict] A list of dictionaries containing the results for each column of data. Keys of each dictionary are the following:

Key	Value Description
label	tick label for the boxplot
mean	arithmetic mean value
med	50th percentile
q1	first quartile (25th percentile)
q3	third quartile (75th percentile)
cilo	lower notch around the median
cihi	upper notch around the median
whislo	end of the lower whisker
whishi	end of the upper whisker
fliers	outliers

### Notes

Non-bootstrapping approach to confidence interval uses Gaussian- based asymptotic approximation:

$$\text{med} \pm 1.57 \times \frac{\text{iqr}}{\sqrt{N}} \quad (18.3)$$

General approach from: McGill, R., Tukey, J.W., and Larsen, W.A. (1978) "Variations of Boxplots", *The American Statistician*, 32:12-16.

`matplotlib.cbook.contiguous_regions(mask)`

Return a list of (ind0, ind1) such that `mask[ind0:ind1].all()` is `True` and we cover all such regions

`matplotlib.cbook.dedent(s)`

Remove excess indentation from docstring `s`.

Discards any leading blank lines, then removes up to `n` whitespace characters from each line, where `n` is the number of leading whitespace characters in the first line. It differs from `textwrap.dedent` in its deletion of leading blank lines and its use of the first non-blank line to determine the indentation.

It is also faster in most cases.

`matplotlib.cbook.delete_masked_points(*args)`

Find all masked and/or non-finite points in a set of arguments, and return the arguments with only the unmasked points remaining.

Arguments can be in any of 5 categories:

1. 1-D masked arrays
2. 1-D ndarrays
3. ndarrays with more than one dimension
4. other non-string iterables
5. anything else

The first argument must be in one of the first four categories; any argument with a length differing from that of the first argument (and hence anything in category 5) then will be passed through unchanged.

Masks are obtained from all arguments of the correct length in categories 1, 2, and 4; a point is bad if masked in a masked array or if it is a nan or inf. No attempt is made to extract a mask from categories 2, 3, and 4 if `np.isfinite()` does not yield a Boolean array.

All input arguments that are not passed unchanged are returned as ndarrays after removing the points or rows corresponding to masks in any of the arguments.

A vastly simpler version of this function was originally written as a helper for `Axes.scatter()`.

`matplotlib.cbook.file_requires_unicode(x)`

Returns `True` if the given writable file-like object requires Unicode to be written to it.

`matplotlib.cbook.flatten(seq, scalarp=<function is_scalar_or_string>)`

Returns a generator of flattened nested containers

For example:

```
>>> from matplotlib.cbook import flatten
>>> l = (('John', ['Hunter']), (1, 23), [[[42, (5, 23)], ]])
>>> print(list(flatten(l)))
['John', 'Hunter', 1, 23, 42, 5, 23]
```

By: Composite of Holger Krekel and Luther Blissett From: <https://code.activestate.com/recipes/121294/> and Recipe 1.12 in cookbook

`matplotlib.cbook.get_label(y, default_name)`

`matplotlib.cbook.get_realpath_and_stat`

`matplotlib.cbook.get_sample_data(fname, asfileobj=True)`

Return a sample data file. *fname* is a path relative to the `mpl-data/sample_data` directory. If *asfileobj* is `True` return a file object, otherwise just a file path.

Set the `rc` parameter `examples.directory` to the directory where we should look, if `sample_data` files are stored in a location different than default (which is `'mpl-data/sample_data'` at the same level of `'matplotlib'` Python module files).

If the filename ends in `.gz`, the file is implicitly ungzipped.

`matplotlib.cbook.index_of(y)`

A helper function to get the index of an input to plot against if x values are not explicitly given.

Tries to get `y.index` (works if this is a `pd.Series`), if that fails, return `np.arange(y.shape[0])`.

This will be extended in the future to deal with more types of labeled data.

### Parameters

**y** [scalar or array-like] The proposed y-value

### Returns

**x, y** [ndarray] The x and y values to plot.

`matplotlib.cbook.is_hashable(obj)`

Returns true if *obj* can be hashed

`matplotlib.cbook.is_math_text(s)`

`matplotlib.cbook.is_numlike(obj)`

Deprecated since version 3.0: `isinstance(..., numbers.Number)`

return true if *obj* looks like a number

`matplotlib.cbook.is_scalar_or_string(val)`

Return whether the given object is a scalar or string like.

`matplotlib.cbook.is_writable_file_like(obj)`

return true if *obj* looks like a file object with a *write* method

`matplotlib.cbook.iterable(obj)`

return true if *obj* is iterable

`matplotlib.cbook.listFiles(root, patterns='*', recurse=1, return_folders=0)`

Deprecated since version 3.0: The `listFiles` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

Recursively list files

from Parmar and Martelli in the Python Cookbook

`matplotlib.cbook.local_over_kwdict(local_var, kwargs, *keys)`

Enforces the priority of a local variable over potentially conflicting argument(s) from a `kwargs` dict. The following possible output values are considered in order of priority:

`local_var > kwargs[keys[0]] > ... > kwargs[keys[-1]]`

The first of these whose value is not `None` will be returned. If all are `None` then `None` will be returned. Each key in `keys` will be removed from the `kwargs` dict in place.

### Parameters

**local\_var:** any object

The local variable (highest priority)

**kwargs:** dict Dictionary of keyword arguments; modified in place

**keys:** str(s) Name(s) of keyword arguments to process, in descending order of priority

### Returns

**out:** any object Either `local_var` or one of `kwargs[key]` for key in `keys`

### Raises

**IgnoredKeywordWarning** For each key in `keys` that is removed from `kwargs` but not used as the output value

```
class matplotlib.cbook.maxdict(maxsize)
```

Bases: `dict`

A dictionary with a maximum size; this doesn't override all the relevant methods to constrain the size, just `setitem`, so use with caution

```
matplotlib.cbook.mkdirs(newdir, mode=511)
```

Deprecated since version 3.0: The `mkdirs` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

make directory *newdir* recursively, and set *mode*. Equivalent to

```
> mkdir -p NEWDIR
> chmod MODE NEWDIR
```

```
matplotlib.cbook.normalize_kwargs(kw, alias_mapping=None, required=(), forbidden=(), allowed=None)
```

Helper function to normalize kwarg inputs

The order they are resolved are:

1. aliasing
2. required
3. forbidden
4. allowed

This order means that only the canonical names need appear in `allowed`, `forbidden`, `required`

### Parameters

**alias\_mapping, dict, optional** A mapping between a canonical name to a list of aliases, in order of precedence from lowest to highest.

If the canonical value is not in the list it is assumed to have the highest priority.

**required** [iterable, optional] A tuple of fields that must be in kwargs.

**forbidden** [iterable, optional] A list of keys which may not be in kwargs

**allowed** [tuple, optional] A tuple of allowed fields. If this not `None`, then raise if `kw` contains any keys not in the union of `required` and `allowed`. To allow only the required fields pass in `()` for `allowed`

### Raises

**TypeError** To match what python raises if invalid args/kwargs are passed to a callable.

```
matplotlib.cbook.open_file_cm(path_or_file, mode='r', encoding=None)
```

Pass through file objects and context-manage `PathLikes`.

```
matplotlib.cbook.print_cycles(objects, outstream=<_io.TextIOWrapper
                                name='<stdout>' mode='w' encoding='UTF-8'>,
                                show_progress=False)
```

**objects** A list of objects to find cycles in. It is often useful to pass in `gc.garbage` to find the cycles that are preventing some objects from being garbage collected.

**outstream** The stream for output.

**show\_progress** If True, print the number of objects reached as they are found.

```
matplotlib.cbook.pts_to_midstep(x, *args)
```

Convert continuous line to mid-steps.

Given a set of  $N$  points convert to  $2N$  points which when connected linearly give a step function which changes values at the middle of the intervals.

#### Parameters

**x** [array] The x location of the steps. May be empty.

**y1, ..., yp** [array] y arrays to be turned into steps; all must be the same length as x.

#### Returns

**out** [array] The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length  $N$ , each of these arrays will be length  $2N$ .

#### Examples

```
>> x_s, y1_s, y2_s = pts_to_midstep(x, y1, y2)
```

```
matplotlib.cbook.pts_to_poststep(x, *args)
```

Convert continuous line to post-steps.

Given a set of  $N$  points convert to  $2N + 1$  points, which when connected linearly give a step function which changes values at the end of the intervals.

#### Parameters

**x** [array] The x location of the steps. May be empty.

**y1, ..., yp** [array] y arrays to be turned into steps; all must be the same length as x.

#### Returns

**out** [array] The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length  $N$ , each of these arrays will be length  $2N + 1$ . For  $N=0$ , the length will be 0.

#### Examples

```
>> x_s, y1_s, y2_s = pts_to_poststep(x, y1, y2)
```

```
matplotlib.cbook.pts_to_prestep(x, *args)
```

Convert continuous line to pre-steps.

Given a set of  $N$  points, convert to  $2N - 1$  points, which when connected linearly give a step function which changes values at the beginning of the intervals.

#### Parameters

**x** [array] The x location of the steps. May be empty.

**y1, ..., yp** [array] y arrays to be turned into steps; all must be the same length as x.

## Returns

**out** [array] The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length `N`, each of these arrays will be length `2N + 1`. For `N=0`, the length will be 0.

## Examples

```
>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)
matplotlib.cbook.report_memory(i=0)
    return the memory consumed by process
matplotlib.cbook.safe_first_element(obj)
matplotlib.cbook.safe_masked_invalid(x, copy=False)
matplotlib.cbook.safezip(*args)
    make sure args are equal len before zipping
matplotlib.cbook.sanitize_sequence(data)
    Converts dictview object to list
class matplotlib.cbook.silent_list(type, seq=None)
    Bases: list
    override repr when returning a list of matplotlib artists to prevent long, meaningless
    output. This is meant to be used for a homogeneous list of a given type
matplotlib.cbook.simple_linear_interpolation(a, steps)
    Resample an array with steps - 1 points between original point pairs.
```

## Parameters

**a** [array, shape (n, ...)]  
**steps** [int]

## Returns

**array, shape “((n - 1) \* steps + 1, ...)”**  
**Along each column of \*a\*, “(steps - 1)” points are introduced between each original values; the values are linearly interpolated.**

```
matplotlib.cbook.strip_math(s)
    remove latex formatting from mathtext
matplotlib.cbook.to_filehandle(fname, flag='rU', return_opened=False, encoding=None)
    fname can be an os.PathLike or a file handle. Support for gzipped files is automatic, if
    the filename ends in .gz. flag is a read/write flag for file()
matplotlib.cbook.unicode_safe(s)
    Deprecated since version 3.0: The unicode_safe function was deprecated in Matplotlib
    3.0 and will be removed in 3.2.
matplotlib.cbook.violin_stats(X, method, points=100)
    Returns a list of dictionaries of data which can be used to draw a series of violin plots.
    See the Returns section below to view the required keys of the dictionary. Users can skip
```

this function and pass a user-defined set of dictionaries to the `axes.vplot` method instead of using MPL to do the calculations.

### Parameters

**X** [array-like] Sample data that will be used to produce the gaussian kernel density estimates. Must have 2 or fewer dimensions.

**method** [callable] The method used to calculate the kernel density estimate for each column of data. When called via `method(v, coords)`, it should return a vector of the values of the KDE evaluated at the values specified in `coords`.

**points** [scalar, default = 100] Defines the number of points to evaluate each of the gaussian kernel density estimates at.

### Returns

**A list of dictionaries containing the results for each column of data.**

**The dictionaries contain at least the following:**

- `coords`: A list of scalars containing the coordinates this particular kernel density estimate was evaluated at.
- `vals`: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in `coords`.
- `mean`: The mean value for this column of data.
- `median`: The median value for this column of data.
- `min`: The minimum value for this column of data.
- `max`: The maximum value for this column of data.

## 18.12 cm (colormap)

### 18.12.1 matplotlib.cm

Builtin colormaps, colormap handling utilities, and the *ScalarMappable* mixin.

See [/gallery/color/colormap\\_reference](/gallery/color/colormap_reference) for a list of builtin colormaps. See *Colormaps in Matplotlib* for an in-depth discussion of colormaps.

```
class matplotlib.cm.ScalarMappable(norm=None, cmap=None)
```

Bases: `object`

This is a mixin class to support scalar data to RGBA mapping. The *ScalarMappable* makes use of data normalization before returning RGBA colors from the given colormap.

### Parameters

**norm** [*matplotlib.colors.Normalize* instance] The normalizing object which scales data, typically into the interval [0, 1]. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

**cmap** [str or *Colormap* instance] The colormap used to map normalized data values to RGBA colors.

`add_checker(checker)`  
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`autoscale()`  
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`  
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`changed()`  
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`  
If mappable has changed since the last check, return True; else return False

`cmap = None`  
The Colormap instance of this ScalarMappable.

`colorbar = None`  
The last colorbar associated with this ScalarMappable. May be None.

`get_array()`  
Return the array

`get_clim()`  
return the min, max of the color limits for image scaling

`get_cmap()`  
return the colormap

`norm = None`  
The Normalization instance of this ScalarMappable.

`set_array(A)`  
Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_clim(vmin=None, vmax=None)`  
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support setp  
  
ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_cmap(cmap)`  
set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

`set_norm(norm)`  
Set the normalization instance.

**Parameters**

**norm** [*Normalize*]

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be `uint8` in the 0 to 255 range.

If *norm* is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`matplotlib.cm.get_cmap(name=None, lut=None)`

Get a colormap instance, defaulting to rc values if *name* is `None`.

Colormaps added with `register_cmap()` take precedence over built-in colormaps.

If *name* is a `matplotlib.colors.Colormap` instance, it will be returned.

If *lut* is not `None` it must be an integer giving the number of entries desired in the lookup table, and *name* must be a standard mpl colormap name.

`matplotlib.cm.register_cmap(name=None, cmap=None, data=None, lut=None)`

Add a colormap to the set recognized by `get_cmap()`.

It can be used in two ways:

```
register_cmap(name='swirly', cmap=swirly_cmap)

register_cmap(name='choppy', data=choppydata, lut=128)
```

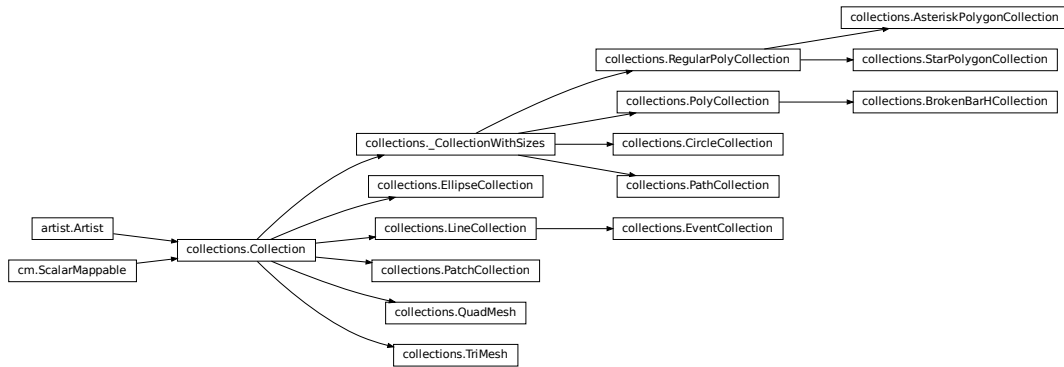

In the first case, *cmap* must be a `matplotlib.colors.Colormap` instance. The *name* is optional; if absent, the name will be the name attribute of the *cmap*.

In the second case, the three arguments are passed to the `LinearSegmentedColormap` initializer, and the resulting colormap is registered.

`matplotlib.cm.revcmmap(data)`

Can only handle specification *data* in dictionary format.

## 18.13 collections

### 18.13.1 matplotlib.collections

Classes for the efficient drawing of large collections of objects that share most properties, e.g., a large number of line segments or polygons.

The classes are not meant to be as flexible as their single element counterparts (e.g., you may not be able to select all line styles) but they are meant to be fast for common use cases (e.g., a large set of solid line segments)

```
class matplotlib.collections.AsteriskPolygonCollection(numsides, rotation=0,
                                                    sizes=(1, ), **kwargs)
```

Bases: `matplotlib.collections.RegularPolygonCollection`

Draw a collection of regular asterisks with *numsides* points.

**numsides** the number of sides of the polygon

**rotation** the rotation of the polygon in radians

**sizes** gives the area of the circle circumscribing the regular polygon in  $\text{points}^2$

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: `transforms.IdentityTransform()`
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

*offsets* and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

Example: see `/gallery/event_handling/lasso_demo` for a complete example:

```
offsets = np.random.rand(20,2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0,0,0,1)

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=(black,),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)
```

`add_callback(func)`

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`

Test whether the mouse event occurred in the collection.

Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

`draw(renderer)`  
Derived classes drawing method

`findobj(match=None, include_self=True)`  
Find artist objects.  
Recursively find all *Artist* instances contained in self.  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child `Artist`'s this `:class:`Artist` contains.

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for `get_linestyle`

`get_datalim(transData)`

`get_edgecolor()`

---

```

get_edgecolors(*args, **kwargs)
    alias for get_edgecolor

get_facecolor()

get_facecolors(*args, **kwargs)
    alias for get_facecolor

get_figure()
    Return the Figure instance the artist belongs to.

get_fill()
    return whether fill is set

get_gid()
    Returns the group id.

get_hatch()
    Return the current hatching pattern.

get_in_layout()
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').

get_joinstyle()

get_label()
    Get the label used for this artist in the legend.

get_linestyle()

get_linestyles(*args, **kwargs)
    alias for get_linestyle

get_linewidth()

get_linewidths(*args, **kwargs)
    alias for get_linewidth

get_lw(*args, **kwargs)
    alias for get_linewidth

get_numsides()

get_offset_position()
    Returns how offsets are applied for the collection. If offset_position is 'screen', the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is 'data', the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()
    Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()
    Return the picker object used by this artist.

get_pickradius()

```

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_rotation()`

`get_sizes()`  
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

**Returns**

**sizes** [array] The 'area' of each element.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`  
Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer** [`RendererBase` instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

**bbbox** [`BboxBase`] containing the bounding box (in figure pixel coordinates).

`get_transform()`  
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`  
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`  
Returns the url.

`get_urls()`

`get_visible()`  
Return the artist's visibility

`get_window_extent(renderer)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`  
Return the artist's zorder.

`have_units()`  
Return *True* if units are set on the x or y axes

`hitlist(event)`  
Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`  
Deprecated since version 2.2: *artist.figure* is not *None*

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`  
Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`  
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`  
Return *True* if *Artist* is pickable.

`properties()`  
return a dictionary mapping property name -> value for all *Artist* props

`remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: *relim()* will not see collections even if the collection was added to axes with *autolim* = *True*.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`  
Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or None]

`set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`

alias for `set_antialiased`

`set_array(A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Box*]`set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters****b** [bool]`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]`set_cmap(cmap)`

set the colormap for luminance data

**Parameters****cmap** [colormap or registered colormap name]`set_color(c)`

Set both the edgecolor and the facecolor.

**See also:***set\_facecolor()*, *set\_edgecolor()* For setting the edge or face color individually.**Parameters****c** [matplotlib color arg or sequence of rgba tuples]`set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

**Parameters****picker** [callable]`set_dashes(*args, **kwargs)`alias for *set\_linestyle*`set_edgecolor(c)`Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches

have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

#### Parameters

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
alias for `set_facecolor`

`set_figure(fig)`

Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(gid)`

Sets the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(hatch)`

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters****hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]`set_in_layout(in_layout)`Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.**Parameters****in\_layout** [bool]`set_joinstyle(js)`

Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

**Parameters****js** [{'miter', 'round', 'bevel'}] The joinstyle`set_label(s)`Set the label to *s* for auto legend.**Parameters****s** [object] *s* will be converted to a string by calling `str`.`set_linestyle(ls)`Set the linestyle(*s*) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where `onoffseq` is an even length tuple of on and off ink in points.**Parameters****ls** [{'-', '-', '-.', ':', '', (offset, on-off-seq), ...}] The line style.`set_linestyles(*args, **kwargs)`alias for `set_linestyle``set_linewidth(lw)`Set the linewidth(*s*) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence**Parameters****lw** [float or sequence of floats]`set_linewidths(*args, **kwargs)`alias for `set_linewidth``set_lw(*args, **kwargs)`alias for `set_linewidth`

`set_norm(norm)`

Set the normalization instance.

**Parameters**

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

**Parameters**

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`

Set the path effects.

**Parameters**

**path\_effects** [*AbstractPathEffect*]

`set_paths()`

`set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the *PickEvent* attributes.

**Parameters**

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

**Parameters**

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

**rasterized** [bool or None]

`set_sizes(sizes, dpi=72.0)`

Set the sizes of each member of the collection.

**Parameters**

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float] The dpi of the canvas. Defaults to 72.0.

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If *scale* is None, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

**Parameters**

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

**Parameters**

**url** [str]

`set_urls(urls)`

**Parameters**

**urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

**Parameters**

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary `prop`.

`update_from(other)`

copy properties from `other` to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.BrokenBarHCollection(xranges, yrange, **kwargs)
```

Bases: `matplotlib.collections.PolyCollection`

A collection of horizontal bars spanning `yrange` with a sequence of `xranges`.

**`xranges`** sequence of (`xmin`, `xwidth`)

**`yrange`** `ymin`, `ywidth`

Valid Collection keyword arguments:

- `edgecolors`: None
- `facecolors`: None
- `linewidths`: None
- `antialiaseds`: None
- `offsets`: None
- `transOffset`: `transforms.IdentityTransform()`
- `norm`: None (optional for `matplotlib.cm.ScalarMappable`)
- `cmap`: None (optional for `matplotlib.cm.ScalarMappable`)

`offsets` and `transOffset` are used to translate the patch after rendering (default no offsets)

If any of `edgecolors`, `facecolors`, `linewidths`, `antialiaseds` are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

`add_callback(func)`

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an `id` that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`  
The *Axes* instance the artist resides in, or *None*.

`changed()`  
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`  
If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`  
Test whether the mouse event occurred in the collection.  
Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`  
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

`convert_yunits(y)`  
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

`draw(renderer)`  
Derived classes drawing method

`findobj(match=None, include_self=True)`  
Find artist objects.  
Recursively find all *Artist* instances contained in self.  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., *Line2D*. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child *Artist*'s this :class:`Artist` contains.

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for *get\_linestyle*

`get_dataLim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`  
alias for *get\_edgecolor*

`get_facecolor()`

`get_facecolors(*args, **kwargs)`  
alias for *get\_facecolor*

`get_figure()`  
Return the *Figure* instance the artist belongs to.

`get_fill()`  
return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for *get\_linestyle*

`get_linewidth()`

`get_linewidths(*args, **kwargs)`  
alias for *get\_linewidth*

`get_lw(*args, **kwargs)`  
alias for *get\_linewidth*

`get_offset_position()`

Returns how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`

Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`

Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`

Return whether the artist is to be rasterized.

`get_sizes()`

Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

#### Returns

**sizes** [array] The 'area' of each element.

`get_sketch_params()`

Returns the sketch parameters for the artist.

#### Returns

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.
- **randomness**: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`

Returns the snap setting which may be:

- **True**: snap vertices to the nearest pixel center
- **False**: leave vertices as-is
- **None**: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [`RendererBase` instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

**bbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not *None*

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`

Returns *True* if Artist has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`  
Return *True* if Artist is pickable.

`properties()`  
return a dictionary mapping property name -> value for all Artist props

`remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`  
Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`  
Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`  
Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or None]

`set_animated(b)`  
Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`  
Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`  
alias for `set_antialiased`

`set_array(A)`  
Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [`'butt'`, `'round'`, `'projecting'`] The capstyle

`set_clim(vmin=None, vmax=None)`

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`

set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

`set_color(c)`

Set both the edgecolor and the facecolor.

**See also:**

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

**Parameters**

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return `hit = True` and `props` is a dictionary of properties you want returned with the contains test.

#### Parameters

**picker** [callable]

`set_dashes(*args, **kwargs)`

alias for `set_linestyle`

`set_edgecolor(c)`

Set the edgecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

#### Parameters

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`

alias for `set_edgecolor`

`set_facecolor(c)`

Set the facecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'none', the patch will not be filled.

#### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`

alias for `set_facecolor`

`set_figure(fig)`

Set the `Figure` instance the artist belongs to.

#### Parameters

**fig** [`Figure`]

`set_gid(gid)`

Sets the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(hatch)`

Set the hatching pattern

`hatch` can be one of:

```

/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`

Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`

Set the label to *s* for auto legend.

### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(ls)`

Set the linestyle(*s*) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

**ls** [{'-', '-', '-.', ':', ', (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`  
alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`  
alias for `set_linewidth`

`set_lw(*args, **kwargs)`  
alias for `set_linewidth`

`set_norm(norm)`

Set the normalization instance.

**Parameters**

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`

Set the offsets for the collection. `offsets` can be a scalar or a sequence.

**Parameters**

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`

Set the path effects.

**Parameters**

**path\_effects** [*AbstractPathEffect*]

`set_paths(verts, closed=True)`

This allows one to delay initialization of the vertices.

`set_picker(picker)`

Set the epsilon for picking used by this artist

`picker` can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist

- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_sizes(sizes, dpi=72.0)`

Set the sizes of each member of the collection.

### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float] The dpi of the canvas. Defaults to 72.0.

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If *scale* is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center

- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

### Parameters

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

### Parameters

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

### Parameters

**url** [str]

`set_urls(urls)`

### Parameters

**urls** [List[str] or None]

`set_verts(verts, closed=True)`

This allows one to delay initialization of the vertices.

`set_verts_and_codes(verts, codes)`

This allows one to initialize vertices with path codes.

`set_visible(b)`

Set the artist's visibility.

### Parameters

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

`static span_where(x, ymin, ymax, where, **kwargs)`

Create a `BrokenBarHCollection` to plot horizontal bars from over the regions in *x* where *where* is True. The bars range on the y-axis from *ymin* to *ymax*

A `BrokenBarHCollection` is returned. *kwargs* are passed on to the collection.

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

*x* and *y* sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added-the view limit "sticks" to

the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to `x`.

In the normal case, `x` is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the `norm` and `colormap` set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If `x` is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the `alpha` kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the `alpha` kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if `bytes` is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be `uint8` in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary `prop`.

`update_from(other)`

copy properties from `other` to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.CircleCollection(sizes, **kwargs)
```

Bases: `matplotlib.collections._CollectionWithSizes`

A collection of circles, drawn using splines.

`sizes` Gives the area of the circle in `points^2`

Valid Collection keyword arguments:

- `edgecolors`: None
- `facecolors`: None
- `linewidths`: None
- `antialiaseds`: None

- *offsets*: None
- *transOffset*: `transforms.IdentityTransform()`
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

*offsets* and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

`add_callback(func)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in `itemlist` contains the event.

`convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

`convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

`draw(renderer)`

Derived classes drawing method

`findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.

- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If `include_self` is `True` (default), include `self` in the list to be checked for a match.

`format_cursor_data(data)`

Return *cursor data* string formatted.

`get_agg_filter()`

Return filter function to be used for agg filter.

`get_alpha()`

Return the alpha value used for blending - not supported on all backends

`get_animated()`

Return the artist's animated state

`get_array()`

Return the array

`get_capstyle()`

`get_children()`

Return a list of the child Artist's this `:class:`Artist` contains.

`get_clim()`

return the min, max of the color limits for image scaling

`get_clip_box()`

Return artist clipbox

`get_clip_on()`

Return whether artist uses clipping

`get_clip_path()`

Return artist clip path

`get_cmap()`

return the colormap

`get_contains()`

Return the `_contains` test used by the artist, or `None` for default.

`get_cursor_data(event)`

Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`

alias for `get_linestyle`

`get_datalim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`

alias for `get_edgecolor`

`get_facecolor()`

`get_facecolors(*args, **kwargs)`

alias for `get_facecolor`

`get_figure()`

Return the *Figure* instance the artist belongs to.

`get_fill()`  
return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for *get\_linestyle*

`get_linewidth()`

`get_linewidths(*args, **kwargs)`  
alias for *get\_linewidth*

`get_lw(*args, **kwargs)`  
alias for *get\_linewidth*

`get_offset_position()`  
Returns how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`  
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`  
Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_sizes()`  
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

### Returns

**sizes** [array] The 'area' of each element.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

### Returns

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`  
Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

**bbox** [`BboxBase`] containing the bounding box (in figure pixel coordinates).

`get_transform()`  
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`  
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`  
Returns the url.

`get_urls()`

`get_visible()`  
Return the artist's visibility

`get_window_extent(renderer)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is

done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not `None`

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`

Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`

Return *True* if *Artist* is pickable.

`properties()`

return a dictionary mapping property name -> value for all *Artist* props

`remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or None]

`set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`

alias for *set\_antialiased*

`set_array(A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- *None*, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | *None*]

`set_cmap(cmap)`

set the colormap for luminance data

### Parameters

**cmap** [colormap or registered colormap name]

`set_color(c)`

Set both the edgecolor and the facecolor.

### See also:

[`set\_facecolor\(\)`](#), [`set\_edgecolor\(\)`](#) For setting the edge or face color individually.

### Parameters

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

### Parameters

**picker** [callable]

`set_dashes(*args, **kwargs)`

alias for [`set\_linestyle`](#)

`set_edgecolor(c)`

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

### Parameters

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`

alias for [`set\_edgecolor`](#)

`set_facecolor(c)`

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`

alias for `set_facecolor`

`set_figure(fig)`

Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(gid)`

Sets the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(hatch)`

Set the hatching pattern

*hatch* can be one of:

```

/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{"'", '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*}]]

`set_in_layout(in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`  
Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

**Parameters**

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`  
Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(ls)`  
Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

**ls** [{'-', '-', '-.', ':', ', ', (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`  
alias for `set_linestyle`

`set_linewidth(lw)`  
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`  
alias for `set_linewidth`

`set_lw(*args, **kwargs)`  
alias for `set_linewidth`

`set_norm(norm)`  
Set the normalization instance.

**Parameters**

**norm** [*Normalize*]

`set_offset_position(offset_position)`  
Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters****offset\_position** [{'screen', 'data'}]`set_offsets(offsets)`Set the offsets for the collection. *offsets* can be a scalar or a sequence.**Parameters****offsets** [float or sequence of floats]`set_path_effects(path_effects)`

Set the path effects.

**Parameters****path\_effects** [*AbstractPathEffect*]`set_paths()``set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the `PickEvent` attributes.

**Parameters****picker** [None or bool or float or callable]`set_pickradius(pr)`

Set the pick radius used for containment tests.

**Parameters****d** [float] Pick radius, in points.`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to *None*, which implies the backend's default behavior.**Parameters****rasterized** [bool or None]

`set_sizes(sizes, dpi=72.0)`

Set the sizes of each member of the collection.

**Parameters**

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float] The dpi of the canvas. Defaults to 72.0.

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

**Parameters**

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

**Parameters**

**url** [str]

`set_urls(urls)`

**Parameters**

**urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

**Parameters**

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the `norm` and `colormap` set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the `alpha` kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the `alpha` kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if `bytes` is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be `uint8` in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary *prop*.

`update_from(other)`

copy properties from *other* to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.Collection(edgecolors=None, facecolors=None,
                                       linewidths=None,   linestyle='solid',
                                       capstyle=None,    joinstyle=None,   anti-
                                       aliaseds=None,   offsets=None,   transOff-
                                       set=None, norm=None, cmap=None, pick-
                                       radius=5.0, hatch=None, urls=None, off-
                                       set_position='screen', zorder=1, **kwargs)
```

Bases: *matplotlib.artist.Artist, matplotlib.cm.ScalarMappable*

Base class for Collections. Must be subclassed to be usable.

All properties in a collection must be sequences or scalars; if scalars, they will be converted to sequences. The property of the *i*th element of the collection is:

```
prop[i % len(props)]
```

Exceptions are *capstyle* and *joinstyle* properties, these can only be set globally for the whole collection.

Keyword arguments and default values:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *capstyle*: None
- *joinstyle*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: `transforms.IdentityTransform()`
- *offset\_position*: 'screen' (default) or 'data'
- *norm*: None (optional for *matplotlib.cm.ScalarMappable*)
- *cmap*: None (optional for *matplotlib.cm.ScalarMappable*)
- *hatch*: None
- *zorder*: 1

*offsets* and *transOffset* are used to translate the patch after rendering (default no offsets). If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their *matplotlib.rcParams* patch setting, in sequence form.

The use of *ScalarMappable* is optional. If the *ScalarMappable* matrix *\_A* is not None (i.e., a call to `set_array` has been made), at draw time a call to scalar mappable will be made to set the face colors.

Create a Collection

```
%(Collection)s
```

`add_callback(func)`  
 Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`  
 Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`  
 Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`  
 Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`  
 The *Axes* instance the artist resides in, or *None*.

`changed()`  
 Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`  
 If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`  
 Test whether the mouse event occurred in the collection.

Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`  
 For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`  
 For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

`draw(renderer)`  
 Derived classes drawing method

`findobj(match=None, include_self=True)`  
 Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
 Return *cursor data* string formatted.

`get_agg_filter()`  
 Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child Artist's this :class:`Artist` contains.

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_contains()`  
Return the `_contains` test used by the artist, or `None` for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for `get_linestyle`

`get_datalim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`  
alias for `get_edgecolor`

`get_facecolor()`

`get_facecolors(*args, **kwargs)`  
alias for `get_facecolor`

`get_figure()`  
Return the `Figure` instance the artist belongs to.

`get_fill()`  
return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle()`

`get_label()`

Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`

alias for `get_linestyle`

`get_linewidth()`

`get_linewidths(*args, **kwargs)`

alias for `get_linewidth`

`get_lw(*args, **kwargs)`

alias for `get_linewidth`

`get_offset_position()`

Returns how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`

Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`

Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`

Return whether the artist is to be rasterized.

`get_sketch_params()`

Returns the sketch parameters for the artist.

### Returns

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`

Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is

- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

**bbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not *None*

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`  
Returns *True* if Artist has a transform explicitly set.

`mouseover`

`pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`  
Process pick event  
each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`  
Return *True* if Artist is pickable.

`properties()`  
return a dictionary mapping property name -> value for all Artist props

`remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.  
Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.  
Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`  
Remove a callback based on its *id*.

**See also:**  
`add_callback()` For adding callbacks

`set(**kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`  
Set the agg filter.

**Parameters**  
**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`  
Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**  
**alpha** [float or None]

`set_animated(b)`  
Set the artist's animation state.

**Parameters**  
**b** [bool]

`set_antialiased(aa)`  
Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`  
alias for `set_antialiased`

`set_array(A)`  
Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`  
Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`  
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(b)`  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(path, transform=None)`  
Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`  
set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

`set_color(c)`  
Set both the edgecolor and the facecolor.

**See also:**

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

**Parameters**

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`  
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return `hit = True` and `props` is a dictionary of properties you want returned with the contains test.

**Parameters**

**picker** [callable]

`set_dashes(*args, **kwargs)`  
alias for `set_linestyle`

`set_edgecolor(c)`  
Set the edgecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

**Parameters**

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`  
Set the facecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'none', the patch will not be filled.

**Parameters**

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
alias for `set_facecolor`

`set_figure(fig)`  
Set the `Figure` instance the artist belongs to.

**Parameters**

**fig** [`Figure`]

`set_gid(gid)`  
Sets the (group) id for the artist.

**Parameters**

**gid** [str]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`  
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

**Parameters**

**in\_layout** [bool]

`set_joinstyle(js)`  
Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

**Parameters**

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`  
Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling *str*.

`set_linestyle(ls)`  
Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [{'-', '-', '-.', ':', ''}, (offset, on-off-seq), ...] The line style.

`set_linestyles(*args, **kwargs)`  
alias for `set_linestyle`

`set_linewidth(lw)`  
Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`  
alias for `set_linewidth`

`set_lw(*args, **kwargs)`  
alias for `set_linewidth`

`set_norm(norm)`  
Set the normalization instance.

### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`  
Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`  
Set the offsets for the collection. `offsets` can be a scalar or a sequence.

### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`  
Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths()`

`set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the `PickEvent` attributes.

#### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to *None*, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or *None*]

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If *scale* is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

#### Parameters

**url** [str]

`set_urls(urls)`

#### Parameters

**urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added-the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the *norm* and *colormap* set for this *ScalarMappable*.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a *ValueError* will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A *ValueError* will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary *prop*.

`update_from(other)`

copy properties from *other* to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.EllipseCollection(widths, heights, angles, units='points',
                                             **kwargs)
```

Bases: `matplotlib.collections.Collection`

A collection of ellipses, drawn using splines.

### Parameters

**widths** [array-like] The lengths of the first axes (e.g., major axis lengths).

**heights** [array-like] The lengths of second axes.

**angles** [array-like] The angles of the first axes, degrees CCW from the x-axis.

**units** [{'points', 'inches', 'dots', 'width', 'height', 'x', 'y', 'xy'}] The units in which majors and minors are given; 'width' and 'height' refer to the dimensions of the axes, while 'x' and 'y' refer to the *offsets* data units. 'xy' differs from all others in that the angle as plotted varies with the aspect ratio, and equals the specified angle only when the aspect ratio is unity. Hence it behaves the same as the *Ellipse* with `axes.transData` as its transform.

## Other Parameters

**\*\*kwargs** Additional kwargs inherited from the base *Collection*.

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: `transforms.IdentityTransform()`
- *norm*: None (optional for *matplotlib.cm.ScalarMappable*)
- *cmap*: None (optional for *matplotlib.cm.ScalarMappable*)

*offsets* and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their *matplotlib.rcParams* patch setting, in sequence form.

`add_callback(func)`

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in `itemlist` contains the event.

`convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

`convert_yunits(y)`  
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

`draw(renderer)`  
Derived classes drawing method

`findobj(match=None, include_self=True)`  
Find artist objects.  
Recursively find all *Artist* instances contained in self.  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child `Artist`'s this `:class:`Artist` contains.

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for `get_linestyle`

`get_datalim(transData)`

```

get_edgecolor()
get_edgecolors(*args, **kwargs)
    alias for get_edgecolor
get_facecolor()
get_facecolors(*args, **kwargs)
    alias for get_facecolor
get_figure()
    Return the Figure instance the artist belongs to.
get_fill()
    return whether fill is set
get_gid()
    Returns the group id.
get_hatch()
    Return the current hatching pattern.
get_in_layout()
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').
get_joinstyle()
get_label()
    Get the label used for this artist in the legend.
get_linestyle()
get_linestyles(*args, **kwargs)
    alias for get_linestyle
get_linewidth()
get_linewidths(*args, **kwargs)
    alias for get_linewidth
get_lw(*args, **kwargs)
    alias for get_linewidth
get_offset_position()
    Returns how offsets are applied for the collection. If offset_position is 'screen', the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is 'data', the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.
get_offset_transform()
get_offsets()
    Return the offsets for the collection.
get_path_effects()
get_paths()
get_picker()
    Return the picker object used by this artist.
get_pickradius()

```

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

#### Returns

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`  
Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [`RendererBase` instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

**bbbox** [`BboxBase`] containing the bounding box (in figure pixel coordinates).

`get_transform()`  
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`  
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`  
Returns the url.

`get_urls()`

`get_visible()`  
Return the artist's visibility

`get_window_extent(renderer)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not `None`

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`

Returns *True* if Artist has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`

Return *True* if Artist is pickable.

`properties()`

return a dictionary mapping property name -> value for all Artist props

`remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`  
Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`  
Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or *None*]

`set_animated(b)`  
Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`  
Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`  
alias for `set_antialiased`

`set_array(A)`  
Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`  
Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`  
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(b)`  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters****b** [bool]`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- `None`, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | `None`]`set_cmap(cmap)`

set the colormap for luminance data

**Parameters****cmap** [colormap or registered colormap name]`set_color(c)`

Set both the edgecolor and the facecolor.

**See also:***set\_facecolor()*, *set\_edgecolor()* For setting the edge or face color individually.**Parameters****c** [matplotlib color arg or sequence of rgba tuples]`set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return `hit = True` and `props` is a dictionary of properties you want returned with the contains test.

**Parameters****picker** [callable]`set_dashes(*args, **kwargs)`alias for *set\_linestyle*`set_edgecolor(c)`

Set the edgecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

**Parameters****c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
alias for `set_facecolor`

`set_figure(fig)`

Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(gid)`

Sets the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(hatch)`

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`

Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

**Parameters**

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`

Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

**ls** [{'-', '-', '-.', ':', ', ', (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`

alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`

alias for `set_linewidth`

`set_lw(*args, **kwargs)`

alias for `set_linewidth`

`set_norm(norm)`

Set the normalization instance.

**Parameters**

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied

after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

#### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`

Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths()`

`set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the `PickEvent` attributes.

#### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to *None*, which implies the backend's default behavior.

**Parameters****rasterized** [bool or None]

`set_sketch_params(scale=None, length=None, randomness=None)`  
 Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**Parameters****snap** [bool or None]

`set_transform(t)`

Set the artist transform.

**Parameters****t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

**Parameters****url** [str]

`set_urls(urls)`

**Parameters****urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

**Parameters****b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level** [float]

**stale**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**sticky\_edges**

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to\_rgba(x, alpha=None, bytes=False, norm=True)**

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update(props)**

Update this artist's properties from the dictionary *prop*.

**update\_from(other)**

copy properties from other to self

**update\_scalarmappable()**

If the scalar mappable array is not none, update colors from scalar data

**zorder** = 0

```
class matplotlib.collections.EventCollection(positions, orientation=None, lineoff-
                                             set=0, linelength=1, linewidth=None,
                                             color=None, linestyle='solid', an-
                                             tialiased=None, **kwargs)
```

Bases: *matplotlib.collections.LineCollection*

A collection of discrete events.

The events are given by a 1-dimensional array, usually the position of something along an axis, such as time or length. They do not have an amplitude and are displayed as vertical or horizontal parallel bars.

### Parameters

**positions** [1D array-like object] Each value is an event.

**orientation** [{None, 'horizontal', 'vertical'}, optional] The orientation of the **collection** (the event bars are along the orthogonal direction). Defaults to 'horizontal' if not specified or None.

**lineoffset** [scalar, optional, default: 0] The offset of the center of the markers from the origin, in the direction orthogonal to *orientation*.

**linelength** [scalar, optional, default: 1] The total height of the marker (i.e. the marker stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

**linewidth** [scalar or None, optional, default: None] If it is None, defaults to its rcParams setting, in sequence form.

**color** [color, sequence of colors or None, optional, default: None] If it is None, defaults to its rcParams setting, in sequence form.

**linestyle** [str or tuple, optional, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

`(offset, onoffseq),`

where *onoffseq* is an even length tuple of on and off ink in points.

**antialiased** [{None, 1, 2}, optional] If it is None, defaults to its rcParams setting, in sequence form.

**\*\*kwargs** [optional] Other keyword arguments are line collection properties. See *LineCollection* for a list of the valid properties.

### Examples

`add_callback(func)`

Adds a callback function that will be called whenever one of the *Artist*'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`add_positions(position)`

add one or more events at the specified positions

`aname = 'Artist'`

`append_positions(position)`

add one or more events at the specified positions

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`

Test whether the mouse event occurred in the collection.

Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

`draw(renderer)`  
Derived classes drawing method

`extend_positions(position)`  
add one or more events at the specified positions

`findobj(match=None, include_self=True)`  
Find artist objects.  
Recursively find all *Artist* instances contained in self.  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is `True` (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child `Artist`'s this `:class:`Artist` contains.

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_color()`  
get the color of the lines used to mark each event

`get_colors()`

`get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for `get_linestyle`

`get_dataLim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`  
alias for `get_edgecolor`

`get_facecolor()`

`get_facecolors(*args, **kwargs)`  
alias for `get_facecolor`

`get_figure()`  
Return the *Figure* instance the artist belongs to.

`get_fill()`  
return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linelength()`  
get the length of the lines used to mark each event

`get_lineoffset()`  
get the offset of the lines used to mark each event

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for `get_linestyle`

`get_linewidth()`  
Get the width of the lines used to mark each event.

`get_linewidths()`  
alias for `get_linewidth`

`get_lw(*args, **kwargs)`  
alias for `get_linewidth`

`get_offset_position()`  
Returns how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`  
Return the offsets for the collection.

`get_orientation()`  
get the orientation of the event line, may be: [ 'horizontal' | 'vertical' ]

`get_path_effects()`

`get_paths()`

`get_picker()`  
Return the picker object used by this artist.

`get_pickradius()`

`get_positions()`  
return an array containing the floating-point values of the positions

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_segments()`

**Returns**

**segments** [list] List of segments in the LineCollection. Each list item contains an array of vertices.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`  
Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer** [`RendererBase` instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

**bbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not *None*

Returns whether the artist is assigned to a *Figure*.

`is_horizontal()`

*True* if the eventcollection is horizontal, *False* if vertical

`is_transform_set()`

Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`  
Return *True* if Artist is pickable.

`properties()`  
return a dictionary mapping property name -> value for all Artist props

`remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`  
Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`  
Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`  
Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or None]

`set_animated(b)`  
Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`  
Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`  
alias for `set_antialiased`

`set_array(A)`  
Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`

set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

`set_color(c)`

Set the color(s) of the LineCollection.

**Parameters**

**c** : Matplotlib color argument (all patches have same color), or a sequence or rgba tuples; if it is a sequence the patches will cycle through the sequence.

`set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

### Parameters

**picker** [callable]

`set_dashes(*args, **kwargs)`  
alias for `set_linestyle`

`set_edgecolor(c)`  
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

### Parameters

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`  
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
alias for `set_facecolor`

`set_figure(fig)`  
Set the *Figure* instance the artist belongs to.

### Parameters

**fig** [*Figure*]

`set_gid(gid)`  
Sets the (group) id for the artist.

### Parameters

**gid** [str]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
```

(continues on next page)

(continued from previous page)

```

+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [`{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}`]

`set_in_layout(in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`

Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

### Parameters

**js** [`{'miter', 'round', 'bevel'}`] The joinstyle

`set_label(s)`

Set the label to *s* for auto legend.

### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linelength(linelength)`

set the length of the lines used to mark each event

`set_lineoffset(lineoffset)`

set the offset of the lines used to mark each event

`set_linestyle(ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [`'-'`, `'-'`, `'-.'`, `':'`, `''`, (offset, on-off-seq), ...] The line style.

`set_linestyles(*args, **kwargs)`

alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`

alias for `set_linewidth`

`set_lw(*args, **kwargs)`

alias for `set_linewidth`

`set_norm(norm)`

Set the normalization instance.

### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If `offset_position` is `'screen'` (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is `'data'`, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [`'screen'`, `'data'`]

`set_offsets(offsets)`

Set the offsets for the collection. `offsets` can be a scalar or a sequence.

### Parameters

**offsets** [float or sequence of floats]

`set_orientation(orientation=None)`

set the orientation of the event line [ `'horizontal'` | `'vertical'` | `None` ] defaults to `'horizontal'` if not specified or `None`

`set_path_effects(path_effects)`

Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(segments)`

`set_picker(picker)`

Set the epsilon for picking used by this artist

`picker` can be one of the following:

- `None`: picking is disabled for this artist (default)

- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_positions(positions)`

set the positions of the events to the specified value

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_segments(segments)`

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is

- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

### Parameters

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

### Parameters

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

### Parameters

**url** [str]

`set_urls(urls)`

### Parameters

**urls** [List[str] or None]

`set_verts(segments)`

`set_visible(b)`

Set the artist's visibility.

### Parameters

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added-the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`switch_orientation()`  
 switch the orientation of the event line, either from vertical to horizontal or vice versus

`to_rgba(x, alpha=None, bytes=False, norm=True)`  
 Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the *norm* and *colormap* set for this *ScalarMappable*.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be `uint8` in the 0 to 255 range.

If *norm* is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`  
 Update this artist's properties from the dictionary *prop*.

`update_from(other)`  
 copy properties from other to self

`update_scalarmappable()`  
 If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.LineCollection(segments, linewidths=None, col-
                                           ors=None, antialiaseds=None,
                                           linestyles='solid', offsets=None, tran-
                                           sOffset=None, norm=None, cmap=None,
                                           pickradius=5, zorder=2, facecol-
                                           ors='none', **kwargs)
```

Bases: `matplotlib.collections.Collection`

All parameters must be sequences or scalars; if scalars, they will be converted to sequences. The property of the *i*th line segment is:

```
prop[i % len(props)]
```

i.e., the properties cycle if the `len` of *props* is less than the number of segments.

### Parameters

**segments** : A sequence of (*line0*, *line1*, *line2*), where:

```
linen = (x0, y0), (x1, y1), ... (xm, ym)
```

or the equivalent numpy array with two columns. Each line can be a different length.

**colors** [sequence, optional] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

**antialiaseds** [sequence, optional] A sequence of ones or zeros.

**linestyles** [string, tuple, optional] Either one of [ 'solid' | 'dashed' | 'dash-dot' | 'dotted' ], or a dash tuple. The dash tuple is:

```
(offset, onoffseq)
```

where *onoffseq* is an even length tuple of on and off ink in points.

**norm** [Normalize, optional] *Normalize* instance.

**cmap** [string or Colormap, optional] Colormap name or *Colormap* instance.

**pickradius** [float, optional] The tolerance in points for mouse clicks picking a line. Default is 5 pt.

**zorder** [int, optional] zorder of the LineCollection. Default is 2.

**facecolors** [optional] The facecolors of the LineCollection. Default is 'none'. Setting to a value other than 'none' will lead to a filled polygon being drawn between points on each line.

## Notes

If *linewidths*, *colors*, or *antialiaseds* is None, they default to their rcParams setting, in sequence form.

If *offsets* and *transOffset* are not None, then *offsets* are transformed by *transOffset* and applied after the segments have been transformed to display coordinates.

If *offsets* is not None but *transOffset* is None, then the *offsets* are added to the segments before any transformation. In this case, a single offset can be specified as:

```
offsets=(xo,yo)
```

and this value will be added cumulatively to each successive segment, so as to produce a set of successively offset curves.

The use of *ScalarMappable* is optional. If the *ScalarMappable* array *\_A* is not None (i.e., a call to *set\_array()* has been made), at draw time a call to scalar mappable will be made to set the colors.

`add_callback(func)`

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with *remove\_callback()* later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`  
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`  
The *Axes* instance the artist resides in, or *None*.

`changed()`  
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`  
If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`  
Test whether the mouse event occurred in the collection.  
  
Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`  
For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`  
For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

`draw(renderer)`  
Derived classes drawing method

`findobj(match=None, include_self=True)`  
Find artist objects.  
  
Recursively find all *Artist* instances contained in self.  
  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child Artist's this :class:`Artist` contains.

---

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_color()`

`get_colors()`

`get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for *get\_linestyle*

`get_dataLim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`  
alias for *get\_edgecolor*

`get_facecolor()`

`get_facecolors(*args, **kwargs)`  
alias for *get\_facecolor*

`get_figure()`  
Return the *Figure* instance the artist belongs to.

`get_fill()`  
return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for `get_linestyle`

`get_linewidth()`

`get_linewidths(*args, **kwargs)`  
alias for `get_linewidth`

`get_lw(*args, **kwargs)`  
alias for `get_linewidth`

`get_offset_position()`

Returns how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`  
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`  
Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_segments()`

### Returns

**segments** [list] List of segments in the LineCollection. Each list item contains an array of vertices.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

### Returns

**sketch\_params** [tuple or None] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [*RendererBase* instance] *renderer* that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

**bbbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not *None*

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`

Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`

Return *True* if Artist is pickable.

`properties()`

return a dictionary mapping property name -> value for all Artist props

`remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or None]

`set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`  
alias for `set_antialiased`

`set_array(A)`  
Set the image array from numpy array *A*.

#### Parameters

**A** [ndarray]

`set_capstyle(cs)`  
Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

#### Parameters

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`  
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(b)`  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

#### Parameters

**b** [bool]

`set_clip_path(path, transform=None)`  
Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`  
set the colormap for luminance data

#### Parameters

**cmap** [colormap or registered colormap name]

`set_color(c)`  
Set the color(s) of the LineCollection.

**Parameters**

**c** : Matplotlib color argument (all patches have same color), or a sequence or rgba tuples; if it is a sequence the patches will cycle through the sequence.

`set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return `hit = True` and `props` is a dictionary of properties you want returned with the contains test.

**Parameters**

**picker** [callable]

`set_dashes(*args, **kwargs)`

alias for `set_linestyle`

`set_edgecolor(c)`

Set the edgecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

**Parameters**

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`

alias for `set_edgecolor`

`set_facecolor(c)`

Set the facecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'none', the patch will not be filled.

**Parameters**

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`

alias for `set_facecolor`

`set_figure(fig)`

Set the `Figure` instance the artist belongs to.

**Parameters**

**fig** [`Figure`]

`set_gid(gid)`

Sets the (group) id for the artist.

**Parameters**

**gid** [str]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`

Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

#### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`

Set the label to *s* for auto legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(ls)`

Set the linestyle(*s*) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of `on` and `off` ink in points.

### Parameters

**ls** [`'-'`, `'-'`, `'-.'`, `':'`, `''`, (offset, on-off-seq), ...] The line style.

`set_linestyles(*args, **kwargs)`  
alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`  
alias for `set_linewidth`

`set_lw(*args, **kwargs)`  
alias for `set_linewidth`

`set_norm(norm)`

Set the normalization instance.

### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If `offset_position` is `'screen'` (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is `'data'`, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [`'screen'`, `'data'`]

`set_offsets(offsets)`

Set the offsets for the collection. `offsets` can be a scalar or a sequence.

### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`

Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(segments)`

`set_picker(picker)`

Set the epsilon for picking used by this artist

`picker` can be one of the following:

- `None`: picking is disabled for this artist (default)

- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_segments(segments)`

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

### Parameters

**snap** [bool or None]

`set_transform(t)`  
Set the artist transform.

### Parameters

**t** [*Transform*]

`set_url(url)`  
Sets the url for the artist.

### Parameters

**url** [str]

`set_urls(urls)`

### Parameters

**urls** [List[str] or None]

`set_verts(segments)`

`set_visible(b)`  
Set the artist's visibility.

### Parameters

**b** [bool]

`set_zorder(level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

`stale`  
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`  
x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the *norm* and *colormap* set for this *ScalarMappable*.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be `uint8` in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary *prop*.

`update_from(other)`

copy properties from *other* to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.PatchCollection(patches,          match_original=False,
                                             **kwargs)
```

Bases: `matplotlib.collections.Collection`

A generic collection of patches.

This makes it easier to assign a color map to a heterogeneous collection of patches.

This also may improve plotting speed, since `PatchCollection` will draw faster than a large number of patches.

***patches*** a sequence of `Patch` objects. This list may include a heterogeneous assortment of different patch types.

***match\_original*** If *True*, use the colors and linewidths of the original patches. If *False*, new colors may be assigned by providing the standard collection arguments, *facecolor*, *edgecolor*, *linewidths*, *norm* or *cmap*.

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are *None*, they default to their `matplotlib.rcParams` patch setting, in sequence form.

The use of *ScalarMappable* is optional. If the *ScalarMappable* matrix *\_A* is not *None* (i.e., a call to `set_array` has been made), at draw time a call to scalar mappable will be made to set the face colors.

`add_callback(func)`

Adds a callback function that will be called whenever one of the *Artist*'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`  
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`  
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`  
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`  
The *Axes* instance the artist resides in, or *None*.

`changed()`  
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`  
If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`  
Test whether the mouse event occurred in the collection.  
  
Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`  
For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`  
For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

`draw(renderer)`  
Derived classes drawing method

`findobj(match=None, include_self=True)`  
Find artist objects.  
  
Recursively find all *Artist* instances contained in self.  
  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., *Line2D*. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

---

```

get_animated()
    Return the artist's animated state

get_array()
    Return the array

get_capstyle()

get_children()
    Return a list of the child Artist's this :class:`Artist` contains.

get_clim()
    return the min, max of the color limits for image scaling

get_clip_box()
    Return artist clipbox

get_clip_on()
    Return whether artist uses clipping

get_clip_path()
    Return artist clip path

get_cmap()
    return the colormap

get_contains()
    Return the _contains test used by the artist, or None for default.

get_cursor_data(event)
    Get the cursor data for a given event.

get_dashes(*args, **kwargs)
    alias for get_linestyle

get_dataLim(transData)

get_edgecolor()

get_edgecolors(*args, **kwargs)
    alias for get_edgecolor

get_facecolor()

get_facecolors(*args, **kwargs)
    alias for get_facecolor

get_figure()
    Return the Figure instance the artist belongs to.

get_fill()
    return whether fill is set

get_gid()
    Returns the group id.

get_hatch()
    Return the current hatching pattern.

get_in_layout()
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').

```

`get_joinstyle()`

`get_label()`

Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`

alias for `get_linestyle`

`get_linewidth()`

`get_linewidths(*args, **kwargs)`

alias for `get_linewidth`

`get_lw(*args, **kwargs)`

alias for `get_linewidth`

`get_offset_position()`

Returns how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`

Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`

Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`

Return whether the artist is to be rasterized.

`get_sketch_params()`

Returns the sketch parameters for the artist.

### Returns

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`

Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [*RendererBase* instance] *renderer* that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

**bbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not *None*

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`

Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`

Return *True* if Artist is pickable.

`properties()`

return a dictionary mapping property name -> value for all Artist props

`remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or None]

`set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`  
alias for `set_antialiased`

`set_array(A)`  
Set the image array from numpy array *A*.

#### Parameters

**A** [ndarray]

`set_capstyle(cs)`  
Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

#### Parameters

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`  
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(b)`  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

#### Parameters

**b** [bool]

`set_clip_path(path, transform=None)`  
Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`  
set the colormap for luminance data

#### Parameters

**cmap** [colormap or registered colormap name]

`set_color(c)`  
Set both the edgecolor and the facecolor.

**See also:**

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

**Parameters**

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`  
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return `hit = True` and `props` is a dictionary of properties you want returned with the contains test.

**Parameters**

**picker** [callable]

`set_dashes(*args, **kwargs)`  
alias for `set_linestyle`

`set_edgecolor(c)`  
Set the edgecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

**Parameters**

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`  
Set the facecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is 'none', the patch will not be filled.

**Parameters**

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
alias for `set_facecolor`

`set_figure(fig)`  
Set the `Figure` instance the artist belongs to.

**Parameters**

**fig** [`Figure`]

`set_gid(gid)`  
Sets the (group) id for the artist.

**Parameters**

**gid** [str]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

```

/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`  
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

**Parameters**

**in\_layout** [bool]

`set_joinstyle(js)`  
Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

**Parameters**

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`  
Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling *str*.

`set_linestyle(ls)`  
Set the linestyle(*s*) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [{'-', '-', '-.', ':', ', ', (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`  
alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`  
alias for `set_linewidth`

`set_lw(*args, **kwargs)`  
alias for `set_linewidth`

`set_norm(norm)`  
Set the normalization instance.

### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`  
Set the offsets for the collection. `offsets` can be a scalar or a sequence.

### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`  
Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(patches)`

`set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

#### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If *scale* is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

#### Parameters

**url** [str]

`set_urls(urls)`

#### Parameters

**urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added-the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the *norm* and *colormap* set for this *ScalarMappable*.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a *ValueError* will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A *ValueError* will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary *prop*.

`update_from(other)`

copy properties from *other* to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.PathCollection(paths, sizes=None, **kwargs)
```

Bases: `matplotlib.collections._CollectionWithSizes`

This is the most basic *Collection* subclass.

*paths* is a sequence of `matplotlib.path.Path` instances.

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: `transforms.IdentityTransform()`
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

*offsets* and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

`add_callback(func)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`

Test whether the mouse event occurred in the collection.

Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

`draw(renderer)`

Derived classes drawing method

`findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

---

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child Artist's this :class:`Artist` contains.

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for `get_linestyle`

`get_datalim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`  
alias for `get_edgecolor`

`get_facecolor()`

`get_facecolors(*args, **kwargs)`  
alias for `get_facecolor`

`get_figure()`  
Return the *Figure* instance the artist belongs to.

`get_fill()`  
return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for *get\_linestyle*

`get_linewidth()`

`get_linewidths(*args, **kwargs)`  
alias for *get\_linewidth*

`get_lw(*args, **kwargs)`  
alias for *get\_linewidth*

`get_offset_position()`  
Returns how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`  
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`  
Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_sizes()`  
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

**Returns**

**sizes** [array] The 'area' of each element.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or None] A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.

- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`

Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

**bbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return `True` if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The `hitlist` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not `None`

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`

Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`

Return *True* if *Artist* is pickable.

`properties()`

return a dictionary mapping property name -> value for all *Artist* props

`remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

#### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

#### Parameters

**alpha** [float or None]

`set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`

alias for `set_antialiased`

`set_array(A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | `None`]

`set_cmap(cmap)`  
set the colormap for luminance data

#### Parameters

**cmap** [colormap or registered colormap name]

`set_color(c)`  
Set both the edgecolor and the facecolor.

#### See also:

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

#### Parameters

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`  
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return `hit = True` and `props` is a dictionary of properties you want returned with the contains test.

#### Parameters

**picker** [callable]

`set_dashes(*args, **kwargs)`  
alias for `set_linestyle`

`set_edgecolor(c)`  
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

#### Parameters

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`  
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
alias for `set_facecolor`

`set_figure(fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(gid)`  
Sets the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

```

/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`  
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`  
Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

#### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`  
Set the label to *s* for auto legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [{"-'", '-.', '-:', ':', "", (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`

alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`

alias for `set_linewidth`

`set_lw(*args, **kwargs)`

alias for `set_linewidth`

`set_norm(norm)`

Set the normalization instance.

### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`  
Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(paths)`

`set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the `PickEvent` attributes.

#### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to *None*, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_sizes(sizes, dpi=72.0)`

Set the sizes of each member of the collection.

#### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float] The dpi of the canvas. Defaults to 72.0.

`set_sketch_params(scale=None, length=None, randomness=None)`  
Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

**Parameters**

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

**Parameters**

**url** [str]

`set_urls(urls)`

**Parameters**

**urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

**Parameters**

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

**stale**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**sticky\_edges**

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to\_rgba(x, alpha=None, bytes=False, norm=True)**

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update(props)**

Update this artist's properties from the dictionary *prop*.

**update\_from(other)**

copy properties from other to self

**update\_scalarmappable()**

If the scalar mappable array is not none, update colors from scalar data

zorder = 0

```
class matplotlib.collections.PolyCollection(verts, sizes=None, closed=True,
                                           **kwargs)
    Bases: matplotlib.collections._CollectionWithSizes
```

*verts* is a sequence of (*verts0*, *verts1*, ...) where *verts<sub>i</sub>* is a sequence of xy tuples of vertices, or an equivalent `numpy` array of shape (*nv*, 2).

*sizes* is *None* (default) or a sequence of floats that scale the corresponding *verts<sub>i</sub>*. The scaling is applied before the Artist master transform; if the latter is an identity transform, then the overall scaling is such that if *verts<sub>i</sub>* specify a unit square, then *sizes<sub>i</sub>* is the area of that square in points<sup>2</sup>. If `len(sizes) < nv`, the additional values will be taken cyclically from the array.

*closed*, when *True*, will explicitly close the polygon.

Valid Collection keyword arguments:

- *edgecolors*: *None*
- *facecolors*: *None*
- *linewidths*: *None*
- *antialiaseds*: *None*
- *offsets*: *None*
- *transOffset*: `transforms.IdentityTransform()`
- *norm*: *None* (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: *None* (optional for `matplotlib.cm.ScalarMappable`)

*offsets* and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are *None*, they default to their `matplotlib.rcParams` patch setting, in sequence form.

`add_callback(func)`

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to *True* when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are *None*

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return *True*; else return *False*

`contains(mouseevent)`  
 Test whether the mouse event occurred in the collection.  
 Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`  
 For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`  
 For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

`draw(renderer)`  
 Derived classes drawing method

`findobj(match=None, include_self=True)`  
 Find artist objects.  
 Recursively find all *Artist* instances contained in self.  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
 Return *cursor data* string formatted.

`get_agg_filter()`  
 Return filter function to be used for agg filter.

`get_alpha()`  
 Return the alpha value used for blending - not supported on all backends

`get_animated()`  
 Return the artist's animated state

`get_array()`  
 Return the array

`get_capstyle()`

`get_children()`  
 Return a list of the child `Artist`'s this `:class:`Artist` contains.

`get_clim()`  
 return the min, max of the color limits for image scaling

`get_clip_box()`  
 Return artist clipbox

`get_clip_on()`  
 Return whether artist uses clipping

`get_clip_path()`  
 Return artist clip path

`get_cmap()`  
 return the colormap

`get_contains()`  
Return the `_contains` test used by the artist, or `None` for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for `get_linestyle`

`get_dataLim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`  
alias for `get_edgecolor`

`get_facecolor()`

`get_facecolors(*args, **kwargs)`  
alias for `get_facecolor`

`get_figure()`  
Return the `Figure` instance the artist belongs to.

`get_fill()`  
return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
  
E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for `get_linestyle`

`get_linewidth()`

`get_linewidths(*args, **kwargs)`  
alias for `get_linewidth`

`get_lw(*args, **kwargs)`  
alias for `get_linewidth`

`get_offset_position()`  
Returns how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`  
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`  
Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_sizes()`  
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

**Returns**

**sizes** [array] The 'area' of each element.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`  
Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`  
Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer** [`RendererBase` instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

**bbox** [`BboxBase`] containing the bounding box (in figure pixel coordinates).

`get_transform()`  
Return the `Transform` instance used by this artist.

`get_transformed_clip_path_and_affine()`  
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`  
Returns the url.

`get_urls()`

`get_visible()`  
Return the artist's visibility

`get_window_extent(renderer)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`  
Return the artist's zorder.

`have_units()`  
Return *True* if units are set on the x or y axes

`hitlist(event)`  
Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`  
Deprecated since version 2.2: `artist.figure` is not `None`

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`  
Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`  
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`  
Return *True* if *Artist* is pickable.

`properties()`  
return a dictionary mapping property name -> value for all *Artist* props

`remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the

figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or None]

`set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`

alias for `set_antialiased`

`set_array(A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

#### Parameters

**b** [bool]

`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`

set the colormap for luminance data

#### Parameters

**cmap** [colormap or registered colormap name]

`set_color(c)`

Set both the edgecolor and the facecolor.

#### See also:

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

#### Parameters

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

### Parameters

**picker** [callable]

`set_dashes(*args, **kwargs)`  
alias for `set_linestyle`

`set_edgecolor(c)`  
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

### Parameters

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`  
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
alias for `set_facecolor`

`set_figure(fig)`  
Set the *Figure* instance the artist belongs to.

### Parameters

**fig** [*Figure*]

`set_gid(gid)`  
Sets the (group) id for the artist.

### Parameters

**gid** [str]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal

(continues on next page)

(continued from previous page)

```

o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`

Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`

Set the label to `s` for auto legend.

### Parameters

**s** [object] `s` will be converted to a string by calling `str`.

`set_linestyle(ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [{'-', '-.', '-:', ':', ':', (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`

alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`

alias for `set_linewidth`

`set_lw(*args, **kwargs)`

alias for `set_linewidth`

`set_norm(norm)`

Set the normalization instance.

#### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

#### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`

Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(verts, closed=True)`

This allows one to delay initialization of the vertices.

`set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

- A function: if `picker` is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return `hit=True` and `props` is a dictionary of properties you want added to the `PickEvent` attributes.

### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_sizes(sizes, dpi=72.0)`

Set the sizes of each member of the collection.

### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float] The dpi of the canvas. Defaults to 72.0.

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If `scale` is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**Parameters****snap** [bool or None]

`set_transform(t)`  
Set the artist transform.

**Parameters****t** [*Transform*]

`set_url(url)`  
Sets the url for the artist.

**Parameters****url** [str]

`set_urls(urls)`

**Parameters****urls** [List[str] or None]

`set_verts(verts, closed=True)`  
This allows one to delay initialization of the vertices.

`set_verts_and_codes(verts, codes)`  
This allows one to initialize vertices with path codes.

`set_visible(b)`  
Set the artist's visibility.

**Parameters****b** [bool]

`set_zorder(level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level** [float]

**stale**  
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**sticky\_edges**  
x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`  
 Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be `uint8` in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`  
 Update this artist's properties from the dictionary *prop*.

`update_from(other)`  
 copy properties from other to self

`update_scalarmappable()`  
 If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

`class matplotlib.collections.QuadMesh(meshWidth, meshHeight, coordinates, antialiased=True, shading='flat', **kwargs)`

Bases: `matplotlib.collections.Collection`

Class for the efficient drawing of a quadrilateral mesh.

A quadrilateral mesh consists of a grid of vertices. The dimensions of this array are  $(meshWidth + 1, meshHeight + 1)$ . Each vertex in the mesh has a different set of "mesh coordinates" representing its position in the topology of the mesh. For any values  $(m, n)$  such that  $0 \leq m \leq meshWidth$  and  $0 \leq n \leq meshHeight$ , the vertices at mesh coordinates  $(m, n)$ ,  $(m, n + 1)$ ,  $(m + 1, n + 1)$ , and  $(m + 1, n)$  form one of the quadrilaterals in the mesh. There are thus  $(meshWidth * meshHeight)$  quadrilaterals in the mesh. The mesh need not be regular and the polygons need not be convex.

A quadrilateral mesh is represented by a  $(2 \times ((meshWidth + 1) * (meshHeight + 1)))$  numpy array *coordinates*, where each row is the x and y coordinates of one of the vertices. To define the function that maps from a data point to its corresponding color, use the `set_cmap()` method. Each of these arrays is indexed in row-major order by the mesh coordinates of the vertex (or the mesh coordinates of the lower left vertex, in the case of the colors).

For example, the first entry in *coordinates* is the coordinates of the vertex at mesh coordinates (0, 0), then the one at (0, 1), then at (0, 2) .. (0, meshWidth), (1, 0), (1, 1), and so on.

*shading* may be 'flat', or 'gouraud'

`add_callback(func)`  
 Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`  
 Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`  
 Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`  
 Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`  
 The *Axes* instance the artist resides in, or *None*.

`changed()`  
 Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`  
 If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`  
 Test whether the mouse event occurred in the collection.

Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`static convert_mesh_to_paths(meshWidth, meshHeight, coordinates)`  
 Converts a given mesh into a sequence of `matplotlib.path.Path` objects for easier rendering by backends that do not directly support quadmeshes.

This function is primarily of use to backend implementers.

`convert_mesh_to_triangles(meshWidth, meshHeight, coordinates)`  
 Converts a given mesh into a sequence of triangles, each point with its own color. This is useful for experiments using `draw_qouraud_triangle`.

`convert_xunits(x)`  
 For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

`convert_yunits(y)`  
 For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

`draw(renderer)`  
 Derived classes drawing method

`findobj(match=None, include_self=True)`  
 Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches

- class instance: e.g., Line2D. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`

Return *cursor data* string formatted.

`get_agg_filter()`

Return filter function to be used for agg filter.

`get_alpha()`

Return the alpha value used for blending - not supported on all backends

`get_animated()`

Return the artist's animated state

`get_array()`

Return the array

`get_capstyle()`

`get_children()`

Return a list of the child Artist's this :class:`Artist` contains.

`get_clim()`

return the min, max of the color limits for image scaling

`get_clip_box()`

Return artist clipbox

`get_clip_on()`

Return whether artist uses clipping

`get_clip_path()`

Return artist clip path

`get_cmap()`

return the colormap

`get_contains()`

Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`

Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`

alias for `get_linestyle`

`get_datalim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`

alias for `get_edgecolor`

`get_facecolor()`

`get_facecolors(*args, **kwargs)`

alias for `get_facecolor`

`get_figure()`

Return the *Figure* instance the artist belongs to.

`get_fill()`

return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for `get_linestyle`

`get_linewidth()`

`get_linewidths(*args, **kwargs)`  
alias for `get_linewidth`

`get_lw(*args, **kwargs)`  
alias for `get_linewidth`

`get_offset_position()`  
Returns how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`  
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`  
Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or None] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

**bbbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not `None`

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`

Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`

Return *True* if *Artist* is pickable.

`properties()`

return a dictionary mapping property name -> value for all *Artist* props

`remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or *None*]

`set_animated(b)`

Set the artist's animation state.

**Parameters****b** [bool]`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters****aa** [bool or sequence of bools]`set_antialiaseds(*args, **kwargs)`alias for `set_antialiased``set_array(A)`Set the image array from numpy array *A*.**Parameters****A** [ndarray]`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters****cs** [{'butt', 'round', 'projecting'}] The capstyle`set_clim(vmin=None, vmax=None)`set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.`set_clip_box(clipbox)`Set the artist's clip *Bbox*.**Parameters****clipbox** [*Bbox*]`set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters****b** [bool]`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`  
 set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

`set_color(c)`  
 Set both the edgecolor and the facecolor.

**See also:**

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

**Parameters**

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`  
 Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return `hit = True` and `props` is a dictionary of properties you want returned with the contains test.

**Parameters**

**picker** [callable]

`set_dashes(*args, **kwargs)`  
 alias for `set_linestyle`

`set_edgecolor(c)`  
 Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

**Parameters**

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
 alias for `set_edgecolor`

`set_facecolor(c)`  
 Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters**

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
 alias for `set_facecolor`

`set_figure(fig)`  
Set the *Figure* instance the artist belongs to.

**Parameters**

**fig** [*Figure*]

`set_gid(gid)`  
Sets the (group) id for the artist.

**Parameters**

**gid** [str]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`  
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

**Parameters**

**in\_layout** [bool]

`set_joinstyle(js)`  
Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

**Parameters**

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`  
Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling *str*.

`set_linestyle(ls)`  
Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

#### Parameters

**ls** [ ['- ', '- ', '-.', ':', ', ', (offset, on-off-seq), ... ] ] The line style.

`set_linestyles(*args, **kwargs)`  
alias for `set_linestyle`

`set_linewidth(lw)`  
Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`  
alias for `set_linewidth`

`set_lw(*args, **kwargs)`  
alias for `set_linewidth`

`set_norm(norm)`  
Set the normalization instance.

#### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`  
Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`  
Set the offsets for the collection. `offsets` can be a scalar or a sequence.

#### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`  
Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths()`

`set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the `PickEvent` attributes.

### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to *None*, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If *scale* is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

#### Parameters

**url** [str]

`set_urls(urls)`

#### Parameters

**urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added-the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the *norm* and *colormap* set for this *ScalarMappable*.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a *ValueError* will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A *ValueError* will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary *prop*.

`update_from(other)`

copy properties from *other* to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.RegularPolyCollection(numsides, rotation=0, sizes=(1, ),
                                                    **kwargs)
```

Bases: `matplotlib.collections._CollectionWithSizes`

Draw a collection of regular polygons with *numsides*.

***numsides*** the number of sides of the polygon

***rotation*** the rotation of the polygon in radians

***sizes*** gives the area of the circle circumscribing the regular polygon in  $\text{points}^2$

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: `transforms.IdentityTransform()`

- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

*offsets* and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

Example: see `/gallery/event_handling/lasso_demo` for a complete example:

```
offsets = np.random.rand(20,2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0,0,0,1)

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=(black,),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)
```

`add_callback(func)`

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`

Test whether the mouse event occurred in the collection.

Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`  
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

`draw(renderer)`  
Derived classes drawing method

`findobj(match=None, include_self=True)`  
Find artist objects.  
Recursively find all *Artist* instances contained in self.  
*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child `Artist`'s this `:class:`Artist` contains.

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for `get_linestyle`

`get_dataLim(transData)`

```

get_edgecolor()
get_edgecolors(*args, **kwargs)
    alias for get_edgecolor
get_facecolor()
get_facecolors(*args, **kwargs)
    alias for get_facecolor
get_figure()
    Return the Figure instance the artist belongs to.
get_fill()
    return whether fill is set
get_gid()
    Returns the group id.
get_hatch()
    Return the current hatching pattern.
get_in_layout()
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').
get_joinstyle()
get_label()
    Get the label used for this artist in the legend.
get_linestyle()
get_linestyles(*args, **kwargs)
    alias for get_linestyle
get_linewidth()
get_linewidths(*args, **kwargs)
    alias for get_linewidth
get_lw(*args, **kwargs)
    alias for get_linewidth
get_numsides()
get_offset_position()
    Returns how offsets are applied for the collection. If offset_position is 'screen', the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is 'data', the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.
get_offset_transform()
get_offsets()
    Return the offsets for the collection.
get_path_effects()
get_paths()
get_picker()
    Return the picker object used by this artist.

```

`get_pickradius()`

`get_rasterized()`

Return whether the artist is to be rasterized.

`get_rotation()`

`get_sizes()`

Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

**Returns**

**sizes** [array] The 'area' of each element.

`get_sketch_params()`

Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.
- **randomness**: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`

Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer** [`RendererBase` instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

**bbox** [`BboxBase`] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`  
Return the artist's visibility

`get_window_extent(renderer)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`  
Return the artist's zorder.

`have_units()`  
Return *True* if units are set on the x or y axes

`hitlist(event)`  
Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`  
Deprecated since version 2.2: `artist.figure` is not `None`

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`  
Returns *True* if `Artist` has a transform explicitly set.

`mouseover`

`pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`  
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`  
Return *True* if `Artist` is pickable.

`properties()`  
return a dictionary mapping property name -> value for all `Artist` props

`remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or *None*]

`set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`

alias for `set_antialiased`

`set_array(A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(b)`  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(path, transform=None)`  
Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`  
set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

`set_color(c)`  
Set both the edgecolor and the facecolor.

**See also:**

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

**Parameters**

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`  
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

**Parameters**

**picker** [callable]

`set_dashes(*args, **kwargs)`  
alias for `set_linestyle`

`set_edgecolor(c)`

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

#### Parameters

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`

alias for `set_edgecolor`

`set_facecolor(c)`

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`

alias for `set_facecolor`

`set_figure(fig)`

Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(gid)`

Sets the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(hatch)`

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`

Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`

Set the label to *s* for auto legend.

### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [{'-', '-', '-.', ':', ', (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`

alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`

alias for `set_linewidth`

`set_lw(*args, **kwargs)`  
alias for `set_linewidth`

`set_norm(norm)`  
Set the normalization instance.

### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`  
Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`  
Set the offsets for the collection. `offsets` can be a scalar or a sequence.

### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`  
Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths()`

`set_picker(picker)`  
Set the epsilon for picking used by this artist

`picker` can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if `picker` is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if `picker` is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return `hit=True` and `props` is a dictionary of properties you want added to the `PickEvent` attributes.

### Parameters

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

**Parameters**

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

**rasterized** [bool or None]

`set_sizes(sizes, dpi=72.0)`

Set the sizes of each member of the collection.

**Parameters**

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float] The dpi of the canvas. Defaults to 72.0.

`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

**Parameters**

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

**Parameters****url** [str]set\_urls(*urls*)**Parameters****urls** [List[str] or None]set\_visible(*b*)

Set the artist's visibility.

**Parameters****b** [bool]set\_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level** [float]

stale

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky\_edges

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to\_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the *rgba* array will be floats in the 0-1 range; if it is *True*, the returned *rgba* array will be *uint8* in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary *prop*.

`update_from(other)`

copy properties from *other* to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

```
class matplotlib.collections.StarPolygonCollection(numsides, rotation=0, sizes=(1, ),
                                                    **kwargs)
```

Bases: `matplotlib.collections.RegularPolyCollection`

Draw a collection of regular stars with *numsides* points.

***numsides*** the number of sides of the polygon

***rotation*** the rotation of the polygon in radians

***sizes*** gives the area of the circle circumscribing the regular polygon in  $\text{points}^2$

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: `transforms.IdentityTransform()`
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

*offsets* and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

Example: see `/gallery/event_handling/lasso_demo` for a complete example:

```
offsets = np.random.rand(20,2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0,0,0,1)

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=(black,),
    linewidths=(1,))
```

(continues on next page)

```

offsets=offsets,
transOffset=ax.transData,
)

```

`add_callback(func)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`

Test whether the mouse event occurred in the collection.

Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

`convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

`draw(renderer)`

Derived classes drawing method

`findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If `include_self` is True (default), include self in the list to be checked for a match.

---

```

format_cursor_data(data)
    Return cursor data string formatted.

get_agg_filter()
    Return filter function to be used for agg filter.

get_alpha()
    Return the alpha value used for blending - not supported on all backends

get_animated()
    Return the artist's animated state

get_array()
    Return the array

get_capstyle()

get_children()
    Return a list of the child Artist's this :class:`Artist` contains.

get_clim()
    return the min, max of the color limits for image scaling

get_clip_box()
    Return artist clipbox

get_clip_on()
    Return whether artist uses clipping

get_clip_path()
    Return artist clip path

get_cmap()
    return the colormap

get_contains()
    Return the _contains test used by the artist, or None for default.

get_cursor_data(event)
    Get the cursor data for a given event.

get_dashes(*args, **kwargs)
    alias for get_linestyle

get_datalim(transData)

get_edgecolor()

get_edgecolors(*args, **kwargs)
    alias for get_edgecolor

get_facecolor()

get_facecolors(*args, **kwargs)
    alias for get_facecolor

get_figure()
    Return the Figure instance the artist belongs to.

get_fill()
    return whether fill is set

get_gid()
    Returns the group id.

```

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for *get\_linestyle*

`get_linewidth()`

`get_linewidths(*args, **kwargs)`  
alias for *get\_linewidth*

`get_lw(*args, **kwargs)`  
alias for *get\_linewidth*

`get_numsides()`

`get_offset_position()`  
Returns how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`  
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`  
Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_rotation()`

`get_sizes()`  
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

**Returns**

**sizes** [array] The 'area' of each element.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

**Returns**

**sketch\_params** [tuple or `None`] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`

Returns the snap setting which may be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

**bbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`  
Return the artist's zorder.

`have_units()`  
Return *True* if units are set on the x or y axes

`hitlist(event)`  
Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.  
  
List the children of the artist which contain the mouse event *event*.

`is_figure_set()`  
Deprecated since version 2.2: `artist.figure` is not `None`  
  
Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`  
Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`  
Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`  
Process pick event  
  
each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`  
Return *True* if *Artist* is pickable.

`properties()`  
return a dictionary mapping property name -> value for all *Artist* props

`remove()`  
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.  
  
Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.  
  
Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`  
Remove a callback based on its *id*.

**See also:**  
  
`add_callback()` For adding callbacks

`set(**kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`  
Set the agg filter.

### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or None]

`set_animated(b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`

alias for `set_antialiased`

`set_array(A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(cs)`

Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or

- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- *None*, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | *None*]

`set_cmap(cmap)`  
set the colormap for luminance data

#### Parameters

**cmap** [colormap or registered colormap name]

`set_color(c)`  
Set both the edgecolor and the facecolor.

#### See also:

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

#### Parameters

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`  
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

#### Parameters

**picker** [callable]

`set_dashes(*args, **kwargs)`  
alias for `set_linestyle`

`set_edgecolor(c)`  
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

#### Parameters

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`  
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`

alias for `set_facecolor`

`set_figure(fig)`

Set the *Figure* instance the artist belongs to.

### Parameters

**fig** [*Figure*]

`set_gid(gid)`

Sets the (group) id for the artist.

### Parameters

**gid** [str]

`set_hatch(hatch)`

Set the hatching pattern

*hatch* can be one of:

```

/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout** [bool]

`set_joinstyle(js)`

Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

### Parameters

**js** [{'miter', 'round', 'bevel'}] The jointstyle

`set_label(s)`

Set the label to *s* for auto legend.

### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [{'-', '-', '-.', ':', ', (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`

alias for `set_linestyle`

`set_linewidth(lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`

alias for `set_linewidth`

`set_lw(*args, **kwargs)`

alias for `set_linewidth`

`set_norm(norm)`

Set the normalization instance.

### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`

Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

**Parameters**

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`

Set the path effects.

**Parameters**

**path\_effects** [*AbstractPathEffect*]

`set_paths()`

`set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the *PickEvent* attributes.

**Parameters**

**picker** [None or bool or float or callable]

`set_pickradius(pr)`

Set the pick radius used for containment tests.

**Parameters**

**d** [float] Pick radius, in points.

`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to *None*, which implies the backend's default behavior.

**Parameters**

**rasterized** [bool or *None*]

`set_sizes(sizes, dpi=72.0)`

Set the sizes of each member of the collection.

**Parameters**

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float] The dpi of the canvas. Defaults to 72.0.

`set_sketch_params(scale=None, length=None, randomness=None)`  
Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

#### Parameters

**url** [str]

`set_urls(urls)`

#### Parameters

**urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]**stale**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**sticky\_edges**

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to\_rgba(x, alpha=None, bytes=False, norm=True)**

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update(props)**

Update this artist's properties from the dictionary *prop*.

**update\_from(other)**

copy properties from other to self

**update\_scalarmappable()**

If the scalar mappable array is not none, update colors from scalar data

**zorder** = 0

```
class matplotlib.collections.TriMesh(triangulation, **kwargs)
```

Bases: *matplotlib.collections.Collection*

Class for the efficient drawing of a triangular mesh using Gouraud shading.

A triangular mesh is a *Triangulation* object.

`add_callback(func)`

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker(checker)`

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *Axes* instance the artist resides in, or *None*.

`changed()`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update(checker)`

If mappable has changed since the last check, return True; else return False

`contains(mouseevent)`

Test whether the mouse event occurred in the collection.

Returns True | False, dict(ind=itemlist), where every item in itemlist contains the event.

`static convert_mesh_to_paths(tri)`

Converts a given mesh into a sequence of `matplotlib.path.Path` objects for easier rendering by backends that do not directly support meshes.

This function is primarily of use to backend implementers.

`convert_xunits(x)`

For artists in an axes, if the xaxis has units support, convert x using xaxis unit type

`convert_yunits(y)`

For artists in an axes, if the yaxis has units support, convert y using yaxis unit type

`draw(renderer)`

Derived classes drawing method

`findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

*match* can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., `Line2D`. Only return artists of class type.

If *include\_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data(data)`  
Return *cursor data* string formatted.

`get_agg_filter()`  
Return filter function to be used for agg filter.

`get_alpha()`  
Return the alpha value used for blending - not supported on all backends

`get_animated()`  
Return the artist's animated state

`get_array()`  
Return the array

`get_capstyle()`

`get_children()`  
Return a list of the child Artist's this :class:`Artist` contains.

`get_clim()`  
return the min, max of the color limits for image scaling

`get_clip_box()`  
Return artist clipbox

`get_clip_on()`  
Return whether artist uses clipping

`get_clip_path()`  
Return artist clip path

`get_cmap()`  
return the colormap

`get_contains()`  
Return the `_contains` test used by the artist, or *None* for default.

`get_cursor_data(event)`  
Get the cursor data for a given event.

`get_dashes(*args, **kwargs)`  
alias for *get\_linestyle*

`get_datalim(transData)`

`get_edgecolor()`

`get_edgecolors(*args, **kwargs)`  
alias for *get\_edgecolor*

`get_facecolor()`

`get_facecolors(*args, **kwargs)`  
alias for *get\_facecolor*

`get_figure()`  
Return the *Figure* instance the artist belongs to.

`get_fill()`  
return whether fill is set

`get_gid()`  
Returns the group id.

`get_hatch()`  
Return the current hatching pattern.

`get_in_layout()`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle()`

`get_label()`  
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles(*args, **kwargs)`  
alias for `get_linestyle`

`get_linewidth()`

`get_linewidths(*args, **kwargs)`  
alias for `get_linewidth`

`get_lw(*args, **kwargs)`  
alias for `get_linewidth`

`get_offset_position()`  
Returns how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`  
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`  
Return the picker object used by this artist.

`get_pickradius()`

`get_rasterized()`  
Return whether the artist is to be rasterized.

`get_sketch_params()`  
Returns the sketch parameters for the artist.

### Returns

**sketch\_params** [tuple or None] A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

**bbbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`

Returns the url.

`get_urls()`

`get_visible()`

Return the artist's visibility

`get_window_extent(renderer)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder()`

Return the artist's zorder.

`have_units()`

Return *True* if units are set on the x or y axes

`hitlist(event)`

Deprecated since version 2.2: The hitlist function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

List the children of the artist which contain the mouse event *event*.

`is_figure_set()`

Deprecated since version 2.2: `artist.figure` is not `None`

Returns whether the artist is assigned to a *Figure*.

`is_transform_set()`

Returns *True* if *Artist* has a transform explicitly set.

`mouseover`

`pchanged()`

Fire an event when property changed, calling all of the registered callbacks.

`pick(mouseevent)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable()`

Return *True* if *Artist* is pickable.

`properties()`

return a dictionary mapping property name -> value for all *Artist* props

`remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(oid)`

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter(filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(alpha)`

Set the alpha transparencies of the collection. *alpha* must be a float or *None*.

**Parameters**

**alpha** [float or *None*]

`set_animated(b)`

Set the artist's animation state.

**Parameters****b** [bool]

`set_antialiased(aa)`  
Set the antialiasing state for rendering.

**Parameters****aa** [bool or sequence of bools]

`set_antialiaseds(*args, **kwargs)`  
alias for `set_antialiased`

`set_array(A)`  
Set the image array from numpy array *A*.

**Parameters****A** [ndarray]

`set_capstyle(cs)`  
Set the capstyle for the collection. The capstyle can only be set globally for all elements in the collection

**Parameters****cs** [{'butt', 'round', 'projecting'}] The capstyle

`set_clim(vmin=None, vmax=None)`  
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as (*vmin*, *vmax*) which is used to support `setp`

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have *vmin* and *vmax* kwargs.

`set_clip_box(clipbox)`  
Set the artist's clip *Bbox*.

**Parameters****clipbox** [*Bbox*]

`set_clip_on(b)`  
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters****b** [bool]

`set_clip_path(path, transform=None)`  
Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | None]

`set_cmap(cmap)`  
set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

`set_color(c)`  
Set both the edgecolor and the facecolor.

**See also:**

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

**Parameters**

**c** [matplotlib color arg or sequence of rgba tuples]

`set_contains(picker)`  
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit* = *True* and *props* is a dictionary of properties you want returned with the contains test.

**Parameters**

**picker** [callable]

`set_dashes(*args, **kwargs)`  
alias for `set_linestyle`

`set_edgecolor(c)`  
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

**Parameters**

**c** [color or sequence of colors]

`set_edgecolors(*args, **kwargs)`  
alias for `set_edgecolor`

`set_facecolor(c)`  
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters**

**c** [color or sequence of colors]

`set_facecolors(*args, **kwargs)`  
alias for `set_facecolor`

`set_figure(fig)`  
Set the *Figure* instance the artist belongs to.

**Parameters**

**fig** [*Figure*]

`set_gid(gid)`  
Sets the (group) id for the artist.

**Parameters**

**gid** [str]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

```

/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_in_layout(in_layout)`  
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

**Parameters**

**in\_layout** [bool]

`set_joinstyle(js)`  
Set the joinstyle for the collection. The joinstyle can only be set globally for all elements in the collection.

**Parameters**

**js** [{'miter', 'round', 'bevel'}] The joinstyle

`set_label(s)`  
Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling *str*.

`set_linestyle(ls)`  
Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

#### Parameters

**ls** [{"-'", '--', '-.', ':', "", (offset, on-off-seq), ...}] The line style.

`set_linestyles(*args, **kwargs)`  
alias for `set_linestyle`

`set_linewidth(lw)`  
Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or sequence of floats]

`set_linewidths(*args, **kwargs)`  
alias for `set_linewidth`

`set_lw(*args, **kwargs)`  
alias for `set_linewidth`

`set_norm(norm)`  
Set the normalization instance.

#### Parameters

**norm** [*Normalize*]

`set_offset_position(offset_position)`  
Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

`set_offsets(offsets)`  
Set the offsets for the collection. `offsets` can be a scalar or a sequence.

#### Parameters

**offsets** [float or sequence of floats]

`set_path_effects(path_effects)`  
Set the path effects.

**Parameters****path\_effects** [*AbstractPathEffect*]`set_paths()``set_picker(picker)`

Set the epsilon for picking used by this artist

*picker* can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if *picker* is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the `PickEvent` attributes.

**Parameters****picker** [None or bool or float or callable]`set_pickradius(pr)`

Set the pick radius used for containment tests.

**Parameters****d** [float] Pick radius, in points.`set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to *None*, which implies the backend's default behavior.**Parameters****rasterized** [bool or None]`set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If *scale* is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None]

`set_transform(t)`

Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(url)`

Sets the url for the artist.

#### Parameters

**url** [str]

`set_urls(urls)`

#### Parameters

**urls** [List[str] or None]

`set_visible(b)`

Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

x and y sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the *norm* and *colormap* set for this *ScalarMappable*.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a *ValueError* will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A *ValueError* will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(props)`

Update this artist's properties from the dictionary *prop*.

`update_from(other)`

copy properties from *other* to self

`update_scalarmappable()`

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

## 18.14 colorbar

### 18.14.1 matplotlib.colorbar

Colorbar toolkit with two classes and a function:

*ColorbarBase* the base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

*Colorbar* the derived class for use with images or contour plots.

*make\_axes()* a function for resizing an axes and adding a second axes suitable for a colorbar

The *colorbar()* method uses *make\_axes()* and *Colorbar*; the *colorbar()* function is a thin wrapper over *colorbar()*.

```
class matplotlib.colorbar.Colorbar(ax, mappable, **kw)
```

Bases: `matplotlib.colorbar.ColorbarBase`

This class connects a `ColorbarBase` to a `ScalarMappable` such as a `AxesImage` generated via `imshow()`.

It is not intended to be instantiated directly; instead, use `colorbar()` or `colorbar()` to make your colorbar.

```
add_lines(CS, erase=True)
```

Add the lines from a non-filled `ContourSet` to the colorbar.

Set `erase` to `False` if these lines should be added to any pre-existing lines.

```
minorticks_off()
```

Turns off the minor ticks on the colorbar.

```
minorticks_on()
```

Turns on the minor ticks on the colorbar without extruding into the "extend regions".

```
on_mappable_changed(mappable)
```

Updates this colorbar to match the mappable's properties.

Typically this is automatically registered as an event handler by `colorbar_factory()` and should not be called manually.

```
remove()
```

Remove this colorbar from the figure. If the colorbar was created with `use_gridspec=True` then restore the `gridspec` to its previous value.

```
update_bruteforce(mappable)
```

Destroy and rebuild the colorbar. This is intended to become obsolete, and will probably be deprecated and then removed. It is not called when the `pyplot.colorbar` function or the `Figure.colorbar` method are used to create the colorbar.

```
update_normal(mappable)
```

update solid, lines, etc. Unlike `update_bruteforce`, it does not clear the axes. This is meant to be called when the image or contour plot to which this colorbar belongs is changed.

```
class matplotlib.colorbar.ColorbarBase(ax, cmap=None, norm=None, alpha=None,
                                       values=None, boundaries=None, ori-
                                       entation='vertical', ticklocation='auto',
                                       extend='neither', spacing='uniform',
                                       ticks=None, format=None, drawedges=False,
                                       filled=True, extendfrac=None, exten-
                                       drect=False, label="")
```

Bases: `matplotlib.cm.ScalarMappable`

Draw a colorbar in an existing axes.

This is a base class for the `Colorbar` class, which is the basis for the `colorbar()` function and the `colorbar()` method, which are the usual ways of creating a colorbar.

It is also useful by itself for showing a colormap. If the `cmap` kwarg is given but `boundaries` and `values` are left as `None`, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the `norm` as:

```
colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```
norm=colors.NoNorm.
```

Useful public methods are `set_label()` and `add_lines()`.

### Attributes

**ax** [Axes] The Axes instance in which the colorbar is drawn.

**lines** [list] A list of LineCollection if lines were drawn, otherwise an empty list.

**dividers** [LineCollection] A LineCollection if `drawedges` is True, otherwise None.

`add_lines(levels, colors, linewidths, erase=True)`

Draw lines on the colorbar.

`colors` and `linewidths` must be scalars or sequences the same length as `levels`.

Set `erase` to False to add lines without first removing any previously added lines.

`ax = None`

The axes that this colorbar lives in.

`config_axis()`

`draw_all()`

Calculate any free parameters based on the current cmap and norm, and do all the drawing.

`get_ticks(minor=False)`

Return the x ticks as a list of locations

`n_rasterize = 50`

`remove()`

Remove this colorbar from the figure

`set_alpha(alpha)`

`set_label(label, **kw)`

Label the long axis of the colorbar

`set_ticklabels(ticklabels, update_ticks=True)`

set tick labels. Tick labels are updated immediately unless `update_ticks` is False. To manually update the ticks, call `update_ticks()` method explicitly.

`set_ticks(ticks, update_ticks=True)`

Set tick locations.

### Parameters

**ticks** [{None, sequence, Locator instance}] If None, a default Locator will be used.

**update\_ticks** [{True, False}, optional] If True, tick locations are updated immediately. If False, use `update_ticks()` to manually update the ticks.

`update_ticks()`

Force the update of the ticks and ticklabels. This must be called whenever the tick locator and/or tick formatter changes.

```
class matplotlib.colorbar.ColorbarPatch(ax, mappable, **kw)
```

Bases: `matplotlib.colorbar.Colorbar`

A Colorbar which is created using `Patch` rather than the default `pcolor()`.

It uses a list of `Patch` instances instead of a `PatchCollection` because the latter does not allow the hatch pattern to vary among the members of the collection.

```
matplotlib.colorbar.colorbar_factory(cax, mappable, **kwargs)
```

Creates a colorbar on the given axes for the given mappable.

Typically, for automatic colorbar placement given only a mappable use `colorbar()`.

```
matplotlib.colorbar.make_axes(parents, location=None, orientation=None, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Resize and reposition parent axes, and return a child axes suitable for a colorbar.

Keyword arguments may include the following (with defaults):

**location** [[None|'left'|'right'|'top'|'bottom']] The position, relative to **parents**, where the colorbar axes should be created. If None, the value will either come from the given **orientation**, else it will default to 'right'.

**orientation** [[None|'vertical'|'horizontal']] The orientation of the colorbar. Typically, this keyword shouldn't be used, as it can be derived from the **location** keyword.

Property	Description
<i>orientation</i>	vertical or horizontal
<i>fraction</i>	0.15; fraction of original axes to use for colorbar
<i>pad</i>	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
<i>shrink</i>	1.0; fraction by which to multiply the size of the colorbar
<i>aspect</i>	20; ratio of long to short dimensions
<i>anchor</i>	(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes
<i>panchor</i>	(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged

Returns (cax, kw), the child axes and the reduced kw dictionary to be passed when creating the colorbar instance.

```
matplotlib.colorbar.make_axes_gridspec(parent, *, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Resize and reposition a parent axes, and return a child axes suitable for a colorbar. This function is similar to `make_axes`. Primary differences are

- `make_axes_gridspec` only handles the `orientation` keyword and cannot handle the "location" keyword.
- `make_axes_gridspec` should only be used with a subplot parent.
- **`make_axes` creates an instance of `Axes`. `make_axes_gridspec` creates an instance of `Subplot`.**

- ***make\_axes*** updates the position of the parent. *make\_axes\_gridspec* replaces the `grid_spec` attribute of the parent with a new one.

While this function is meant to be compatible with *make\_axes*, there could be some minor differences.

Keyword arguments may include the following (with defaults):

***orientation*** 'vertical' or 'horizontal'

Property	Description
<i>orientation</i>	vertical or horizontal
<i>fraction</i>	0.15; fraction of original axes to use for colorbar
<i>pad</i>	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
<i>shrink</i>	1.0; fraction by which to multiply the size of the colorbar
<i>aspect</i>	20; ratio of long to short dimensions
<i>anchor</i>	(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes
<i>panchor</i>	(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged

All but the first of these are stripped from the input kw set.

Returns (cax, kw), the child axes and the reduced kw dictionary to be passed when creating the colorbar instance.

## 18.15 colors

For a visual representation of the Matplotlib colormaps, see:

- The `color_examples` examples for examples of controlling color with Matplotlib.
- The [Colors](#) tutorial for an in-depth guide on controlling color.

### 18.15.1 matplotlib.colors

A module for converting numbers or color arguments to *RGB* or *RGBA*

*RGB* and *RGBA* are sequences of, respectively, 3 or 4 floats in the range 0-1.

This module includes functions and classes for color specification conversions, and for mapping numbers to colors in a 1-D array of colors called a colormap. Colormapping typically involves two steps: a data array is first mapped onto the range 0-1 using an instance of *Normalize* or of a subclass; then this number in the 0-1 range is mapped to a color using an instance of a subclass of *Colormap*. Two are provided here: *LinearSegmentedColormap*, which is used to generate all the built-in colormap instances, but is also useful for making custom colormaps, and *ListedColormap*, which is used for generating a custom colormap from a list of color specifications.

The module also provides functions for checking whether an object can be interpreted as a color (*is\_color\_like()*), for converting such an object to an RGBA tuple (*to\_rgba()*) or to an HTML-like hex string in the #rrggbb format (*to\_hex()*), and a sequence of colors to an (n, 4) RGBA array (*to\_rgba\_array()*). Caching is used for efficiency.

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA tuple of float values in [0, 1] (e.g., (0.1, 0.2, 0.5) or (0.1, 0.2, 0.5, 0.3));
- a hex RGB or RGBA string (e.g., '#0F0F0F' or '#0F0F0F0F');
- a string representation of a float value in [0, 1] inclusive for gray level (e.g., '0.5');
- one of {'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'};
- a X11/CSS4 color name;
- a name from the [xkcd color survey](#); prefixed with 'xkcd:' (e.g., 'xkcd:sky blue');
- one of {'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab:cyan'} which are the Tableau Colors from the 'T10' categorical palette (which is the default color cycle);
- a "CN" color spec, i.e. 'C' followed by a single digit, which is an index into the default property cycle (`matplotlib.rcParams['axes.prop_cycle']`); the indexing occurs at artist creation time and defaults to black if the cycle does not include color.

All string specifications of color, other than "CN", are case-insensitive.

## Classes

<i>BoundaryNorm</i> (boundaries, ncolors[, clip])	Generate a colormap index based on discrete intervals.
<i>Colormap</i> (name[, N])	Baseclass for all scalar to RGBA mappings.
<i>LightSource</i> ([azdeg, altdeg, hsv_min_val, ...])	Create a light source coming from the specified azimuth and elevation.
<i>LinearSegmentedColormap</i> (name, segment-data[, ...])	Colormap objects based on lookup tables using linear segments.
<i>ListedColormap</i> (colors[, name, N])	Colormap object generated from a list of colors.
<i>LogNorm</i> ([vmin, vmax, clip])	Normalize a given value to the 0-1 range on a log scale
<i>NoNorm</i> ([vmin, vmax, clip])	Dummy replacement for Normalize, for the case where we want to use indices directly in a <i>ScalarMappable</i> .
<i>Normalize</i> ([vmin, vmax, clip])	A class which, when called, can normalize data into the [0.0, 1.0] interval.
<i>PowerNorm</i> (gamma[, vmin, vmax, clip])	Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.
<i>SymLogNorm</i> (linthresh[, linscale, vmin, ...])	The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

**matplotlib.colors.BoundaryNorm**

```
class matplotlib.colors.BoundaryNorm(boundaries, ncolors, clip=False)
```

Bases: `matplotlib.colors.Normalize`

Generate a colormap index based on discrete intervals.

Unlike `Normalize` or `LogNorm`, `BoundaryNorm` maps values to integers instead of to the interval 0-1.

Mapping to the 0-1 interval could have been done via piece-wise linear interpolation, but using integers seems simpler, and reduces the number of conversions back and forth between integer and floating point.

**Parameters**

**boundaries** [array-like] Monotonically increasing sequence of boundaries

**ncolors** [int] Number of colors in the colormap to be used

**clip** [bool, optional] If clip is True, out of range values are mapped to 0 if they are below `boundaries[0]` or mapped to `ncolors - 1` if they are above `boundaries[-1]`.

If clip is False, out of range values are mapped to -1 if they are below `boundaries[0]` or mapped to `ncolors` if they are above `boundaries[-1]`. These are then converted to valid indices by `Colormap.__call__()`.

**Notes**

`boundaries` defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins doesn't equal `ncolors`, the color is chosen by linear interpolation of the bin number onto color numbers.

`inverse(value)`

**Raises**

**ValueError** `BoundaryNorm` is not invertible, so calling this method will always raise an error

**Examples using matplotlib.colors.BoundaryNorm**

- *Colormap Normalization*

### matplotlib.colors.Colormap

```
class matplotlib.colors.Colormap(name, N=256)
```

Bases: `object`

Baseclass for all scalar to RGBA mappings.

Typically Colormap instances are used to convert data values (floats) from the interval `[0, 1]` to the RGBA color that the respective Colormap represents. For scaling of data into the `[0, 1]` interval see `matplotlib.colors.Normalize`. It is worth noting that `matplotlib.cm.ScalarMappable` subclasses make heavy use of this `data->normalize->map-to-color` processing chain.

#### Parameters

**name** [str] The name of the colormap.

**N** [int] The number of rgb quantization levels.

`colorbar_extend = None`

When this colormap exists on a scalar mappable and `colorbar_extend` is not `False`, `colorbar` creation will pick up `colorbar_extend` as the default value for the `extend` keyword in the `matplotlib.colorbar.Colorbar` constructor.

`is_gray()`

`reversed(name=None)`

Make a reversed instance of the Colormap.

---

**Note:** Function not implemented for base class.

---

#### Parameters

**name** [str, optional] The name for the reversed colormap. If it's `None` the name will be the name of the parent colormap + `"_r"`.

#### Notes

See `LinearSegmentedColormap.reversed()` and `ListedColormap.reversed()`

`set_bad(color='k', alpha=None)`

Set color to be used for masked values.

`set_over(color='k', alpha=None)`

Set color to be used for high out-of-range values. Requires `norm.clip = False`

`set_under(color='k', alpha=None)`

Set color to be used for low out-of-range values. Requires `norm.clip = False`

### Examples using `matplotlib.colors.Colormap`

- `sphx_glr_gallery_images_contours_and_fields_contourf_demo.py`

**matplotlib.colors.LightSource**

```
class matplotlib.colors.LightSource(azdeg=315, altdeg=45, hsv_min_val=0,
                                     hsv_max_val=1, hsv_min_sat=1, hsv_max_sat=0)
```

Bases: `object`

Create a light source coming from the specified azimuth and elevation. Angles are in degrees, with the azimuth measured clockwise from north and elevation up from the zero plane of the surface.

The `shade()` is used to produce "shaded" rgb values for a data array. `shade_rgb()` can be used to combine an rgb image with The `shade_rgb()` The `hillshade()` produces an illumination map of a surface.

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

**Parameters**

**azdeg** [number, optional] The azimuth (0-360, degrees clockwise from North) of the light source. Defaults to 315 degrees (from the northwest).

**altdeg** [number, optional] The altitude (0-90, degrees up from horizontal) of the light source. Defaults to 45 degrees from horizontal.

**Notes**

For backwards compatibility, the parameters `hsv_min_val`, `hsv_max_val`, `hsv_min_sat`, and `hsv_max_sat` may be supplied at initialization as well. However, these parameters will only be used if "blend\_mode='hsv'" is passed into `shade()` or `shade_rgb()`. See the documentation for `blend_hsv()` for more details.

```
blend_hsv(rgb, intensity, hsv_max_sat=None, hsv_max_val=None,
           hsv_min_val=None, hsv_min_sat=None)
```

Take the input data array, convert to HSV values in the given colormap, then adjust those color values to give the impression of a shaded relief map with a specified light source. RGBA values are returned, which can then be used to plot the shaded image with `imshow`.

The color of the resulting image will be darkened by moving the (s,v) values (in hsv colorspace) toward (hsv\_min\_sat, hsv\_min\_val) in the shaded regions, or lightened by sliding (s,v) toward (hsv\_max\_sat, hsv\_max\_val) in regions that are illuminated. The default extremes are chose so that completely shaded points are nearly black (s = 1, v = 0) and completely illuminated points are nearly white (s = 0, v = 1).

**Parameters**

**rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

**hsv\_max\_sat** [number, optional] The maximum saturation value that the `intensity` map can shift the output image to. Defaults to 1.

**hsv\_min\_sat** [number, optional] The minimum saturation value that the `intensity` map can shift the output image to. Defaults to 0.

**hsv\_max\_val** [number, optional] The maximum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 1.

**hsv\_min\_val: number, optional** The minimum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 0.

#### Returns

**rgb** [ndarray] An MxNx3 RGB array representing the combined images.

`blend_overlay(rgb, intensity)`

Combines an rgb image with an intensity map using "overlay" blending.

#### Parameters

**rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

#### Returns

**rgb** [ndarray] An MxNx3 RGB array representing the combined images.

`blend_soft_light(rgb, intensity)`

Combines an rgb image with an intensity map using "soft light" blending. Uses the "pegtop" formula.

#### Parameters

**rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

#### Returns

**rgb** [ndarray] An MxNx3 RGB array representing the combined images.

`direction`

The unit vector direction towards the light source

`hillshade(elevation, vert_exag=1, dx=1, dy=1, fraction=1.0)`

Calculates the illumination intensity for a surface using the defined azimuth and elevation for the light source.

This computes the normal vectors for the surface, and then passes them on to `shade_normals`

#### Parameters

**elevation** [array-like] A 2d array (or equivalent) of the height values used to generate an illumination map

**vert\_exag** [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topographic effects.

**dx** [number, optional] The x-spacing (columns) of the input *elevation* grid.

**dy** [number, optional] The y-spacing (rows) of the input *elevation* grid.

**fraction** [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

### Returns

---

**intensity** [ndarray] A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

`shade(data, cmap, norm=None, blend_mode='overlay', vmin=None, vmax=None, vert_exag=1, dx=1, dy=1, fraction=1, **kwargs)`

Combine colormapped data values with an illumination intensity map (a.k.a. "hillshade") of the values.

### Parameters

**data** [array-like] A 2d array (or equivalent) of the height values used to generate a shaded map.

**cmap** [*Colormap* instance] The colormap used to color the *data* array. Note that this must be a *Colormap* instance. For example, rather than passing in `cmap='gist_earth'`, use `cmap=plt.get_cmap('gist_earth')` instead.

**norm** [*Normalize* instance, optional] The normalization used to scale values before colormapping. If *None*, the input will be linearly scaled between its min and max.

**blend\_mode** [{*'hsv'*, *'overlay'*, *'soft'*} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. Default is "overlay". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend\_mode* function.

**vmin** [scalar or *None*, optional] The minimum value used in colormapping *data*. If *None* the minimum value in *data* is used. If *norm* is specified, then this argument will be ignored.

**vmax** [scalar or *None*, optional] The maximum value used in colormapping *data*. If *None* the maximum value in *data* is used. If *norm* is specified, then this argument will be ignored.

**vert\_exag** [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topography.

**dx** [number, optional] The x-spacing (columns) of the input *elevation* grid.

**dy** [number, optional] The y-spacing (rows) of the input *elevation* grid.

**fraction** [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to

move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

**Additional kwargs are passed on to the `*blend_mode*` function.**

### Returns

**rgba** [ndarray] An  $M \times N \times 4$  array of floats ranging between 0-1.

`shade_normals(normals, fraction=1.0)`

Calculates the illumination intensity for the normal vectors of a surface using the defined azimuth and elevation for the light source.

Imagine an artificial sun placed at infinity in some azimuth and elevation position illuminating our surface. The parts of the surface that slope toward the sun should brighten while those sides facing away should become darker.

### Parameters

**fraction** [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

### Returns

**intensity** [ndarray] A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

`shade_rgb(rgb, elevation, fraction=1.0, blend_mode='hsv', vert_exag=1, dx=1, dy=1, **kwargs)`

Take the input RGB array ( $ny \times nx \times 3$ ) adjust their color values to given the impression of a shaded relief map with a specified light source using the elevation ( $ny \times nx$ ). A new RGB array ( $(ny \times nx \times 3)$ ) is returned.

### Parameters

**rgb** [array-like] An  $M \times N \times 3$  RGB array, assumed to be in the range of 0 to 1.

**elevation** [array-like] A 2d array (or equivalent) of the height values used to generate a shaded map.

**fraction** [number] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

**blend\_mode** [{`'hsv'`, `'overlay'`, `'soft'`} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. For backwards compatibility, this defaults to `"hsv"`. Note that for most topographic surfaces, `"overlay"` or `"soft"` appear more visually realistic. If a user-defined function is supplied, it is expected to combine an  $M \times N \times 3$  RGB array of floats (ranging 0 to 1) with an  $M \times N \times 1$  hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the `blend_mode` function.

**vert\_exag** [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topography.

**dx** [number, optional] The x-spacing (columns) of the input *elevation* grid.

**dy** [number, optional] The y-spacing (rows) of the input *elevation* grid.

**Additional kwargs are passed on to the *\*blend\_mode\** function.**

### Returns

**shaded\_rgb** [ndarray] An MxNx3 array of floats ranging between 0-1.

### Examples using `matplotlib.colors.LightSource`

- `sphx_glr_gallery_images_contours_and_fields_shading_example.py`
- `sphx_glr_gallery_showcase_mandelbrot.py`
- `sphx_glr_gallery_frontpage_3D.py`
- `sphx_glr_gallery_misc_demo_agg_filter.py`
- `sphx_glr_gallery_mplot3d_custom_shaded_3d_surface.py`
- `sphx_glr_gallery_specialty_plots_advanced_hillshading.py`
- `sphx_glr_gallery_specialty_plots_topographic_hillshading.py`

### `matplotlib.colors.LinearSegmentedColormap`

```
class matplotlib.colors.LinearSegmentedColormap(name, segmentdata, N=256,
                                                gamma=1.0)
```

Bases: `matplotlib.colors.Colormap`

Colormap objects based on lookup tables using linear segments.

The lookup table is generated using linear interpolation for each primary color, with the 0-1 domain divided into any number of segments.

Create color map from linear mapping segments

`segmentdata` argument is a dictionary with a red, green and blue entries. Each entry should be a list of `x`, `y0`, `y1` tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```
cdict = {'red': [(0.0, 0.0, 0.0),
                (0.5, 1.0, 1.0),
                (1.0, 1.0, 1.0)],
         'green': [(0.0, 0.0, 0.0),
                  (0.25, 0.0, 0.0),
                  (0.75, 1.0, 1.0),
                  (1.0, 1.0, 1.0)],
```

(continues on next page)

(continued from previous page)

```
'blue': [(0.0, 0.0, 0.0),
         (0.5, 0.0, 0.0),
         (1.0, 1.0, 1.0)]}
```

Each row in the table for a given color is a sequence of  $x, y0, y1$  tuples. In each sequence,  $x$  must increase monotonically from 0 to 1. For any input value  $z$  falling between  $x[i]$  and  $x[i+1]$ , the output value of a given color will be linearly interpolated between  $y1[i]$  and  $y0[i+1]$ :

```
row i:   x  y0  y1
         /
row i+1: x  y0  y1
```

Hence  $y0$  in the first row and  $y1$  in the last row are never used.

### See also:

*LinearSegmentedColormap.from\_list()* Static method; factory function for generating a smoothly-varying `LinearSegmentedColormap`.

*makeMappingArray()* For information about making a mapping array.

`static from_list(name, colors, N=256, gamma=1.0)`

Make a linear segmented colormap with *name* from a sequence of *colors* which evenly transitions from `colors[0]` at `val=0` to `colors[-1]` at `val=1`. *N* is the number of rgb quantization levels. Alternatively, a list of (value, color) tuples can be given to divide the range unevenly.

`reversed(name=None)`

Make a reversed instance of the `Colormap`.

### Parameters

**name** [str, optional] The name for the reversed colormap. If it's `None` the name will be the name of the parent colormap + "\_r".

### Returns

**LinearSegmentedColormap** The reversed colormap.

`set_gamma(gamma)`

Set a new gamma value and regenerate color map.

### Examples using `matplotlib.colors.LinearSegmentedColormap`

- `sphx_glr_gallery_images_contours_and_fields_custom_cmap.py`

### `matplotlib.colors.ListedColormap`

`class matplotlib.colors.ListedColormap(colors, name='from_list', N=None)`

Bases: `matplotlib.colors.Colormap`

Colormap object generated from a list of colors.

This may be most useful when indexing directly into a colormap, but it can also be used to generate special colormaps for ordinary mapping.

Make a colormap from a list of colors.

**colors** a list of matplotlib color specifications, or an equivalent Nx3 or Nx4 floating point array (*N* rgb or rgba values)

**name** a string to identify the colormap

**N** the number of entries in the map. The default is *None*, in which case there is one colormap entry for each element in the list of colors. If:

```
N < len(colors)
```

the list will be truncated at *N*. If:

```
N > len(colors)
```

the list will be extended by repetition.

`reversed(name=None)`

Make a reversed instance of the Colormap.

#### Parameters

**name** [str, optional] The name for the reversed colormap. If it's *None* the name will be the name of the parent colormap + "\_r".

#### Returns

**ListedColormap** A reversed instance of the colormap.

#### Examples using `matplotlib.colors.ListedColormap`

- [sphx\\_glr\\_gallery\\_lines\\_bars\\_and\\_markers\\_multicolored\\_line.py](#)
- [sphx\\_glr\\_gallery\\_specialty\\_plots\\_leftventricle\\_bulleye.py](#)
- [Customized Colorbars Tutorial](#)

#### `matplotlib.colors.LogNorm`

`class matplotlib.colors.LogNorm(vmin=None, vmax=None, clip=False)`

Bases: `matplotlib.colors.Normalize`

Normalize a given value to the 0-1 range on a log scale

If *vmin* or *vmax* is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, `__call__(A)` calls `autoscale_None(A)`. If *clip* is *True* and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

```
vmin==vmax
```

Works with scalars or arrays, including masked arrays. If *clip* is *True*, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is *clip = False*.

`autoscale(A)`

Set *vmin*, *vmax* to min, max of *A*.

```
autoscale_None(A)
    autoscale only None-valued vmin or vmax.
inverse(value)
```

#### Examples using `matplotlib.colors.LogNorm`

- `sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py`
- `sphx_glr_gallery_statistics_hist.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations_lognorm.py`
- [Colormap Normalization](#)

#### `matplotlib.colors.NoNorm`

```
class matplotlib.colors.NoNorm(vmin=None, vmax=None, clip=False)
```

Bases: `matplotlib.colors.Normalize`

Dummy replacement for `Normalize`, for the case where we want to use indices directly in a `ScalarMappable`.

If `vmin` or `vmax` is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, `__call__(A)` calls `autoscale_None(A)`. If `clip` is `True` and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

```
vmin==vmax
```

Works with scalars or arrays, including masked arrays. If `clip` is `True`, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is `clip = False`.

```
inverse(value)
```

#### `matplotlib.colors.Normalize`

```
class matplotlib.colors.Normalize(vmin=None, vmax=None, clip=False)
```

Bases: `object`

A class which, when called, can normalize data into the `[0.0, 1.0]` interval.

If `vmin` or `vmax` is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, `__call__(A)` calls `autoscale_None(A)`. If `clip` is `True` and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

```
vmin==vmax
```

Works with scalars or arrays, including masked arrays. If `clip` is `True`, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting

the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is `clip = False`.

`autoscale(A)`

Set `vmin`, `vmax` to min, max of `A`.

`autoscale_None(A)`

autoscale only None-valued `vmin` or `vmax`.

`inverse(value)`

`static process_value(value)`

Homogenize the input `value` for easy and efficient normalization.

`value` can be a scalar or sequence.

Returns `result`, `is_scalar`, where `result` is a masked array matching `value`. Float dtypes are preserved; integer types with two bytes or smaller are converted to `np.float32`, and larger types are converted to `np.float64`. Preserving `float32` when possible, and using in-place operations, can greatly improve speed for large arrays.

Experimental; we may want to add an option to force the use of `float32`.

`scaled()`

return true if `vmin` and `vmax` set

#### Examples using `matplotlib.colors.Normalize`

#### `matplotlib.colors.PowerNorm`

`class matplotlib.colors.PowerNorm(gamma, vmin=None, vmax=None, clip=False)`

Bases: `matplotlib.colors.Normalize`

Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.

`autoscale(A)`

Set `vmin`, `vmax` to min, max of `A`.

```
autoscale_None(A)
    autoscale only None-valued vmin or vmax.
inverse(value)
```

#### Examples using `matplotlib.colors.PowerNorm`

- `sphx_glr_gallery_showcase_mandelbrot.py`
- `sphx_glr_gallery_scales_power_norm.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations_power.py`
- [Colormap Normalization](#)

#### `matplotlib.colors.SymLogNorm`

```
class matplotlib.colors.SymLogNorm(linthresh, linscale=1.0, vmin=None, vmax=None,
                                   clip=False)
```

Bases: `matplotlib.colors.Normalize`

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter `linthresh` allows the user to specify the size of this range (`-linthresh, linthresh`).

*linthresh*: The range within which the plot is linear (to avoid having the plot go to infinity around zero).

*linscale*: This allows the linear range (`-linthresh` to `linthresh`) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when `linscale == 1.0` (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range. Defaults to 1.

```
autoscale(A)
    Set vmin, vmax to min, max of A.
```

```
autoscale_None(A)
    autoscale only None-valued vmin or vmax.
```

```
inverse(value)
```

#### Examples using `matplotlib.colors.SymLogNorm`

- `sphx_glr_gallery_userdemo_colormap_normalizations.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations_symlognorm.py`
- [Colormap Normalization](#)

---

**Functions**

<code>from_levels_and_colors(levels, colors[, extend])</code>	A helper routine to generate a cmap and a norm instance which behave similar to <code>contourf</code> 's levels and colors arguments.
<code>hsv_to_rgb(hsv)</code>	convert hsv values in a numpy array to rgb values all values assumed to be in range [0, 1]
<code>rgb_to_hsv(arr)</code>	convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.
<code>to_hex(c[, keep_alpha])</code>	Convert <code>c</code> to a hex color.
<code>to_rgb(c)</code>	Convert <code>c</code> to an RGB color, silently dropping the alpha channel.
<code>to_rgba(c[, alpha])</code>	Convert <code>c</code> to an RGBA color.
<code>to_rgba_array(c[, alpha])</code>	Convert <code>c</code> to a (n, 4) array of RGBA colors.
<code>is_color_like(c)</code>	Return whether <code>c</code> can be interpreted as an RGB(A) color.
<code>makeMappingArray(N, data[, gamma])</code>	Create an $N$ -element 1-d lookup table
<code>get_named_colors_mapping()</code>	Return the global mapping of names to named colors.

**matplotlib.colors.from\_levels\_and\_colors**

`matplotlib.colors.from_levels_and_colors(levels, colors, extend='neither')`

A helper routine to generate a cmap and a norm instance which behave similar to `contourf`'s levels and colors arguments.

**Parameters**

**levels** [sequence of numbers] The quantization levels used to construct the *BoundaryNorm*. Values  $v$  are quantized to level  $i$  if  $lev[i] \leq v < lev[i+1]$ .

**colors** [sequence of colors] The fill color to use for each level. If `extend` is "neither" there must be `n_level - 1` colors. For an `extend` of "min" or "max" add one extra color, and for an `extend` of "both" add two colors.

**extend** [{'neither', 'min', 'max', 'both'}, optional] The behaviour when a value falls out of range of the given levels. See `contourf()` for details.

**Returns**

**(cmap, norm)** [tuple containing a *Colormap* and a *Normalize* instance]

**matplotlib.colors.hsv\_to\_rgb**

`matplotlib.colors.hsv_to_rgb(hsv)`

convert hsv values in a numpy array to rgb values all values assumed to be in range [0, 1]

**Parameters**

**hsv** [(..., 3) array-like] All values assumed to be in range [0, 1]

**Returns**

**rgb** [(..., 3) ndarray] Colors converted to RGB values in range [0, 1]

#### `matplotlib.colors.rgb_to_hsv`

`matplotlib.colors.rgb_to_hsv(arr)`  
convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.

##### **Parameters**

**arr** [(..., 3) array-like] All values must be in the range [0, 1]

##### **Returns**

**hsv** [(..., 3) ndarray] Colors converted to hsv values in range [0, 1]

#### **Examples using `matplotlib.colors.rgb_to_hsv`**

- `sphinx_glr_gallery_color_named_colors.py`

#### `matplotlib.colors.to_hex`

`matplotlib.colors.to_hex(c, keep_alpha=False)`  
Convert *c* to a hex color.

Uses the `#rrggbb` format if *keep\_alpha* is `False` (the default), `#rrggbbaa` otherwise.

#### `matplotlib.colors.to_rgb`

`matplotlib.colors.to_rgb(c)`  
Convert *c* to an RGB color, silently dropping the alpha channel.

#### `matplotlib.colors.to_rgba`

`matplotlib.colors.to_rgba(c, alpha=None)`  
Convert *c* to an RGBA color.

##### **Parameters**

**c** [Matplotlib color]

**alpha** [scalar, optional] If *alpha* is not `None`, it forces the alpha value, except if *c* is "none" (case-insensitive), which always maps to (0, 0, 0, 0).

##### **Returns**

**tuple** Tuple of (r, g, b, a) scalars.

**Examples using `matplotlib.colors.to_rgba`**

- `sphinx_glr_gallery_color_named_colors.py`
- `sphinx_glr_gallery_shapes_and_collections_collections.py`
- `sphinx_glr_gallery_shapes_and_collections_line_collection.py`
- `sphinx_glr_gallery_event_handling_lasso_demo.py`
- `sphinx_glr_gallery_misc_demo_ribbon_box.py`
- `sphinx_glr_gallery_mplot3d_polys3d.py`
- `sphinx_glr_gallery_widgets_menu.py`

**`matplotlib.colors.to_rgba_array`**

`matplotlib.colors.to_rgba_array(c, alpha=None)`  
Convert *c* to a (n, 4) array of RGBA colors.

If *alpha* is not `None`, it forces the alpha value. If *c* is "none" (case-insensitive) or an empty list, an empty array is returned.

**`matplotlib.colors.is_color_like`**

`matplotlib.colors.is_color_like(c)`  
Return whether *c* can be interpreted as an RGB(A) color.

**`matplotlib.colors.makeMappingArray`**

`matplotlib.colors.makeMappingArray(N, data, gamma=1.0)`  
Create an *N* -element 1-d lookup table

*data* represented by a list of x,y0,y1 mapping correspondences. Each element in this list represents how a value between 0 and 1 (inclusive) represented by *x* is mapped to a corresponding value between 0 and 1 (inclusive). The two values of *y* are to allow for discontinuous mapping functions (say as might be found in a sawtooth) where *y0* represents the value of *y* for values of *x*  $\leq$  to that given, and *y1* is the value to be used for *x*  $>$  than that given). The list must start with *x*=0, end with *x*=1, and all values of *x* must be in increasing order. Values between the given mapping points are determined by simple linear interpolation.

Alternatively, *data* can be a function mapping values between 0 - 1 to 0 - 1.

The function returns an array "result" where `result[x*(N-1)]` gives the closest value for values of *x* between 0 and 1.

**`matplotlib.colors.get_named_colors_mapping`**

`matplotlib.colors.get_named_colors_mapping()`  
Return the global mapping of names to named colors.

## 18.16 contour

### 18.16.1 matplotlib.contour

These are classes to support contour plotting and labelling for the Axes class.

```
class matplotlib.contour.ClabelText(x=0, y=0, text="", color=None, verticalalign=
    'baseline', horizontalalignment='left',
    multialignment=None, fontproperties=None,
    rotation=None, linespacing=None, rota-
    tion_mode=None, usetex=None, wrap=False,
    **kwargs)
```

Bases: `matplotlib.text.Text`

Unlike the ordinary text, the `get_rotation` returns an updated angle in the pixel coordinate assuming that the input rotation is an angle in data coordinate (or whatever transform set).

Create a `Text` instance at `x`, `y` with string `text`.

Valid kwargs are

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	float
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <code>patches.FancyBboxPatch</code>
<code>clip_box</code>	<code>matplotlib.transforms.Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	{ ( <code>path.Path</code> , <code>transforms.Transform</code> ), <code>patches.Patch</code> , None }
<code>color</code>	color
<code>contains</code>	callable
<code>figure</code>	<code>Figure</code>
<code>fontfamily</code>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontname</code>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontproperties</code>	<code>font_manager.FontProperties</code>
<code>fontsize</code>	{size in points, 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}
<code>fontstretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'normal', 'expanded', 'extra-expanded', 'ultra-expanded'}
<code>fontstyle</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code>	{'normal', 'small-caps'}
<code>fontweight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'bold', 'extra-bold', 'black'}
<code>gid</code>	str
<code>horizontalalignment</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>multialignment</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool or None

Property	Description
<i>rotation</i>	{angle in degrees, 'vertical', 'horizontal'}
<i>rotation_mode</i>	{None, 'default', 'anchor'}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	string or object castable to string (but None becomes '')
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>usetex</i>	bool or None
<i>verticalalignment</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

`get_rotation()`  
Return the text angle as float in degrees.

`class matplotlib.contour.ContourLabeler`

Bases: `object`

Mixin to provide labelling capability to `ContourSet`.

`add_label(x, y, rotation, lev, cvalue)`  
Add contour label using `Text` class.

`add_label_clabeltext(x, y, rotation, lev, cvalue)`  
Add contour label using `ClabelText` class.

`add_label_near(x, y, inline=True, inline_spacing=5, transform=None)`  
Add a label near the point (x, y). If transform is None (default), (x, y) is in data coordinates; if transform is False, (x, y) is in display coordinates; otherwise, the specified transform will be used to translate (x, y) into display coordinates.

### Parameters

**x, y** [float] The approximate location of the label.

**inline** [bool, optional, default: True] If `True` remove the segment of the contour beneath the label.

**inline\_spacing** [int, optional, default: 5] Space in pixels to leave on each side of label when placing inline. This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

`calc_label_rot_and_inline(slc, ind, lw, lc=None, spacing=5)`

This function calculates the appropriate label rotation given the linecontour coordinates in screen units, the index of the label location and the label width.

It will also break contour and calculate inlining if `lc` is not empty (`lc` defaults to the empty list if None). `spacing` is the space around the label in pixels to leave empty.

Do both of these tasks at once to avoid calculating path lengths multiple times, which is relatively costly.

The method used here involves calculating the path length along the contour in pixel coordinates and then looking approximately label width / 2 away from central point to determine rotation and then to break contour if desired.

`cl`

Deprecated since version 3.0: The `<lambda>` function was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use `labelTexts` instead.

`cl_cvalues`

Deprecated since version 3.0: The `<lambda>` function was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use `labelCValues` instead.

`cl_xy`

Deprecated since version 3.0: The `<lambda>` function was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use `labelXYs` instead.

`clabel(*args, fontsize=None, inline=True, inline_spacing=5, fmt='%1.3f', colors=None, use_clabeltext=False, manual=False, rightside_up=True)`

Label a contour plot.

Call signature:

```
clabel(cs, [levels,] **kwargs)
```

Adds labels to line contours in `cs`, where `cs` is a `ContourSet` object returned by `contour()`.

### Parameters

**cs** [`ContourSet`] The `ContourSet` to label.

**levels** [array-like, optional] A list of level values, that should be labeled. The list must be a subset of `cs.levels`. If not given, all levels are labeled.

**fontsize** [string or float, optional] Size in points or relative size e.g., 'smaller', 'x-large'. See `Text.set_size` for accepted string values.

**colors** [color-spec, optional] The label colors:

- If `None`, the color of each label matches the color of the corresponding contour.
- If one string color, e.g., `colors = 'r'` or `colors = 'red'`, all labels will be plotted in this color.
- If a tuple of matplotlib color args (string, float, rgb, etc), different labels will be plotted in different colors in the order specified.

**inline** [bool, optional] If `True` the underlying contour is removed where the label is placed. Default is `True`.

**inline\_spacing** [float, optional] Space in pixels to leave on each side of label when placing inline. Defaults to 5.

This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

**fmt** [string or dict, optional] A format string for the label. Default is `'%1.3f'`

Alternatively, this can be a dictionary matching contour levels with arbitrary strings to use for each contour level (i.e., `fmt[level]=string`), or

it can be any callable, such as a *Formatter* instance, that returns a string when called with a numeric contour level.

**manual** [bool or iterable, optional] If `True`, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).

*manual* can also be an iterable object of x,y tuples. Contour labels will be created as if mouse is clicked at each x,y positions.

**rightside\_up** [bool, optional] If `True`, label rotations will always be plus or minus 90 degrees from level. Default is `True`.

**use\_clabeltext** [bool, optional] If `True`, *ClabelText* class (instead of *Text*) is used to create labels. *ClabelText* recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes. Default is `False`.

### Returns

**labels** A list of *Text* instances for the labels.

`get_label_coords(distances, XX, YY, ysize, lw)`

Return x, y, and the index of a label location.

Labels are plotted at a location with the smallest deviation of the contour from a straight line unless there is another label nearby, in which case the next best place on the contour is picked up. If all such candidates are rejected, the beginning of the contour is chosen.

`get_label_width(lev, fmt, fsize)`

Return the width of the label in points.

`get_real_label_width(lev, fmt, fsize)`

Deprecated since version 2.2: The `get_real_label_width` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

This computes actual onscreen label width. This uses some black magic to determine onscreen extent of non-drawn label. This magic may not be very robust.

This method is not being used, and may be modified or removed.

`get_text(lev, fmt)`

Get the text of the label.

`labels(inline, inline_spacing)`

`locate_label(linecontour, labelwidth)`

Find good place to draw a label (relatively flat part of the contour).

`pop_label(index=-1)`

Defaults to removing last label, but any index can be supplied

`print_label(linecontour, labelwidth)`

Return `False` if contours are too short for a label.

`set_label_props(label, text, color)`

Set the label properties - color, fontsize, text.

```
too_close(x, y, lw)
```

Return *True* if a label is already near this location.

```
class matplotlib.contour.ContourSet(ax, *args, levels=None, filled=False,
                                     linewidths=None, linestyles=None, alpha=None,
                                     origin=None, extent=None, cmap=None,
                                     colors=None, norm=None, vmin=None,
                                     vmax=None, extend='neither', antialiased=None,
                                     **kwargs)
```

Bases: *matplotlib.cm.ScalarMappable*, *matplotlib.contour.ContourLabeler*

Store a set of contour lines or filled regions.

User-callable method: *clabel*

### Parameters

**ax** [*Axes*]

**levels** [[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

**allsegs** [[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines  $\text{len}(\text{allsegs}) == \text{len}(\text{levels})$ , and for filled contour regions  $\text{len}(\text{allsegs}) = \text{len}(\text{levels}) - 1$ . The lists should look like:

```
level0segs = [polygon0, polygon1, ...]
polygon0 = array_like [[x0,y0], [x1,y1], ...]
```

**allkinds** [None or [level0kinds, level1kinds, ...]] Optional list of all the polygon vertex kinds (code types), as described and used in *Path*. This is used to allow multiply- connected paths such as holes within filled polygons. If not *None*,  $\text{len}(\text{allkinds}) == \text{len}(\text{allsegs})$ . The lists should look like:

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not *None*, usually all polygons for a particular contour level are grouped together so that  $\text{level0segs} = [\text{polygon0}]$  and  $\text{level0kinds} = [\text{polygon0kinds}]$ .

**kwargs** : Keyword arguments are as described in the docstring of *contour*.

### Attributes

**ax**: The axes object in which the contours are drawn.

**collections**: A *silent\_list* of *LineCollections* or *PolyCollections*.

**levels**: Contour levels.

**layers**: Same as *levels* for line contours; half-way between levels for filled contours. See *\_process\_colors()*.

Draw contour lines or filled regions, depending on whether keyword arg *filled* is *False* (default) or *True*.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

### Parameters

**ax** : The *Axes* object to draw on.

**levels** [[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

**allsegs** [[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines  $\text{len}(\text{allsegs}) == \text{len}(\text{levels})$ , and for filled contour regions  $\text{len}(\text{allsegs}) = \text{len}(\text{levels}) - 1$ . The lists should look like:

```
level0segs = [polygon0, polygon1, ...]
polygon0 = array_like [[x0,y0], [x1,y1], ...]
```

**allkinds** [[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply-connected paths such as holes within filled polygons. If not None,  $\text{len}(\text{allkinds}) == \text{len}(\text{allsegs})$ . The lists should look like:

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not None, usually all polygons for a particular contour level are grouped together so that  $\text{level0segs} = [\text{polygon0}]$  and  $\text{level0kinds} = [\text{polygon0kinds}]$ .

**\*\*kwargs** Keyword arguments are as described in the docstring of *contour*.

*changed*()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

*find\_nearest\_contour*(*x*, *y*, *indices=None*, *pixel=True*)

Finds contour that is closest to a point. Defaults to measuring distance in pixels (screen space - useful for manual contour labeling), but this can be controlled via a keyword argument.

Returns a tuple containing the contour, segment, index of segment, x & y of segment point and distance to minimum point.

Optional keyword arguments:

***indices***: Indexes of contour levels to consider when looking for nearest point. Defaults to using all levels.

***pixel***: If *True*, measure distance in pixel space, if not, measure distance in axes space. Defaults to *True*.

*get\_alpha*()

returns alpha to be applied to all ContourSet artists

*get\_transform*()

Return the *Transform* instance used by this ContourSet.

*legend\_elements*(*variable\_name='x'*, *str\_format=<class 'str'>*)

Return a list of artists and labels suitable for passing through to `plt.legend()` which represent this ContourSet.

The labels have the form "*0 < x <= 1*" stating the data ranges which the artists represent.

### Parameters

**variable\_name** [str] The string used inside the inequality used on the labels.

**str\_format** [function: float -> str] Function used to format the numbers in the labels.

### Returns

**artists** [List[*Artist*]] A list of the artists.

**labels** [List[str]] A list of the labels.

`set_alpha(alpha)`

Set the alpha blending value for all `ContourSet` artists. *alpha* must be between 0 (transparent) and 1 (opaque).

```
class matplotlib.contour.QuadContourSet(ax, *args, levels=None, filled=False,
                                         linewidths=None, linestyle=None, al-
                                         pha=None, origin=None, extent=None,
                                         cmap=None, colors=None, norm=None,
                                         vmin=None, vmax=None, extend='neither',
                                         antialiased=None, **kwargs)
```

Bases: `matplotlib.contour.ContourSet`

Create and store a set of contour lines or filled regions.

User-callable method: `clabel`

### Attributes

**ax**: The axes object in which the contours are drawn.

**collections**: A silent\_list of `LineCollections` or `PolyCollections`.

**levels**: Contour levels.

**layers**: Same as `levels` for line contours; half-way between levels for filled contours. See `_process_colors()` method.

Draw contour lines or filled regions, depending on whether keyword arg *filled* is `False` (default) or `True`.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

### Parameters

**ax** : The *Axes* object to draw on.

**levels** [[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

**allsegs** [[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like:

```
level0segs = [polygon0, polygon1, ...]
polygon0 = array_like [[x0,y0], [x1,y1], ...]
```

**allkinds** [[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in `Path`. This is

used to allow multiply- connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like:

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

**\*\*kwargs** Keyword arguments are as described in the docstring of `contour`.

## 18.17 container

### 18.17.1 matplotlib.container

```
class matplotlib.container.BarContainer(patches, errorbar=None, **kwargs)
```

Bases: `matplotlib.container.Container`

Container for the artists of bar plots (e.g. created by `Axes.bar`).

The container can be treated as a tuple of the *patches* themselves. Additionally, you can access these and further parameters by the attributes.

#### Attributes

**patches** [list of `Rectangle`] The artists of the bars.

**errorbar** [None or `ErrorbarContainer`] A container for the error bar artists if error bars are present. `None` otherwise.

```
class matplotlib.container.Container(kl, label=None)
```

Bases: `tuple`

Base class for containers.

Containers are classes that collect semantically related Artists such as the bars of a bar plot.

```
add_callback(func)
```

Adds a callback function that will be called whenever one of the Artist's properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

```
get_children()
```

```
get_label()
```

Get the label used for this artist in the legend.

```
pchanged()
```

Fire an event when property changed, calling all of the registered callbacks.

```
remove()
```

```
remove_callback(oid)
```

Remove a callback based on its *id*.

**See also:**

`add_callback()` For adding callbacks

`set_label(s)`

Set the label to `s` for auto legend.

### Parameters

**s** [string or anything printable with '%s' conversion.]

`set_remove_method(f)`

Deprecated since version 3.0: The `set_remove_method` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

```
class matplotlib.container.ErrorbarContainer(lines, has_xerr=False, has_yerr=False,  
                                             **kwargs)
```

Bases: `matplotlib.container.Container`

Container for the artists of error bars (e.g. created by `Axes.errorbar`).

The container can be treated as the `lines` tuple itself. Additionally, you can access these and further parameters by the attributes.

### Attributes

**lines** [tuple] Tuple of (`data_line`, `caplines`, `barlinecols`).

- `data_line` : `Line2D` instance of x, y plot markers and/or line.
- `caplines` : tuple of `Line2D` instances of the error bar caps.
- `barlinecols` : list of `LineCollection` with the horizontal and vertical error ranges.

**has\_xerr, has\_yerr** [bool] True if the errorbar has x/y errors.

```
class matplotlib.container.StemContainer(markerline_stemlines_baseline, **kwargs)
```

Bases: `matplotlib.container.Container`

Container for the artists created in a `Axes.stem()` plot.

The container can be treated like a namedtuple (`markerline`, `stemlines`, `baseline`).

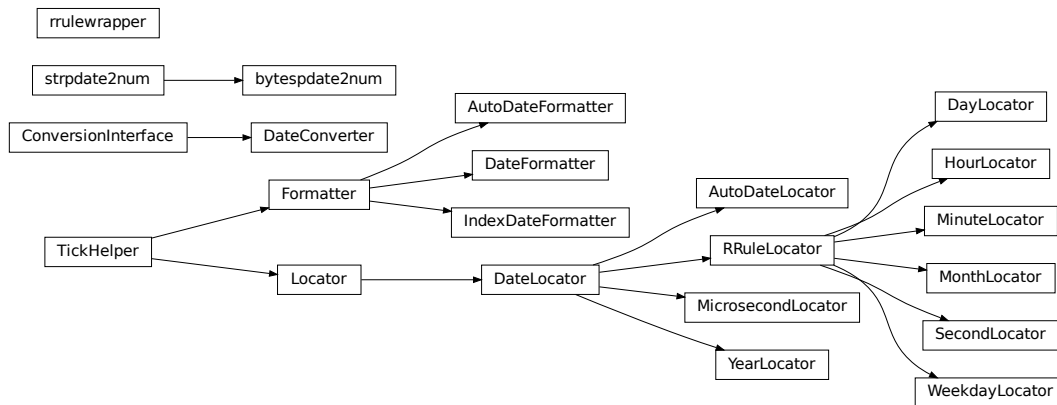

### Attributes

**markerline** [`Line2D`] The artist of the markers at the stem heads.

**stemlines** [list of `Line2D`] The artists of the vertical lines for all stems.

**baseline** [`Line2D`] The artist of the horizontal baseline.

## 18.18 dates

### 18.18.1 matplotlib.dates

Matplotlib provides sophisticated date plotting capabilities, standing on the shoulders of python `datetime` and the add-on module `dateutil`.

#### Matplotlib date format

Matplotlib represents dates using floating point numbers specifying the number of days since 0001-01-01 UTC, plus 1. For example, 0001-01-01, 06:00 is 1.25, not 0.25. Values < 1, i.e. dates before 0001-01-01 UTC are not supported.

There are a number of helper functions to convert between `datetime` objects and Matplotlib dates:

<code>date2num</code>	Convert <code>datetime</code> objects to Matplotlib dates.
<code>num2date</code>	Convert Matplotlib dates to <code>datetime</code> objects.
<code>num2timedelta</code>	Convert number of days to a <code>timedelta</code> object.
<code>epoch2num</code>	Convert an epoch or sequence of epochs to the new date format, that is days since 0001.
<code>num2epoch</code>	Convert days since 0001 to epoch.
<code>mx2num</code>	Convert <code>mx datetime</code> instance (or sequence of <code>mx</code> instances) to the new date format.
<code>drange</code>	Return a sequence of equally spaced Matplotlib dates.

**Note:** Like Python's `datetime`, `mpl` uses the Gregorian calendar for all conversions between dates and floating point numbers. This practice is not universal, and calendar differences can cause confusing differences between what Python and `mpl` give as the number of days since 0001-01-01 and what other software and databases yield. For example, the US Naval Observatory uses a calendar that switches from Julian to Gregorian in October, 1582. Hence, using their calculator, the number of days between 0001-01-01 and 2006-04-01 is 732403, whereas using the Gregorian calendar via the `datetime` module we find:

```
In [1]: date(2006, 4, 1).toordinal() - date(1, 1, 1).toordinal()
Out[1]: 732401
```

All the Matplotlib date converters, tickers and formatters are timezone aware. If no explicit timezone is provided, the `rcParam` `timezone` is assumed. If you want to use a custom time zone, pass a `datetime.tzinfo` instance with the `tz` keyword argument to `num2date()`, `plot_date()`, and any custom date tickers or locators you create.

A wide range of specific and general purpose date tick locators and formatters are provided in this module. See `matplotlib.ticker` for general information on tick locators and formatters. These are described below.

The `dateutil` module provides additional code to handle date ticking, making it easy to place ticks on any kinds of dates. See examples below.

## Date tickers

Most of the date tickers can locate single or multiple values. For example:

```
# import constants for the days of the week
from matplotlib.dates import MO, TU, WE, TH, FR, SA, SU

# tick on mondays every week
loc = WeekdayLocator(byweekday=MO, tz=tz)

# tick on mondays and saturdays
loc = WeekdayLocator(byweekday=(MO, SA))
```

In addition, most of the constructors take an `interval` argument:

```
# tick on mondays every second week
loc = WeekdayLocator(byweekday=MO, interval=2)
```

The `rrule` locator allows completely general date ticking:

```
# tick every 5th easter
rule = rrulewrapper(YEARLY, byeaster=1, interval=5)
loc = RRuleLocator(rule)
```

Here are all the date tickers:

- `MicrosecondLocator`: locate microseconds
- `SecondLocator`: locate seconds
- `MinuteLocator`: locate minutes
- `HourLocator`: locate hours

- *DayLocator*: locate specified days of the month
- *WeekdayLocator*: Locate days of the week, e.g., MO, TU
- *MonthLocator*: locate months, e.g., 7 for July
- *YearLocator*: locate years that are multiples of base
- *RRuleLocator*: locate using a `matplotlib.dates.rrulewrapper`. The `rrulewrapper` is a simple wrapper around a `dateutil.rrule` (`dateutil`) which allow almost arbitrary date tick specifications. See [rrule example](#).
- *AutoDateLocator*: On autoscale, this class picks the best *DateLocator* (e.g., *RRuleLocator*) to set the view limits and the tick locations. If called with `interval_multiples=True` it will make ticks line up with sensible multiples of the tick intervals. E.g. if the interval is 4 hours, it will pick hours 0, 4, 8, etc as ticks. This behaviour is not guaranteed by default.

## Date formatters

Here are all the date formatters:

- *AutoDateFormatter*: attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.
- *DateFormatter*: use `strftime()` format strings
- *IndexDateFormatter*: date plots with implicit x indexing.

`matplotlib.dates.date2num(d)`

Convert datetime objects to Matplotlib dates.

### Parameters

**d** [`datetime.datetime` or `numpy.datetime64` or sequences of these]

### Returns

**float or sequence of floats** Number of days (fraction part represents hours, minutes, seconds, ms) since 0001-01-01 00:00:00 UTC, plus one.

## Notes

The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details see the module docstring.

`matplotlib.dates.num2date(x, tz=None)`

Convert Matplotlib dates to `datetime` objects.

### Parameters

**x** [float or sequence of floats] Number of days (fraction part represents hours, minutes, seconds) since 0001-01-01 00:00:00 UTC, plus one.

**tz** [string, optional] Timezone of x (defaults to `rcparams.timezone`).

### Returns

**'~datetime.datetime' or sequence of '~datetime.datetime'** Dates are returned in timezone `tz`.

If x is a sequence, a sequence of `datetime` objects will be returned.

## Notes

The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

`matplotlib.dates.num2timedelta(x)`

Convert number of days to a `timedelta` object.

If `x` is a sequence, a sequence of `timedelta` objects will be returned.

### Parameters

**x** [float, sequence of floats] Number of days. The fraction part represents hours, minutes, seconds.

### Returns

**'datetime.timedelta' or list['datetime.timedelta']**

`matplotlib.dates.drange(dstart, dend, delta)`

Return a sequence of equally spaced Matplotlib dates.

The dates start at `dstart` and reach up to, but not including `dend`. They are spaced by `delta`.

### Parameters

**dstart, dend** [`datetime`] The date limits.

**delta** [`datetime.timedelta`] Spacing of the dates.

### Returns

**drange** [`numpy.array`] A list floats representing Matplotlib dates.

`matplotlib.dates.epoch2num(e)`

Convert an epoch or sequence of epochs to the new date format, that is days since 0001.

`matplotlib.dates.num2epoch(d)`

Convert days since 0001 to epoch. `d` can be a number or sequence.

`matplotlib.dates.mx2num(mxdates)`

Convert `mx` `datetime` instance (or sequence of `mx` instances) to the new date format.

`class matplotlib.dates.DateFormatter(fmt, tz=None)`

Bases: `matplotlib.ticker.Formatter`

Tick location is seconds since the epoch. Use a `strftime()` format string.

Python only supports `datetime.strftime()` formatting for years greater than 1900. Thanks to Andrew Dalke, Dalke Scientific Software who contributed the `strftime()` code below to include dates earlier than this year.

**fmt is a `strftime()` format string; tz is the `tzinfo` instance.**

```
illegal_s = re.compile('(^[~%])(%%)*%s')
```

```
set_tzinfo(tz)
```

```
strftime(dt, fmt=None)
```

Deprecated since version 3.0: The `strftime` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

Refer to documentation for `datetime.datetime.strftime()`

**fmt** is a `datetime.datetime.strftime()` format string.

Warning: For years before 1900, depending upon the current locale it is possible that the year displayed with %x might be incorrect. For years before 100, %y and %Y will yield zero-padded strings.

`strftime_pre_1900(dt, fmt=None)`

Deprecated since version 3.0: The `strftime_pre_1900` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

**Call `time.strftime` for years before 1900 by rolling** forward a multiple of 28 years.

`fmt` is a `strftime()` format string.

Dalke: I hope I did this math right. Every 28 years the calendar repeats, except through century leap years excepting the 400 year leap years. But only if you're using the Gregorian calendar.

```
class matplotlib.dates.IndexDateFormatter(t, fmt, tz=None)
```

Bases: `matplotlib.ticker.Formatter`

Use with `IndexLocator` to cycle format strings by index.

`t` is a sequence of dates (floating point days). `fmt` is a `strftime()` format string.

```
class matplotlib.dates.AutoDateFormatter(locator, tz=None, defaultfmt='%Y-%m-%d')
```

Bases: `matplotlib.ticker.Formatter`

This class attempts to figure out the best format to use. This is most useful when used with the `AutoDateLocator`.

The `AutoDateFormatter` has a scale dictionary that maps the scale of the tick (the distance in days between one major tick) and a format string. The default looks like this:

```
self.scaled = {
    DAYS_PER_YEAR: rcParams['date.autoformat.year'],
    DAYS_PER_MONTH: rcParams['date.autoformat.month'],
    1.0: rcParams['date.autoformat.day'],
    1. / HOURS_PER_DAY: rcParams['date.autoformat.hour'],
    1. / (MINUTES_PER_DAY): rcParams['date.autoformat.minute'],
    1. / (SEC_PER_DAY): rcParams['date.autoformat.second'],
    1. / (MUSECONDS_PER_DAY): rcParams['date.autoformat.microsecond'],
}
```

The algorithm picks the key in the dictionary that is  $\geq$  the current scale and uses that format string. You can customize this dictionary by doing:

```
>>> locator = AutoDateLocator()
>>> formatter = AutoDateFormatter(locator)
>>> formatter.scaled[1/(24.*60.)] = '%M:%S' # only show min and sec
```

A custom `FuncFormatter` can also be used. The following example shows how to use a custom format function to strip trailing zeros from decimal seconds and adds the date to the first ticklabel:

```
>>> def my_format_function(x, pos=None):
...     x = matplotlib.dates.num2date(x)
...     if pos == 0:
...         fmt = '%D %H:%M:%S.%f'
...     else:
...         fmt = '%H:%M:%S.%f'
```

(continues on next page)

(continued from previous page)

```

...     label = x.strftime(fmt)
...     label = label.rstrip("0")
...     label = label.rstrip(".")
...     return label
>>> from matplotlib.ticker import FuncFormatter
>>> formatter.scaled[1/(24.*60.)] = FuncFormatter(my_format_function)

```

Autoformat the date labels. The default format is the one to use if none of the values in `self.scaled` are greater than the unit returned by `locator._get_unit()`.

```
class matplotlib.dates.DateLocator(tz=None)
```

Bases: *matplotlib.ticker.Locator*

Determines the tick locations when plotting dates.

This class is subclassed by other Locators and is not meant to be used on its own.

*tz* is a `tzinfo` instance.

`datalim_to_dt()`

Convert axis data interval to datetime objects.

`hms0d = {'byhour': 0, 'byminute': 0, 'bysecond': 0}`

`nonsingular(vmin, vmax)`

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of  $\sim 0$ ).

`set_tzinfo(tz)`

Set time zone info.

`viewlim_to_dt()`

Converts the view interval to datetime objects.

```
class matplotlib.dates.RRRuleLocator(o, tz=None)
```

Bases: *matplotlib.dates.DateLocator*

`autoscale()`

Set the view limits to include the data range.

`static get_unit_generic(freq)`

`tick_values(vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```

>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]

```

```
class matplotlib.dates.AutoDateLocator(tz=None, minticks=5, maxticks=None, interval_multiples=True)
```

Bases: *matplotlib.dates.DateLocator*

On `autoscale`, this class picks the best *DateLocator* to set the view limits and the tick locations.

*minticks* is the minimum number of ticks desired, which is used to select the type of ticking (yearly, monthly, etc.).

*maxticks* is the maximum number of ticks desired, which controls any interval between ticks (ticking every other, every 3, etc.). For really fine-grained control, this can be a dictionary mapping individual rrule frequency constants (YEARLY, MONTHLY, etc.) to their own maximum number of ticks. This can be used to keep the number of ticks appropriate to the format chosen in *AutoDateFormatter*. Any frequency not specified in this dictionary is given a default value.

*tz* is a tzinfo instance.

*interval\_multiples* is a boolean that indicates whether ticks should be chosen to be multiple of the interval. This will lock ticks to 'nicer' locations. For example, this will force the ticks to be at hours 0,6,12,18 when hourly ticking is done at 6 hour intervals.

The *AutoDateLocator* has an interval dictionary that maps the frequency of the tick (a constant from *dateutil.rrule*) and a multiple allowed for that ticking. The default looks like this:

```
self.intervald = {
    YEARLY : [1, 2, 4, 5, 10, 20, 40, 50, 100, 200, 400, 500,
              1000, 2000, 4000, 5000, 10000],
    MONTHLY : [1, 2, 3, 4, 6],
    DAILY : [1, 2, 3, 7, 14],
    HOURLY : [1, 2, 3, 4, 6, 12],
    MINUTELY: [1, 5, 10, 15, 30],
    SECONDLY: [1, 5, 10, 15, 30],
    MICROSECONDLY: [1, 2, 5, 10, 20, 50, 100, 200, 500, 1000, 2000,
                    5000, 10000, 20000, 50000, 100000, 200000, 500000,
                    1000000],
}
```

The interval is used to specify multiples that are appropriate for the frequency of ticking. For instance, every 7 days is sensible for daily ticks, but for minutes/seconds, 15 or 30 make sense. You can customize this dictionary by doing:

```
locator = AutoDateLocator()
locator.intervald[HOURLY] = [3] # only show every 3 hours
```

*autoscale()*

Try to choose the view limits intelligently.

*get\_locator(dmin, dmax)*

Pick the best locator based on a distance.

*nonsingular(vmin, vmax)*

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of  $\sim 0$ ).

*refresh()*

Refresh internal information based on current limits.

*set\_axis(axis)*

*tick\_values(vmin, vmax)*

Return the values of the located ticks given **vmin** and **vmax**.

**Note:** To get tick locations with the *vmin* and *vmax* values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`class matplotlib.dates.YearLocator(base=1, month=1, day=1, tz=None)`

Bases: `matplotlib.dates.DateLocator`

Make ticks on a given day of each year that is a multiple of base.

Examples:

```
# Tick every year on Jan 1st
locator = YearLocator()

# Tick every 5 years on July 4th
locator = YearLocator(5, month=7, day=4)
```

Mark years that are multiple of base on a given month and day (default jan 1).

`autoscale()`

Set the view limits to include the data range.

`tick_values(vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`class matplotlib.dates.MonthLocator(bymonth=None, bymonthday=1, interval=1, tz=None)`

Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurrences of each month, e.g., 1, 3, 12.

Mark every month in `bymonth`; `bymonth` can be an int or sequence. Default is `range(1, 13)`, i.e. every month.

`interval` is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

`class matplotlib.dates.WeekdayLocator(byweekday=1, interval=1, tz=None)`

Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurrences of each weekday.

Mark every weekday in `byweekday`; `byweekday` can be a number or sequence.

Elements of `byweekday` must be one of MO, TU, WE, TH, FR, SA, SU, the constants from `dateutil.rrule`, which have been imported into the `matplotlib.dates` namespace.

`interval` specifies the number of weeks to skip. For example, `interval=2` plots every second week.

---

```
class matplotlib.dates.DayLocator(bymonthday=None, interval=1, tz=None)
```

```
    Bases: matplotlib.dates.RRuleLocator
```

Make ticks on occurrences of each day of the month. For example, 1, 15, 30.

Mark every day in *bymonthday*; *bymonthday* can be an int or sequence.

Default is to tick every day of the month: `bymonthday=range(1,32)`

```
class matplotlib.dates.HourLocator(byhour=None, interval=1, tz=None)
```

```
    Bases: matplotlib.dates.RRuleLocator
```

Make ticks on occurrences of each hour.

Mark every hour in *byhour*; *byhour* can be an int or sequence. Default is to tick every hour: `byhour=range(24)`

*interval* is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

```
class matplotlib.dates.MinuteLocator(byminute=None, interval=1, tz=None)
```

```
    Bases: matplotlib.dates.RRuleLocator
```

Make ticks on occurrences of each minute.

Mark every minute in *byminute*; *byminute* can be an int or sequence. Default is to tick every minute: `byminute=range(60)`

*interval* is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

```
class matplotlib.dates.SecondLocator(bysecond=None, interval=1, tz=None)
```

```
    Bases: matplotlib.dates.RRuleLocator
```

Make ticks on occurrences of each second.

Mark every second in *bysecond*; *bysecond* can be an int or sequence. Default is to tick every second: `bysecond = range(60)`

*interval* is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

```
class matplotlib.dates.MicrosecondLocator(interval=1, tz=None)
```

```
    Bases: matplotlib.dates.DateLocator
```

Make ticks on regular intervals of one or more microsecond(s).

---

**Note:** Due to the floating point representation of time in days since 0001-01-01 UTC (plus 1), plotting data with microsecond time resolution does not work well with current dates.

If you want microsecond resolution time plots, it is strongly recommended to use floating point seconds, not datetime-like time representation.

If you really must use `datetime.datetime()` or similar and still need microsecond precision, your only chance is to use very early years; using year 0001 is recommended.

---

*interval* is the interval between each iteration. For example, if `interval=2`, mark every second microsecond.

```
set_axis(axis)
```

```
set_data_interval(vmin, vmax)
```

```
set_view_interval(vmin, vmax)
```

```
tick_values(vmin, vmax)
```

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```
class matplotlib.dates.rrule(freq, dtstart=None, interval=1, wkst=None,
                             count=None, until=None, bysetpos=None, by-
                             month=None, bymonthday=None, byyearday=None,
                             byeaster=None, byweekno=None, byweekday=None,
                             byhour=None, byminute=None, bysecond=None,
                             cache=False)
```

Bases: `dateutil.rrule.rrulebase`

That's the base of the `rrule` operation. It accepts all the keywords defined in the RFC as its constructor parameters (except `byday`, which was renamed to `byweekday`) and more. The constructor prototype is:

```
rrule(freq)
```

Where `freq` must be one of `YEARLY`, `MONTHLY`, `WEEKLY`, `DAILY`, `HOURLY`, `MINUTELY`, or `SECONDLY`.

---

**Note:** Per RFC section 3.3.10, recurrence instances falling on invalid dates and times are ignored rather than coerced:

Recurrence rules may generate recurrence instances with an invalid date (e.g., February 30) or nonexistent local time (e.g., 1:30 AM on a day where the local time is moved forward by an hour at 1:00 AM). Such recurrence instances **MUST** be ignored and **MUST NOT** be counted as part of the recurrence set.

This can lead to possibly surprising behavior when, for example, the start date occurs at the end of the month:

```
>>> from dateutil.rrule import rrule, MONTHLY
>>> from datetime import datetime
>>> start_date = datetime(2014, 12, 31)
>>> list(rrule(freq=MONTHLY, count=4, dtstart=start_date))
...
[datetime.datetime(2014, 12, 31, 0, 0),
 datetime.datetime(2015, 1, 31, 0, 0),
 datetime.datetime(2015, 3, 31, 0, 0),
 datetime.datetime(2015, 5, 31, 0, 0)]
```

Additionally, it supports the following keyword arguments:

### Parameters

- `dtstart` - The recurrence start. Besides being the base for the recurrence, missing parameters in the final recurrence instances will also be extracted from this date. If not given, `datetime.now()` will be used instead.
- `interval` - The interval between each `freq` iteration. For example, when using `YEARLY`, an interval of 2 means once every two years, but with `HOURLY`, it means once every two hours. The default interval is 1.
- `wkst` - The week start day. Must be one of the `MO`, `TU`, `WE` constants, or an integer, specifying the first day of the week. This will affect recurrences based on weekly periods. The default week start is got from `calendar.firstweekday()`, and may be modified by `calendar.setfirstweekday()`.
- `count` - How many occurrences will be generated.

---

**Note:** As of version 2.5.0, the use of the `until` keyword together with the `count` keyword is deprecated per RFC-5545 Sec. 3.3.10.

---

- `until` - If given, this must be a `datetime` instance, that will specify the limit of the recurrence. The last recurrence in the rule is the greatest `datetime` that is less than or equal to the value specified in the `until` parameter.

---

**Note:** As of version 2.5.0, the use of the `until` keyword together with the `count` keyword is deprecated per RFC-5545 Sec. 3.3.10.

---

- `bysetpos` - If given, it must be either an integer, or a sequence of integers, positive or negative. Each given integer will specify an occurrence number, corresponding to the `nth` occurrence of the rule inside the frequency period. For example, a `bysetpos` of -1 if combined with a `MONTHLY` frequency, and a `byweekday` of (`MO`, `TU`, `WE`, `TH`, `FR`), will result in the last work day of every month.
- `bymonth` - If given, it must be either an integer, or a sequence of integers, meaning the months to apply the recurrence to.
- `bymonthday` - If given, it must be either an integer, or a sequence of integers, meaning the month days to apply the recurrence to.
- `byyearday` - If given, it must be either an integer, or a sequence of integers, meaning the year days to apply the recurrence to.
- `byeaster` - If given, it must be either an integer, or a sequence of integers, positive or negative. Each integer will define an offset from the Easter Sunday. Passing the offset 0 to `byeaster` will yield the Easter Sunday itself. This is an extension to the RFC specification.
- `byweekno` - If given, it must be either an integer, or a sequence of integers, meaning the week numbers to apply the recurrence to. Week numbers have the meaning described in ISO8601, that is, the first week of the year is that containing at least four days of the new year.
- `byweekday` - If given, it must be either an integer (0 == `MO`), a sequence of integers, one of the weekday constants (`MO`, `TU`, etc), or a sequence

of these constants. When given, these variables will define the weekdays where the recurrence will be applied. It's also possible to use an argument `n` for the weekday instances, which will mean the `n`th occurrence of this weekday in the period. For example, with `MONTHLY`, or with `YEARLY` and `BYMONTH`, using `FR(+1)` in `byweekday` will specify the first friday of the month where the recurrence happens. Notice that in the RFC documentation, this is specified as `BYDAY`, but was renamed to avoid the ambiguity of that keyword.

- `byhour` - If given, it must be either an integer, or a sequence of integers, meaning the hours to apply the recurrence to.
- `byminute` - If given, it must be either an integer, or a sequence of integers, meaning the minutes to apply the recurrence to.
- `bysecond` - If given, it must be either an integer, or a sequence of integers, meaning the seconds to apply the recurrence to.
- `cache` - If given, it must be a boolean value specifying to enable or disable caching of results. If you will use the same `rrule` instance multiple times, enabling caching will improve the performance considerably.

`replace(**kwargs)`

Return new `rrule` with same attributes except for those attributes given new values by whichever keyword arguments are specified.

```
class matplotlib.dates.relativedelta(dt1=None, dt2=None, years=0, months=0,
                                     days=0, leapdays=0, weeks=0, hours=0,
                                     minutes=0, seconds=0, microseconds=0,
                                     year=None, month=None, day=None, week-
                                     day=None, yearday=None, nlyearday=None,
                                     hour=None, minute=None, second=None, mi-
                                     crosecond=None)
```

Bases: `object`

The `relativedelta` type is based on the specification of the excellent work done by M.-A. Lemburg in his `mx.DateTime` extension. However, notice that this type does *NOT* implement the same algorithm as his work. Do *NOT* expect it to behave like `mx.DateTime`'s counterpart.

There are two different ways to build a `relativedelta` instance. The first one is passing it two `date/datetime` classes:

```
relativedelta(datetime1, datetime2)
```

The second one is passing it any number of the following keyword arguments:

```
relativedelta(arg1=x, arg2=y, arg3=z...)
```

`year, month, day, hour, minute, second, microsecond:`

Absolute information (argument `is` singular); adding `or` subtracting a `relativedelta` `with` absolute information does `not` perform an arithmetic operation, but rather `REPLACES` the corresponding value `in` the original `datetime` `with` the value(s) `in` `relativedelta`.

`years, months, weeks, days, hours, minutes, seconds, microseconds:`

Relative information, may be negative (argument `is` plural); adding `or` subtracting a `relativedelta` `with` relative information performs the corresponding arithmetic operation on the original `datetime` value

(continues on next page)

(continued from previous page)

```

with the information in the relativedelta.

weekday:
    One of the weekday instances (MO, TU, etc). These
    instances may receive a parameter N, specifying the Nth
    weekday, which could be positive or negative (like MO(+1)
    or MO(-2)). Not specifying it is the same as specifying
    +1. You can also use an integer, where 0=MO. Notice that
    if the calculated date is already Monday, for example,
    using MO(1) or MO(-1) won't change the day.

leapdays:
    Will add given days to the date found, if year is a leap
    year, and the date found is post 28 of february.

yearday, nlyearday:
    Set the yearday or the non-leap year day (jump leap days).
    These are converted to day/month/leapdays information.

```

There are relative and absolute forms of the keyword arguments. The plural is relative, and the singular is absolute. For each argument in the order below, the absolute form is applied first (by setting each attribute to that value) and then the relative form (by adding the value to the attribute).

The order of attributes considered when this relativedelta is added to a datetime is:

1. Year
2. Month
3. Day
4. Hours
5. Minutes
6. Seconds
7. Microseconds

Finally, weekday is applied, using the rule described above.

For example

```

>>> dt = datetime(2018, 4, 9, 13, 37, 0)
>>> delta = relativedelta(hours=25, day=1, weekday=MO(1))
datetime(2018, 4, 2, 14, 37, 0)

```

First, the day is set to 1 (the first of the month), then 25 hours are added, to get to the 2nd day and 14th hour, finally the weekday is applied, but since the 2nd is already a Monday there is no effect.

`normalized()`

Return a version of this object represented entirely using integer values for the relative attributes.

```

>>> relativedelta(days=1.5, hours=2).normalized()
relativedelta(days=1, hours=14)

```

**Returns** Returns a `dateutil.relativedelta.relativedelta` object.

weeks

`matplotlib.dates.seconds(s)`  
Return seconds as days.

`matplotlib.dates.minutes(m)`  
Return minutes as days.

`matplotlib.dates.hours(h)`  
Return hours as days.

`matplotlib.dates.weeks(w)`  
Return weeks as days.

## 18.19 dviread

### 18.19.1 matplotlib.dviread

A module for reading dvi files output by TeX. Several limitations make this not (currently) useful as a general-purpose dvi preprocessor, but it is currently used by the pdf backend for processing usetex text.

Interface:

```
with Dvi(filename, 72) as dvi:
    # iterate over pages:
    for page in dvi:
        w, h, d = page.width, page.height, page.descent
        for x, y, font, glyph, width in page.text:
            fontname = font.texname
            pointsize = font.size
            ...
        for x, y, height, width in page.bboxes:
            ...
```

`class matplotlib.dviread.Dvi(filename, dpi)`  
Bases: `object`

A reader for a dvi ("device-independent") file, as produced by TeX. The current implementation can only iterate through pages in order, and does not even attempt to verify the postamble.

This class can be used as a context manager to close the underlying file upon exit. Pages can be read via iteration. Here is an overly simple way to extract text without trying to detect whitespace:

```
>>> with matplotlib.dviread.Dvi('input.dvi', 72) as dvi:
...     for page in dvi:
...         print(''.join(chr(t.glyph) for t in page.text))
```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use `None` to return TeX's internal units.

`close()`  
Close the underlying file if it is open.

```
class matplotlib.dviread.DviFont(scale, tfm, texname, vf)
```

Bases: `object`

Encapsulation of a font that a DVI file can refer to.

This class holds a font's texname and size, supports comparison, and knows the widths of glyphs in the same units as the AFM file. There are also internal attributes (for use by `dviread.py`) that are *not* used for comparison.

The size is in Adobe points (converted from TeX points).

### Parameters

**scale** [float] Factor by which the font is scaled from its natural size.

**tfm** [Tfm] TeX font metrics for this font

**texname** [bytes] Name of the font as used internally by TeX and friends, as an ASCII bytestring. This is usually very different from any external font names, and `dviread.PsfontsMap` can be used to find the external name of the font.

**vf** [Vf] A TeX "virtual font" file, or None if this font is not virtual.

### Attributes

**texname** [bytes]

**size** [float] Size of the font in Adobe points, converted from the slightly smaller TeX points.

**widths** [list] Widths of glyphs in glyph-space units, typically 1/1000ths of the point size.

`size`

`texname`

`widths`

```
class matplotlib.dviread.Encoding(filename)
```

Bases: `object`

Parses a \*.enc file referenced from a psfonts.map style file. The format this class understands is a very limited subset of PostScript.

Usage (subject to change):

```
for name in Encoding(filename):
    whatever(name)
```

### Parameters

**filename** [string or bytestring]

### Attributes

**encoding** [list] List of character names

`encoding`

```
matplotlib.dviread.PsFont
```

alias of `matplotlib.dviread.Font`

```
class matplotlib.dviread.PsfontsMap
```

```
    Bases: object
```

A psfonts.map formatted file, mapping TeX fonts to PS fonts.

Usage:

```
>>> map = PsfontsMap(find_tex_file('pdftex.map'))
>>> entry = map[b'ptmbo8r']
>>> entry.texname
b'ptmbo8r'
>>> entry.psname
b'Times-Bold'
>>> entry.encoding
'/usr/local/texlive/2008/texmf-dist/fonts/enc/dvips/base/8r.enc'
>>> entry.effects
{'slant': 0.16700000000000001}
>>> entry.filename
```

### Parameters

**filename** [string or bytestring]

### Notes

For historical reasons, TeX knows many Type-1 fonts by different names than the outside world. (For one thing, the names have to fit in eight characters.) Also, TeX's native fonts are not Type-1 but Metafont, which is nontrivial to convert to PostScript except as a bitmap. While high-quality conversions to Type-1 format exist and are shipped with modern TeX distributions, we need to know which Type-1 fonts are the counterparts of which native fonts. For these reasons a mapping is needed from internal font names to font file names.

A texmf tree typically includes mapping files called e.g. psfonts.map, pdftex.map, or dvipdfm.map. The file psfonts.map is used by dvips, pdftex.map by pdfTeX, and dvipdfm.map by dvipdfm. psfonts.map might avoid embedding the 35 PostScript fonts (i.e., have no filename for them, as in the Times-Bold example above), while the pdf-related files perhaps only avoid the "Base 14" pdf fonts. But the user may have configured these files differently.

```
class matplotlib.dviread.Tfm(filename)
```

```
    Bases: object
```

A TeX Font Metric file.

This implementation covers only the bare minimum needed by the Dvi class.

### Parameters

**filename** [string or bytestring]

### Attributes

**checksum** [int] Used for verifying against the dvi file.

**design\_size** [int] Design size of the font (unknown units)

**width, height, depth** [dict] Dimensions of each character, need to be scaled by the factor specified in the dvi file. These are dicts because indexing may not start from 0.

checksum  
depth  
design\_size  
height  
width

class matplotlib.dviread.Vf(*filename*)

Bases: *matplotlib.dviread.Dvi*

A virtual font (\*.vf file) containing subroutines for dvi files.

Usage:

```
vf = Vf(filename)
glyph = vf[code]
glyph.text, glyph.bboxes, glyph.width
```

### Parameters

**filename** [string or bytestring]

### Notes

The virtual font format is a derivative of dvi: <http://mirrors.ctan.org/info/knuth/virtual-fonts> This class reuses some of the machinery of *Dvi* but replaces the `_read` loop and dispatch mechanism.

matplotlib.dviread.find\_tex\_file

Find a file in the texmf tree.

Calls `kpsewhich` which is an interface to the `kpathsea` library [1]. Most existing TeX distributions on Unix-like systems use `kpathsea`. It is also available as part of MikTeX, a popular distribution on Windows.

### Parameters

**filename** [string or bytestring]

**format** [string or bytestring] Used as the value of the `--format` option to `kpsewhich`. Could be e.g. 'tfm' or 'vf' to limit the search to that type of files.

### References

## 18.20 figure

### 18.20.1 matplotlib.figure

The figure module provides the top-level *Artist*, the *Figure*, which contains all the plot elements. The following classes are defined

*SubplotParams* control the default spacing of the subplots

*Figure* Top level container for all plot elements.

## Classes

<i>AxesStack</i>	Specialization of the <i>Stack</i> to handle all tracking of <i>Axes</i> in a <i>Figure</i> .
<i>Figure</i>	The top level container for all the plot elements.
<i>SubplotParams</i>	A class to hold the parameters for a subplot.

### matplotlib.figure.AxesStack

```
class matplotlib.figure.AxesStack
    Bases: matplotlib.cbook.Stack
```

Specialization of the *Stack* to handle all tracking of *Axes* in a *Figure*. This stack stores key, (ind, axes) pairs, where:

- **key** should be a hash of the args and kwargs used in generating the Axes.
- **ind** is a serial number for tracking the order in which axes were added.

The AxesStack is a callable, where `ax_stack()` returns the current axes. Alternatively the `current_key_axes()` will return the current key and associated axes.

```
add(key, a)
```

Add Axes *a*, with key *key*, to the stack, and return the stack.

If *key* is unhashable, replace it by a unique, arbitrary object.

If *a* is already on the stack, don't add it again, but return *None*.

```
as_list()
```

Return a list of the Axes instances that have been added to the figure.

```
bubble(a)
```

Move the given axes, which must already exist in the stack, to the top.

```
current_key_axes()
```

Return a tuple of (*key*, *axes*) for the active axes.

If no axes exists on the stack, then returns (None, None).

```
get(key)
```

Return the Axes instance that was added with *key*. If it is not present, return *None*.

```
remove(a)
```

Remove the axes from the stack.

**matplotlib.figure.Figure**

```
class matplotlib.figure.Figure(figsize=None, dpi=None, facecolor=None, edge-
                               color=None, linewidth=0.0, frameon=None,
                               subplotpars=None, tight_layout=None, con-
                               strained_layout=None)
```

Bases: *matplotlib.artist.Artist*

The top level container for all the plot elements.

The Figure instance supports callbacks through a *callbacks* attribute which is a *CallbackRegistry* instance. The events you can connect to are 'dpi\_changed', and the callback will be called with `func(fig)` where `fig` is the *Figure* instance.

**Attributes**

**patch** The *Rectangle* instance representing the figure patch.

**suppressComposite** For multiple figure images, the figure will make composite images depending on the renderer option `image_nocomposite` function. If *suppressComposite* is a boolean, this will override the renderer.

**Parameters**

**figsize** [2-tuple of floats, default: `rcParams["figure.figsize"]`] Figure dimension (width, height) in inches.

**dpi** [float, default: `rcParams["figure.dpi"]`] Dots per inch.

**facecolor** [default: `rcParams["figure.facecolor"]`] The figure patch facecolor.

**edgecolor** [default: `rcParams["figure.edgecolor"]`] The figure patch edgecolor.

**linewidth** [float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

**frameon** [bool, default: `rcParams["figure.frameon"]`] If False, suppress drawing the figure frame.

**subplotpars** [*SubplotParams*] Subplot parameters. If not given, the default subplot parameters `rcParams["figure.subplot.*"]` are used.

**tight\_layout** [bool or dict, default: `rcParams["figure.autolayout"]`] If False use *subplotpars*. If True adjust subplot parameters using *tight\_layout* with default padding. When providing a dict containing the keys `pad`, `w_pad`, `h_pad`, and `rect`, the default *tight\_layout* paddings will be overridden.

**constrained\_layout** [bool] If True use constrained layout to adjust positioning of plot elements. Like *tight\_layout*, but designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with `subplot()` or `subplot2grid()`.) Defaults to `rcParams["figure.constrained_layout.use"]`.

`add_artist(artist, clip=False)`

Add any *Artist* to the figure.

Usually artists are added to axes objects using `matplotlib.axes.Axes.add_artist()`, but use this method in the rare cases that adding directly to the figure is necessary.

### Parameters

**artist** [*Artist*] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transFigure`.

**clip** [bool, optional, default `False`] An optional parameter `clip` determines whether the added artist should be clipped by the figure patch. Default is *False*, i.e. no clipping.

### Returns

**artist** [The added *Artist*]

`add_axes(*args, **kwargs)`

Add an axes to the figure.

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

### Parameters

**rect** [sequence of float] The dimensions [left, bottom, width, height] of the new axes. All quantities are in fractions of figure width and height.

**projection** [{`None`, `'aitoff'`, `'hammer'`, `'lambert'`, `'mollweide'`, `'polar'`, `'rectilinear'`, str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default `None` results in a `'rectilinear'` projection.

**polar** [boolean, optional] If `True`, equivalent to `projection='polar'`.

**sharex, sharey** [*Axes*, optional] Share the x or y *axis* with `sharex` and/or `sharey`. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label** [str] A label for the returned axes.

### Returns

**axes** [*Axes* (or a subclass of *Axes*)] The returned axes class depends on the projection used. It is *Axes* if rectilinear projection are used and *projections.polar.PolarAxes* if polar projection are used.

### Other Parameters

**\*\*kwargs** This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

Property	Description
<code>adjustable</code>	{ <code>'box'</code> , <code>'datalim'</code> }
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
<code>alpha</code>	float

<i>yticks</i>	list
<i>zorder</i>	float

**See also:**

*Figure.add\_subplot*, *pyplot.subplot*, *pyplot.axes*, *Figure.subplots*, *pyplot.subplots*

## Notes

If the figure already has an axes with key (*args*, *kwargs*) then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, `add_axes` may be called with a single argument, a axes instance already created in the present figure but not in the figure's list of axes.

## Examples

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure(1)
fig.add_axes(rect,label=label1)
fig.add_axes(rect,label=label2)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax=fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

`add_axobserver(func)`

Whenever the axes state change, `func(self)` will be called.

`add_gridspec(nrows, ncols, **kwargs)`

Return a *GridSpec* that has this figure as a parent. This allows complex layout of axes in the figure.

### Parameters

**nrows** [int] Number of rows in grid.

**ncols** [int] Number or columns in grid.

### Returns

**gridspec** [*GridSpec*]

### Other Parameters

**\*kwargs\*** are passed to `'GridSpec'`.

**See also:**

`matplotlib.pyplot.subplots`

## Examples

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

`add_subplot(*args, **kwargs)`

Add an *Axes* to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
```

### Parameters

**\*args** Either a 3-digit integer or three separate integers describing the position of the subplot. If the three integers are *nrows*, *ncols*, and *index* in order, the subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right.

*pos* is a three digit integer, where the first digit is the number of rows, the second the number of columns, and the third the index of the subplot. i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that all integers must be less than 10 for this form to work.

**projection** [{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

**polar** [boolean, optional] If True, equivalent to `projection='polar'`.

**sharex, sharey** [*Axes*, optional] Share the x or y *axis* with `sharex` and/or `sharey`. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label** [str] A label for the returned axes.

### Returns

**axes** [an *axes.SubplotBase* subclass of *Axes* (or a subclass of *Axes*)] The axes of the subplot. The returned axes base class depends on the projection used. It is *Axes* if rectilinear projection are used and *projections.polar.PolarAxes* if polar projection are used. The returned axes is then a subplot subclass of the base class.

### Other Parameters

**\*\*kwargs** This method also takes the keyword arguments for the returned axes base class. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (
<i>alpha</i>	float
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto', 'equal'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[Axes, Renderer], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>contains</i>	callable
<i>facecolor</i>	color
<i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xbound</i>	(lower: float, upper: float)
<i>xlabel</i>	str
<i>xlim</i>	(left: float, right: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>xticklabels</i>	List[str]
<i>xticks</i>	list
<i>ybound</i>	(lower: float, upper: float)
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	List[str]
<i>yticks</i>	list
<i>zorder</i>	float

**See also:**

*Figure.add\_axes*, *pyplot.subplot*, *pyplot.axes*, *Figure.subplots*, *pyplot.subplots*

**Notes**

If the figure already has a subplot with key (*args*, *kwargs*) then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of *args* and *kwargs*. The axes *label* attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, *add\_subplot* may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure's list of axes.

**Examples**

```
fig=plt.figure(1)
fig.add_subplot(221)

# equivalent but more general
ax1=fig.add_subplot(2, 2, 1)

# add a subplot with no frame
ax2=fig.add_subplot(222, frameon=False)

# add a polar subplot
fig.add_subplot(223, projection='polar')

# add a red subplot that share the x-axis with ax1
fig.add_subplot(224, sharex=ax1, facecolor='red')

#delete ax2 from the figure
fig.delaxes(ax2)

#add ax2 to the figure again
fig.add_subplot(ax2)
```

`align_labels(axes=None)`

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

**Parameters**

**axes** [list of *Axes*] Optional list (or ndarray) of *Axes* to align the labels. Default is to align all axes on the figure.

**See also:**

*matplotlib.figure.Figure.align\_xlabels*, *matplotlib.figure.Figure.align\_ylabels*

`align_xlabels(axes=None)`

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on axes with the same top-most row.

### Parameters

**axes** [list of *Axes*] Optional list of (or ndarray) *Axes* to align the xlabels. Default is to align all axes on the figure.

### See also:

*matplotlib.figure.Figure.align\_ylabels*, *matplotlib.figure.Figure.align\_labels*

### Notes

This assumes that *axes* are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

### Examples

Example with rotated xtick labels:

```
fig, axes = plt.subplots(1, 2)
for tick in axes[0].get_xticklabels():
    tick.set_rotation(55)
axes[0].set_xlabel('XLabel 0')
axes[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

`align_ylabels(axes=None)`

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on axes with the same right-most column.

### Parameters

**axes** [list of *Axes*] Optional list (or ndarray) of *Axes* to align the ylabels. Default is to align all axes on the figure.

### See also:

*matplotlib.figure.Figure.align\_xlabels*, *matplotlib.figure.Figure.align\_labels*

## Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

## Examples

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

`autofmt_xdate(bottom=0.2, rotation=30, ha='right', which=None)`

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared xaxes where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

### Parameters

**bottom** [scalar] The bottom of the subplots for `subplots_adjust()`.

**rotation** [angle in degrees] The rotation of the xtick labels.

**ha** [string] The horizontal alignment of the xticklabels.

**which** [{None, 'major', 'minor', 'both'}] Selects which ticklabels to rotate. Default is None which works the same as major.

### axes

List of axes in the Figure. You can access the axes in the Figure through this list. Do not modify the list itself. Instead, use `add_axes`, `subplot` or `delaxes` to add or remove an axes.

`clear(keep_observers=False)`

Clear the figure - synonym for `clf()`.

`clf(keep_observers=False)`

Clear the figure.

Set `keep_observers` to True if, for example, a gui widget is tracking the axes in the figure.

`colorbar(mappable, cax=None, ax=None, use_gridspec=True, **kw)`

Create a colorbar for a `ScalarMappable` instance, `mappable`.

Documentation for the `pyplot` thin wrapper:

Add a colorbar to a plot.

Function signatures for the `pyplot` interface; all but the first are also method signatures for the `colorbar()` method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

## Parameters

**mappable** : The Image, *ContourSet*, etc. to which the colorbar applies; this argument is mandatory for the Figure *colorbar()* method but optional for the pyplot *colorbar()* function, which sets the default to the current image.

**cax** [*Axes* object, optional] Axes into which the colorbar will be drawn.

**ax** [*Axes*, list of Axes, optional] Parent axes from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

**use\_gridspec** [bool, optional] If *cax* is None, a new *cax* is created as an instance of Axes. If *ax* is an instance of Subplot and *use\_gridspec* is True, *cax* is created as an instance of Subplot using the *grid\_spec* module.

## Returns

**:class:'~matplotlib.colorbar.Colorbar' instance** See also its base class, *ColorbarBase*. Call the *set\_label()* method to label the colorbar.

## Notes

Additional keyword arguments are of two kinds:

axes properties:

Property	Description
<i>orientation</i>	vertical or horizontal
<i>fraction</i>	0.15; fraction of original axes to use for colorbar
<i>pad</i>	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
<i>shrink</i>	1.0; fraction by which to multiply the size of the colorbar
<i>aspect</i>	20; ratio of long to short dimensions
<i>anchor</i>	(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes
<i>parent_anchor</i>	(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged

colorbar properties:

Property	Description
<i>extend</i>	[ 'neither'   'both'   'min'   'max' ] If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap <code>set_under</code> and <code>set_over</code> methods.
<i>extendfrac</i>	[ <i>None</i>   'auto'   length   lengths ] If set to <i>None</i> , both the minimum and maximum triangular colorbar extensions with have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when <i>spacing</i> is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when <i>spacing</i> is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
<i>extendrect</i>	bool If <i>False</i> the minimum and maximum colorbar extensions will be triangular (the default). If <i>True</i> the extensions will be rectangular.
<i>spacing</i>	[ 'uniform'   'proportional' ] Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<i>ticks</i>	[ <i>None</i>   list of ticks   Locator object ] If <i>None</i> , ticks are determined automatically from the input.
<i>format</i>	[ <i>None</i>   format string   Formatter object ] If <i>None</i> , the <code>ScalarFormatter</code> is used. If a format string is given, e.g., '%.3f', that is used. An alternative <code>Formatter</code> object may be given instead.
<i>drawedges</i>	bool Whether to draw lines at color boundaries.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has `norm=NoNorm()`), or other unusual circumstances.

Property	Description
<i>boundaries</i>	<i>None</i> or a sequence
<i>values</i>	<i>None</i> or a sequence which must be of length 1 less than the sequence of <i>boundaries</i> . For each region delimited by adjacent entries in <i>boundaries</i> , the color mapped to the corresponding value in <i>values</i> will be used.

If *mappable* is a `ContourSet`, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified it determines the size of the colorbar and *shrink* and *aspect* kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects

in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewer (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers not matplotlib. As a workaround the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances. Particularly with semi transparent images ( $\alpha < 1$ ) and colorbar extensions and is not enabled by default see (issue #1188).

`contains(mouseevent)`

Test whether the mouse event occurred on the figure.

### Returns

**bool, {}**

`delaxes(ax)`

Remove the *Axes* `ax` from the figure and update the current axes.

`dpi`

The resolution in dots per inch.

`draw(renderer)`

Render the figure using `matplotlib.backend_bases.RendererBase` instance `renderer`.

`draw_artist(a)`

Draw `matplotlib.artist.Artist` instance `a` only. This is available only after the figure is drawn.

`execute_constrained_layout(renderer=None)`

Use `layoutbox` to determine pos positions within axes.

See also `set_constrained_layout_pads`.

`figimage(X, xo=0, yo=0, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, origin=None, resize=False, **kwargs)`

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on `origin`.

### Parameters

**X** The image data. This is an array of one of the following shapes:

- MxN: luminance (grayscale) values
- MxNx3: RGB values
- MxNx4: RGBA values

**xo, yo** [int] The x/y image offset in pixels.

**alpha** [None or float] The alpha blending value.

**norm** [`matplotlib.colors.Normalize`] A `Normalize` instance to map the luminance to the interval [0, 1].

**cmap** [str or `matplotlib.colors.Colormap`] The colormap to use. Default: `rcParams["image.cmap"]`.

**vmin, vmax** [scalar] If *norm* is not given, these values set the data limits for the colormap.

**origin** [{'upper', 'lower'}] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes. Defaults to `rcParams["image.origin"]`.

**resize** [bool] If *True*, resize the figure to match the given image size.

### Returns

:class:'matplotlib.image.FigureImage'

### Other Parameters

**\*\*kwargs** Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

### Notes

figimage complements the axes image (*imshow()*) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0,0,1,1].

Examples:

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

`gca(**kwargs)`

Get the current axes, creating one if necessary.

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
<code>alpha</code>	float
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or num
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<code>contains</code>	callable
<code>facecolor</code>	color
<code>fc</code>	color

Contin

Table 140 – continued from previous page

Property	Description
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xbound</i>	(lower: float, upper: float)
<i>xlabel</i>	str
<i>xlim</i>	(left: float, right: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>xticklabels</i>	List[str]
<i>xticks</i>	list
<i>ybound</i>	(lower: float, upper: float)
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	List[str]
<i>yticks</i>	list
<i>zorder</i>	float

**get\_axes()**

Return a list of axes in the Figure. You can access and modify the axes in the Figure through this list.

Do not modify the list itself. Instead, use *add\_axes*, *subplot* or *delaxes* to add or remove an axes.

Note: This is equivalent to the property *axes*.

**get\_children()**

Get a list of artists contained in the figure.

**get\_constrained\_layout()**

Return a boolean: True means constrained layout is being used.

See *Constrained Layout Guide*.

`get_constrained_layout_pads(relative=False)`

Get padding for `constrained_layout`.

Returns a list of `w_pad`, `h_pad` in inches and `wspace` and `hspace` as fractions of the subplot.

See *Constrained Layout Guide*.

### Parameters

**relative** [boolean] If `True`, then convert from inches to figure relative.

`get_default_bbox_extra_artists()`

`get_dpi()`

Return the resolution in dots per inch as a float.

`get_edgecolor()`

Get the edge color of the Figure rectangle.

`get_facecolor()`

Get the face color of the Figure rectangle.

`get_figheight()`

Return the figure height as a float.

`get_figwidth()`

Return the figure width as a float.

`get_frameon()`

Return whether the figure frame will be drawn.

`get_size_inches()`

Returns the current size of the figure in inches.

### Returns

**size** [ndarray] The size (width, height) of the figure in inches.

### See also:

`matplotlib.Figure.set_size_inches`

`get_tight_layout()`

Return whether *tight\_layout* is called when drawing.

`get_tightbbox(renderer, bbox_extra_artists=None)`

Return a (tight) bounding box of the figure in inches.

Artists that have `artist.set_in_layout(False)` are not included in the `bbox`.

### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**bbox\_extra\_artists** [list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of each axes are included in the tight bounding box.

### Returns

**bbox** [*BboxBase*] containing the bounding box (in figure inches).

`get_window_extent(*args, **kwargs)`

Return the figure bounding box in display space. Arguments are ignored.

```
ginput(n=1, timeout=30, show_clicks=True, mouse_add=1, mouse_pop=3,  
       mouse_stop=2)
```

Blocking call to interact with a figure.

Wait until the user clicks  $n$  times on the figure, and return the coordinates of each click in a list.

The buttons used for the various actions (adding points, removing points, terminating the inputs) can be overridden via the arguments `mouse_add`, `mouse_pop` and `mouse_stop`, that give the associated mouse button: 1 for left, 2 for middle, 3 for right.

### Parameters

**n** [int, optional, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

**timeout** [scalar, optional, default: 30] Number of seconds to wait before timing out. If zero or negative will never timeout.

**show\_clicks** [bool, optional, default: False] If True, show a red cross at the location of each click.

**mouse\_add** [int, one of (1, 2, 3), optional, default: 1 (left click)] Mouse button used to add points.

**mouse\_pop** [int, one of (1, 2, 3), optional, default: 3 (right click)] Mouse button used to remove the most recently added point.

**mouse\_stop** [int, one of (1, 2, 3), optional, default: 2 (middle click)] Mouse button used to stop input.

### Returns

**points** [list of tuples] A list of the clicked (x, y) coordinates.

### Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

```
init_layoutbox()
```

Initialize the layoutbox for use in `constrained_layout`.

```
legend(*args, **kwargs)
```

Place a legend on the figure.

To make a legend from existing artists on every axes:

```
legend()
```

To make a legend for a list of lines and labels:

```
legend( (line1, line2, line3),  
        ('label1', 'label2', 'label3'),  
        loc='upper right')
```

These can also be specified by keyword:

```

legend(handles=(line1, line2, line3),
       labels=('label1', 'label2', 'label3'),
       loc='upper right')

```

### Parameters

**handles** [sequence of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

**labels** [sequence of strings, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

### Returns

**:class:'matplotlib.legend.Legend' instance**

### Other Parameters

**loc** [int or string or pair of floats, default: `rcParams["legend.loc"]` ('best' for axes, 'upper right' for figures)] The location of the legend. Possible codes are:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

Alternatively can be a 2-tuple giving *x*, *y* of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

**bbox\_to\_anchor** [*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (*x*, *y*, width,

height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

- ncol** [integer] The number of columns that the legend has. Default is 1.
- prop** [None or *matplotlib.font\_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.
- fontsize** [int or float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] Controls the font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.
- numpoints** [None or int] The number of marker points in the legend when creating a legend entry for a *Line2D* (line). Default is None, which will take the value from *rcParams["legend.numpoints"]*.
- scatterpoints** [None or int] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot). Default is None, which will take the value from *rcParams["legend.scatterpoints"]*.
- scatteryoffsets** [iterable of floats] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5]. Default is [0.375, 0.5, 0.3125].
- markerscale** [None or int or float] The relative size of legend markers compared with the originally drawn ones. Default is None, which will take the value from *rcParams["legend.markerscale"]*.
- markerfirst** [bool] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label. Default is *True*.
- frameon** [None or bool] Control whether the legend should be drawn on a patch (frame). Default is None, which will take the value from *rcParams["legend.frameon"]*.
- fancybox** [None or bool] Control whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background. Default is None, which will take the value from *rcParams["legend.fancybox"]*.
- shadow** [None or bool] Control whether to draw a shadow behind the legend. Default is None, which will take the value from *rcParams["legend.shadow"]*.
- framealpha** [None or float] Control the alpha transparency of the legend's background. Default is None, which will take the value from

`rcParams["legend.framealpha"]`. If shadow is activated and *framealpha* is `None`, the default value is ignored.

**facecolor** [`None` or "inherit" or a color spec] Control the legend's background color. Default is `None`, which will take the value from `rcParams["legend.facecolor"]`. If "inherit", it will take `rcParams["axes.facecolor"]`.

**edgecolor** [`None` or "inherit" or a color spec] Control the legend's background patch edge color. Default is `None`, which will take the value from `rcParams["legend.edgecolor"]`. If "inherit", it will take `rcParams["axes.edgecolor"]`.

**mode** [{"expand", `None`}] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the legend's size).

**bbox\_transform** [`None` or `matplotlib.transforms.Transform`] The transform for the bounding box (`bbox_to_anchor`). For a value of `None` (default) the Axes' `transAxes` transform will be used.

**title** [`str` or `None`] The legend's title. Default is no title (`None`).

**title\_fontsize: str or None** The fontsize of the legend's title. Default is the default fontsize.

**borderpad** [`float` or `None`] The fractional whitespace inside the legend border. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.borderpad"]`.

**labelspacing** [`float` or `None`] The vertical space between the legend entries. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.labelspacing"]`.

**handlelength** [`float` or `None`] The length of the legend handles. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.handlelength"]`.

**handletextpad** [`float` or `None`] The pad between the legend handle and text. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.handletextpad"]`.

**borderaxespad** [`float` or `None`] The pad between the axes and legend border. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.borderaxespad"]`.

**columnspacing** [`float` or `None`] The spacing between columns. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.columnspacing"]`.

**handler\_map** [`dict` or `None`] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map()`.

## Notes

Not all kinds of artist are supported by the legend command. See [Legend guide](#) for details.

`savefig(fname, *, frameon=None, transparent=None, **kwargs)`  
 Save the current figure.

Call signature:

```
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The output formats available depend on the backend being used.

### Parameters

**fname** [str or file-like object] A string containing a path to a filename, or a Python file-like object, or possibly some backend-dependent object such as *PdfPages*.

If *format* is *None* and *fname* is a string, the output format is deduced from the extension of the filename. If the filename has no extension, `rcParams["savefig.format"]` is used.

If *fname* is not a string, remember to specify *format* to ensure that the correct backend is used.

### Other Parameters

**dpi** [[ *None* | scalar > 0 | 'figure' ]] The resolution in dots per inch. If *None*, defaults to `rcParams["savefig.dpi"]`. If 'figure', uses the figure's dpi value.

**quality** [[ *None* | 1 <= scalar <= 100 ]] The image quality, on a scale from 1 (worst) to 95 (best). Applicable only if *format* is jpg or jpeg, ignored otherwise. If *None*, defaults to `rcParams["savefig.jpeg_quality"]` (95 by default). Values above 95 should be avoided; 100 completely disables the JPEG quantization stage.

**facecolor** [color spec or None, optional] The facecolor of the figure; if *None*, defaults to `rcParams["savefig.facecolor"]`.

**edgecolor** [color spec or None, optional] The edgecolor of the figure; if *None*, defaults to `rcParams["savefig.edgecolor"]`

**orientation** [{'landscape', 'portrait'}] Currently only supported by the postscript backend.

**papertype** [str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

**format** [str] One of the file extensions supported by the active backend. Most backends support png, pdf, ps, eps and svg.

**transparent** [bool] If *True*, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

**frameon** [bool] If *True*, the figure patch will be colored, if *False*, the figure background will be transparent. If not provided, the rcParam 'savefig.frameon' will be used.

**bbox\_inches** [str or *Bbox*, optional] Bbox in inches. Only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure. If None, use `savefig.bbox`

**pad\_inches** [scalar, optional] Amount of padding around the figure when `bbox_inches` is 'tight'. If None, use `savefig.pad_inches`

**bbox\_extra\_artists** [list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

**metadata** [dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter `metadata` of *print\_png*.
- 'pdf' with pdf backend: See the parameter `metadata` of *PdfPages*.
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

`sca(a)`

Set the current axes to be `a` and return `a`.

`set_canvas(canvas)`

Set the canvas that contains the figure

#### Parameters

**canvas** [FigureCanvas]

`set_constrained_layout(constrained)`

Set whether `constrained_layout` is used upon drawing. If None, the `rcParams['figure.constrained_layout.use']` value will be used.

When providing a dict containing the keys `w_pad`, `h_pad` the default `constrained_layout` paddings will be overridden. These pads are in inches and default to 3.0/72.0. `w_pad` is the width padding and `h_pad` is the height padding.

See *Constrained Layout Guide*.

#### Parameters

**constrained** [bool or dict or None]

`set_constrained_layout_pads(**kwargs)`

Set padding for `constrained_layout`. Note the kwargs can be passed as a dictionary `fig.set_constrained_layout(**paddict)`.

See *Constrained Layout Guide*.

#### Parameters

**w\_pad** [scalar] Width padding in inches. This is the pad around axes and is meant to make sure there is enough room for fonts to look good. Defaults to 3 pts = 0.04167 inches

**h\_pad** [scalar] Height padding in inches. Defaults to 3 pts.

**wspace: scalar** Width padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being `w_pad + wspace`.

**hspace: scalar** Height padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being `h_pad + hspace`.

`set_dpi(val)`  
Set the resolution of the figure in dots-per-inch.

**Parameters**

**val** [float]

`set_edgecolor(color)`  
Set the edge color of the Figure rectangle.

**Parameters**

**color** [color]

`set_facecolor(color)`  
Set the face color of the Figure rectangle.

**Parameters**

**color** [color]

`set_figheight(val, forward=True)`  
Set the height of the figure in inches.

`set_figwidth(val, forward=True)`  
Set the width of the figure in inches.

`set_frameon(b)`  
Set whether the figure frame (background) is displayed or invisible.

**Parameters**

**b** [bool]

`set_size_inches(w, h=None, forward=True)`  
Set the figure size in inches.

Call signatures:

```
fig.set_size_inches(w, h) # OR
fig.set_size_inches((w, h))
```

optional kwarg `forward=True` will cause the canvas size to be automatically updated; e.g., you can resize the figure window from the shell

ACCEPTS: a (w, h) tuple with w, h in inches

**See also:**

`matplotlib.Figure.get_size_inches`

`set_tight_layout(tight)`  
Set whether and how `tight_layout` is called when drawing.

**Parameters**

**tight** [bool or dict with keys "pad", "w\_pad", "h\_pad", "rect" or None]  
If a bool, sets whether to call `tight_layout` upon drawing. If None, use the figure.autolayout rparam instead. If a dict, pass it as kwargs to `tight_layout`, overriding the default paddings.

`show(warn=True)`  
If using a GUI backend with pyplot, display the figure window.

If the figure was not created using `figure()`, it will lack a `FigureManagerBase`, and will raise an `AttributeError`.

## Parameters

**warn** [bool] If True, issue warning when called on a non-GUI backend

## Notes

For non-GUI backends, this does nothing, in which case a warning will be issued if *warn* is True (default).

`subplots(nrows=1, ncols=1, sharex=False, sharey=False, squeeze=True, subplot_kw=None, gridspec_kw=None)`  
Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

## Parameters

**nrows, ncols** [int, optional, default: 1] Number of rows/columns of the subplot grid.

**sharex, sharey** [bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick\_params*.

**squeeze** [bool, optional, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (*nrows=ncols=1*), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with  $N > 1$  and  $M > 1$  are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

**subplot\_kw** [dict, optional] Dict with keywords passed to the *add\_subplot()* call used to create each subplot.

**gridspec\_kw** [dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

## Returns

**ax** [*Axes* object or array of *Axes* objects.] *ax* can be either a single *Axes* object or an array of *Axes* objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the `squeeze` keyword, see above.

### Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
plt.figure(1, clear=True)

# Creates a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Creates two subplots and unpacks the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Creates four polar axes, and accesses them through the
# returned array
axes = fig.subplots(2, 2, subplot_kw=dict(polar=True))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

`subplots_adjust(left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)`

Update the *SubplotParams* with *kwargs* (defaulting to *rc* when *None*) and update the subplot locations.

`suptitle(t, **kwargs)`

Add a centered title to the figure.

### Parameters

**t** [str] The title text.

**x** [float, default 0.5] The x location of the text in figure coordinates.

**y** [float, default 0.98] The y location of the text in figure coordinates.

**horizontalalignment, ha** [{'center', 'left', 'right'}], default: 'center']  
The horizontal alignment of the text.

**verticalalignment, va** [{'top', 'center', 'bottom', 'baseline'}], default: 'top']  
The vertical alignment of the text.

**fontsize, size** [default: rcParams["figure.titlesize"]] The font size of the text. See *Text.set\_size* for possible values.

**fontweight, weight** [default: rcParams["figure.titleweight"]] The font weight of the text. See *Text.set\_weight* for possible values.

### Returns

**text** The *Text* instance of the title.

### Other Parameters

**fontproperties** [None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the FontProperties defaults. rcParams["figure.titlesize"] and rcParams["figure.titleweight"] are ignored in this case.

**\*\*kwargs** Additional kwargs are *matplotlib.text.Text* properties.

### Examples

```
>>> fig.suptitle('This is the figure title', fontsize=12)
```

`text(x, y, s, fontdict=None, withdash=False, **kwargs)`  
Add text to figure.

### Parameters

**x, y** [float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

**s** [str] The text string.

**fontdict** [dictionary, optional, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by your rc parameters. A property in *kwargs* override the same property in fontdict.

**withdash** [boolean, optional, default: False] Creates a *TextWithDash* instance instead of a *Text* instance.

### Returns

**text** [*Text*]

### Other Parameters

**\*\*kwargs** [*Text* properties] Other miscellaneous text parameters.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (n
<i>alpha</i>	float

Property	Description
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>matplotlib.transforms.Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	{ ( <i>path.Path</i> , <i>transforms.Transform</i> ), <i>patches.Patch</i> , None }
<i>color</i>	color
<i>contains</i>	callable
<i>figure</i>	<i>Figure</i>
<i>fontfamily</i>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<i>fontname</i>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<i>fontproperties</i>	<i>font_manager.FontProperties</i>
<i>fontsize</i>	{size in points, 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}
<i>fontstretch</i>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed'}
<i>fontstyle</i>	{'normal', 'italic', 'oblique'}
<i>fontvariant</i>	{'normal', 'small-caps'}
<i>fontweight</i>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'm'}
<i>gid</i>	str
<i>horizontalalignment</i>	{'center', 'right', 'left'}
<i>in_layout</i>	bool
<i>label</i>	object
<i>linespacing</i>	float (multiple of font size)
<i>multialignment</i>	{'left', 'right', 'center'}
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>position</i>	(float, float)
<i>rasterized</i>	bool or None
<i>rotation</i>	{angle in degrees, 'vertical', 'horizontal'}
<i>rotation_mode</i>	{None, 'default', 'anchor'}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	string or object castable to string (but None becomes '')
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>usetex</i>	bool or None
<i>verticalalignment</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

**See also:**

*Axes.text*, *pyplot.text*

**tight\_layout**(*renderer=None*, *pad=1.08*, *h\_pad=None*, *w\_pad=None*, *rect=None*)  
Automatically adjust subplot parameters to give specified padding.

To exclude an artist on the axes from the bounding box calculation that determines the subplot parameters (i.e. legend, or annotation), then set `a.set_in_layout(False)` for that artist.

## Parameters

**renderer** [subclass of *RendererBase*, optional] Defaults to the renderer for the figure.

**pad** [float, optional] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h\_pad, w\_pad** [float, optional] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to *pad*.

**rect** [tuple (left, bottom, right, top), optional] A rectangle (left, bottom, right, top) in the normalized figure coordinate that the whole subplots area (including labels) will fit into. Default is (0, 0, 1, 1).

### See also:

*Figure.set\_tight\_layout*, *pyplot.tight\_layout*

`waitforbuttonpress(timeout=-1)`

Blocking call to interact with the figure.

This will return True is a key was pressed, False if a mouse button was pressed and None if *timeout* was reached without either being pressed.

If *timeout* is negative, does not timeout.

**matplotlib.figure.SubplotParams**

```
class matplotlib.figure.SubplotParams(left=None, bottom=None, right=None,
                                     top=None, wspace=None, hspace=None)
```

Bases: `object`

A class to hold the parameters for a subplot.

All dimensions are fractions of the figure width or height. Defaults are given by `rcParams["figure.subplot.[name]"]`.

**Parameters**

**left** [float] The left side of the subplots of the figure.

**right** [float] The right side of the subplots of the figure.

**bottom** [float] The bottom of the subplots of the figure.

**top** [float] The top of the subplots of the figure.

**wspace** [float] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width.

**hspace** [float] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height.

```
update(left=None, bottom=None, right=None, top=None, wspace=None,
       hspace=None)
```

Update the dimensions of the passed parameters. *None* means unchanged.

**Examples using matplotlib.figure.SubplotParams**

- sphx\_glr\_gallery\_pyplots\_auto\_subplots\_adjust.py

**Functions**

---

*figaspect*

Calculate the width and height for a figure with a specified aspect ratio.

---

**matplotlib.figure.figaspect**

```
matplotlib.figure.figaspect(arg)
```

Calculate the width and height for a figure with a specified aspect ratio.

While the height is taken from `rcParams["figure.figsize"]`, the width is adjusted to match the desired aspect ratio. Additionally, it is ensured that the width is in the range [4., 16.] and the height is in the range [2., 16.]. If necessary, the default height is adjusted to ensure this.

**Parameters**

**arg** [scalar or 2d array] If a scalar, this defines the aspect ratio (i.e. the ratio height / width). In case of an array the aspect ratio is number of rows / number of columns, so that the array could be fitted in the figure undistorted.

## Returns

**width, height** The figure size in inches.

## Notes

If you want to create an axes within the figure, that still preserves the aspect ratio, be sure to create it with equal width and height. See examples below.

Thanks to Fernando Perez for this function.

## Examples

Make a figure twice as tall as it is wide:

```
w, h = figaspect(2.)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Make a figure with the proper aspect for an array:

```
A = rand(5,3)
w, h = figaspect(A)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

## 18.21 font\_manager

### 18.21.1 matplotlib.font\_manager

A module for finding, managing, and using fonts across platforms.

This module provides a single *FontManager* instance that can be shared across backends and platforms. The *findfont()* function returns the best TrueType (TTF) font file in the local or system font path that matches the specified *FontProperties* instance. The *FontManager* also handles Adobe Font Metrics (AFM) font files for use by the PostScript backend.

The design is based on the [W3C Cascading Style Sheet, Level 1 \(CSS1\) font specification](#). Future versions may implement the Level 2 or 2.1 specifications.

Experimental support is included for using `fontconfig` on Unix variant platforms (Linux, OS X, Solaris). To enable it, set the constant `USE_FONTCONFIG` in this file to `True`. `Fontconfig` has the advantage that it is the standard way to look up fonts on X11 platforms, so if a font is installed, it is much more likely to be found.

```
class matplotlib.font_manager.FontEntry(fname="", name="", style='normal',
                                       variant='normal', weight='normal',
                                       stretch='normal', size='medium')
```

Bases: `object`

A class for storing Font properties. It is used when populating the font lookup dictionary.

```
class matplotlib.font_manager.FontManager(size=None, weight='normal')
```

Bases: `object`

On import, the `FontManager` singleton instance creates a list of TrueType fonts based on the font properties: name, style, variant, weight, stretch, and size. The `findfont()` method does a nearest neighbor search to find the font that most closely matches the specification. If no good enough match is found, a default font is returned.

`afmfiles`

Deprecated since version 3.0: The `afmfiles` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

```
findfont(prop, fonttext='ttf', directory=None, fallback_to_default=True, re-  
build_if_missing=True)
```

Search the font list for the font that most closely matches the `FontProperties` `prop`.

`findfont()` performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

`directory`, if specified, will only return fonts from the given directory (or subdirectory of that directory).

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

If `fallback_to_default` is True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

See the [W3C Cascading Style Sheet, Level 1](#) documentation for a description of the font finding algorithm.

```
static get_default_size()
```

Return the default font size.

```
get_default_weight()
```

Return the default font weight.

```
score_family(families, family2)
```

Returns a match score between the list of font families in `families` and the font family name `family2`.

An exact match at the head of the list returns 0.0.

A match further down the list will return between 0 and 1.

No match will return 1.0.

```
score_size(size1, size2)
```

Returns a match score between `size1` and `size2`.

If `size2` (the size specified in the font file) is 'scalable', this function always returns 0.0, since any font size can be generated.

Otherwise, the result is the absolute distance between `size1` and `size2`, normalized so that the usual range of font sizes (6pt - 72pt) will lie between 0.0 and 1.0.

```
score_stretch(stretch1, stretch2)
```

Returns a match score between `stretch1` and `stretch2`.

The result is the absolute value of the difference between the CSS numeric values of `stretch1` and `stretch2`, normalized between 0.0 and 1.0.

`score_style(style1, style2)`

Returns a match score between *style1* and *style2*.

An exact match returns 0.0.

A match between 'italic' and 'oblique' returns 0.1.

No match returns 1.0.

`score_variant(variant1, variant2)`

Returns a match score between *variant1* and *variant2*.

An exact match returns 0.0, otherwise 1.0.

`score_weight(weight1, weight2)`

Returns a match score between *weight1* and *weight2*.

The result is 0.0 if both *weight1* and *weight2* are given as strings and have the same value.

Otherwise, the result is the absolute value of the difference between the CSS numeric values of *weight1* and *weight2*, normalized between 0.05 and 1.0.

`set_default_weight(weight)`

Set the default font weight. The initial value is 'normal'.

`ttfiles`

Deprecated since version 3.0: The `ttfiles` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

`update_fonts(filenamees)`

Update the font dictionary with new font files. Currently not implemented.

```
class matplotlib.font_manager.FontProperties(family=None, style=None, variant=None, weight=None, stretch=None, size=None, fname=None, _init=None)
```

Bases: `object`

A class for storing and manipulating font properties.

The font properties are those described in the [W3C Cascading Style Sheet, Level 1 font specification](#). The six properties are:

- **family:** A list of font names in decreasing order of priority. The items may include a generic font family name, either 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace'. In that case, the actual font to be used will be looked up from the associated `rcParam`.
- **style:** Either 'normal', 'italic' or 'oblique'.
- **variant:** Either 'normal' or 'small-caps'.
- **stretch:** A numeric value in the range 0-1000 or one of 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded'
- **weight:** A numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'
- **size:** Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12

The default font property for TrueType fonts (as specified in the default `rcParams`) is:

```
sans-serif, normal, normal, normal, normal, scalable.
```

Alternatively, a font may be specified using an absolute path to a .ttf file, by using the *fname* kwarg.

The preferred usage of font sizes is to use the relative values, e.g., 'large', instead of absolute font sizes, e.g., 12. This approach allows all text sizes to be made larger or smaller based on the font manager's default font size.

This class will also accept a `fontconfig` pattern, if it is the only argument provided. See the documentation on [fontconfig patterns](#). This support does not require fontconfig to be installed. We are merely borrowing its pattern syntax for use here.

Note that Matplotlib's internal font manager and fontconfig use a different algorithm to lookup fonts, so the results of the same pattern may be different in Matplotlib than in other applications that use fontconfig.

`copy()`

Return a deep copy of self

`get_family()`

Return a list of font names that comprise the font family.

`get_file()`

Return the filename of the associated font.

`get_fontconfig_pattern()`

Get a fontconfig pattern suitable for looking up the font as specified with fontconfig's `fc-match` utility.

See the documentation on [fontconfig patterns](#).

This support does not require fontconfig to be installed or support for it to be enabled. We are merely borrowing its pattern syntax for use here.

`get_name()`

Return the name of the font that best matches the font properties.

`get_size()`

Return the font size.

`get_size_in_points()`

`get_slant()`

Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_stretch()`

Return the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'.

`get_style()`

Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_variant()`

Return the font variant. Values are: 'normal' or 'small-caps'.

`get_weight()`

Set the font weight. Options are: A numeric value in the range 0-1000 or one of 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

`set_family(family)`

Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `text.usetex` is `True`.

`set_file(file)`

Set the filename of the fontfile to use. In this case, all other properties will be ignored.

`set_fontconfig_pattern(pattern)`

Set the properties by parsing a fontconfig *pattern*.

See the documentation on [fontconfig patterns](#).

This support does not require fontconfig to be installed or support for it to be enabled. We are merely borrowing its pattern syntax for use here.

`set_name(family)`

Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `text.usetex` is `True`.

`set_size(size)`

Set the font size. Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

`set_slant(style)`

Set the font style. Values are: 'normal', 'italic' or 'oblique'.

`set_stretch(stretch)`

Set the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded', or a numeric value in the range 0-1000.

`set_style(style)`

Set the font style. Values are: 'normal', 'italic' or 'oblique'.

`set_variant(variant)`

Set the font variant. Values are: 'normal' or 'small-caps'.

`set_weight(weight)`

Set the font weight. May be either a numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demi-bold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

```
class matplotlib.font_manager.JSONEncoder(*, skipkeys=False, ensure_ascii=True,
                                          check_circular=True, allow_nan=True,
                                          sort_keys=False, indent=None, separa-
                                          tors=None, default=None)
```

Bases: `json.encoder.JSONEncoder`

Constructor for JSONEncoder, with sensible defaults.

If `skipkeys` is false, then it is a `TypeError` to attempt encoding of keys that are not str, int, float or None. If `skipkeys` is True, such items are simply skipped.

If `ensure_ascii` is true, the output is guaranteed to be str objects with all incoming non-ASCII characters escaped. If `ensure_ascii` is false, the output can contain non-ASCII characters.

If `check_circular` is true, then lists, dicts, and custom encoded objects will be checked for circular references during encoding to prevent an infinite recursion (which would

cause an `OverflowError`). Otherwise, no such check takes place.

If `allow_nan` is true, then NaN, Infinity, and -Infinity will be encoded as such. This behavior is not JSON specification compliant, but is consistent with most JavaScript based encoders and decoders. Otherwise, it will be a `ValueError` to encode such floats.

If `sort_keys` is true, then the output of dictionaries will be sorted by key; this is useful for regression tests to ensure that JSON serializations can be compared on a day-to-day basis.

If `indent` is a non-negative integer, then JSON array elements and object members will be pretty-printed with that indent level. An indent level of 0 will only insert newlines. None is the most compact representation.

If specified, `separators` should be an (item\_separator, key\_separator) tuple. The default is (', ', ': ') if `indent` is None and (',', ': ') otherwise. To get the most compact JSON representation, you should specify (',', ':') to eliminate whitespace.

If specified, `default` is a function that gets called for objects that can't otherwise be serialized. It should return a JSON encodable version of the object or raise a `TypeError`.

`default(o)`

Implement this method in a subclass such that it returns a serializable object for `o`, or calls the base implementation (to raise a `TypeError`).

For example, to support arbitrary iterators, you could implement `default` like this:

```
def default(self, o):
    try:
        iterable = iter(o)
    except TypeError:
        pass
    else:
        return list(iterable)
    # Let the base class default method raise the TypeError
    return JSONEncoder.default(self, o)
```

`matplotlib.font_manager.OSXInstalledFonts(directories=None, fonttext='ttf')`  
Get list of font files on OS X.

`class matplotlib.font_manager.TempCache(**kwargs)`  
Bases: `object`

Deprecated since version 3.0: The `TempCache` class was deprecated in Matplotlib 3.0 and will be removed in 3.2.

A class to store temporary caches that are (a) not saved to disk and (b) invalidated whenever certain font-related `rcParams`—namely the family lookup lists—are changed or the font cache is reloaded. This avoids the expensive linear search through all fonts every time a font is looked up.

`get(prop)`

`invalidating_rcparams = ('font.serif', 'font.sans-serif', 'font.cursive', 'font.fantasy', 'font.monospace')`

`make_rcparams_key()`

`set(prop, value)`

`matplotlib.font_manager.afmFontProperty(fontpath, font)`  
Extract information from an AFM font file.

### Parameters

**font** [*AFM*] The AFM font file from which information will be extracted.

### Returns

**'FontEntry'** The extracted font properties.

`matplotlib.font_manager.createFontList(fontfiles, fonttext='ttf')`

A function to create a font lookup list. The default is to create a list of TrueType fonts. An AFM font list can optionally be created.

`matplotlib.font_manager.findSystemFonts(fontpaths=None, fonttext='ttf')`

Search for fonts in the specified font paths. If no paths are given, will use a standard set of system paths, as well as the list of fonts tracked by fontconfig if fontconfig is installed and available. A list of TrueType fonts are returned by default with AFM fonts as an option.

`matplotlib.font_manager.findfont(prop, **kw)`

`matplotlib.font_manager.get_font(filename, hinting_factor=None)`

`matplotlib.font_manager.get_fontconfig_fonts(fonttext='ttf')`

List the font filenames known to fc-list having the given extension.

`matplotlib.font_manager.get_fonttext_synonyms(fonttext)`

Return a list of file extensions extensions that are synonyms for the given file extension *fileext*.

`matplotlib.font_manager.is_opentype_cff_font`

Returns True if the given font is a Postscript Compact Font Format Font embedded in an OpenType wrapper. Used by the PostScript and PDF backends that can not subset these fonts.

`matplotlib.font_manager.json_dump(data, filename)`

Dumps a data structure as JSON in the named file.

Handles FontManager and its fields. File paths that are children of the Matplotlib data path (typically, fonts shipped with Matplotlib) are stored relative to that data path (to remain valid across virtualenvs).

`matplotlib.font_manager.json_load(filename)`

Loads a data structure as JSON from the named file.

Handles FontManager and its fields. Relative file paths are interpreted as being relative to the Matplotlib data path, and transformed into absolute paths.

`matplotlib.font_manager.list_fonts(directory, extensions)`

Return a list of all fonts matching any of the extensions, found recursively under the directory.

`matplotlib.font_manager.ttfFontProperty(font)`

Extract information from a TrueType font file.

### Parameters

**font** [*FT2Font*] The TrueType font file from which information will be extracted.

### Returns

**'FontEntry'** The extracted font properties.

`matplotlib.font_manager.win32FontDirectory()`

Return the user-specified font directory for Win32. This is looked up from the registry key:

```
\\HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders\Fonts
```

If the key is not found, \$WINDIR/Fonts will be returned.

`matplotlib.font_manager.win32InstalledFonts(directory=None, fonttext='ttf')`

Search for fonts in the specified font directory, or use the system directories if none given. A list of TrueType font filenames are returned by default, or AFM fonts if *fonttext* == 'afm'.

### 18.21.2 matplotlib.fontconfig\_pattern

A module for parsing and generating fontconfig patterns.

See the [fontconfig pattern specification](#) for more information.

`class matplotlib.fontconfig_pattern.FontconfigPatternParser`

Bases: `object`

A simple pyparsing-based parser for fontconfig-style patterns.

See the [fontconfig pattern specification](#) for more information.

`parse(pattern)`

Parse the given fontconfig *pattern* and return a dictionary of key/value pairs useful for initializing a `font_manager.FontProperties` object.

`matplotlib.fontconfig_pattern.family_escape($self, /, repl, string, count=0)`

Return the string obtained by replacing the leftmost non-overlapping occurrences of *pattern* in *string* by the replacement *repl*.

`matplotlib.fontconfig_pattern.family_unescape($self, /, repl, string, count=0)`

Return the string obtained by replacing the leftmost non-overlapping occurrences of *pattern* in *string* by the replacement *repl*.

`matplotlib.fontconfig_pattern.generate_fontconfig_pattern(d)`

Given a dictionary of key/value pairs, generates a fontconfig pattern string.

`matplotlib.fontconfig_pattern.parse_fontconfig_pattern`

Parse the given fontconfig *pattern* and return a dictionary of key/value pairs useful for initializing a `font_manager.FontProperties` object.

`matplotlib.fontconfig_pattern.value_escape($self, /, repl, string, count=0)`

Return the string obtained by replacing the leftmost non-overlapping occurrences of *pattern* in *string* by the replacement *repl*.

`matplotlib.fontconfig_pattern.value_unescape($self, /, repl, string, count=0)`

Return the string obtained by replacing the leftmost non-overlapping occurrences of *pattern* in *string* by the replacement *repl*.

## 18.22 gridspec

### 18.22.1 matplotlib.gridspec

*gridspec* is a module which specifies the location of the subplot in the figure.

*GridSpec* specifies the geometry of the grid that a subplot will be placed. The number of rows and number of columns of the grid need to be set. Optionally, the subplot layout parameters (e.g., left, right, etc.) can be tuned.

*SubplotSpec* specifies the location of the subplot in the given *GridSpec*.

## Classes

<i>GridSpec</i> (nrows, ncols[, figure, left, ...])	A class that specifies the geometry of the grid that a subplot will be placed.
<i>SubplotSpec</i> (gridspec, num1[, num2])	Specifies the location of the subplot in the given <i>GridSpec</i> .
<i>GridSpecBase</i> (nrows, ncols[, height_ratios, ...])	A base class of <i>GridSpec</i> that specifies the geometry of the grid that a subplot will be placed.
<i>GridSpecFromSubplotSpec</i> (nrows, ncols, ...[, ...])	<i>GridSpec</i> whose subplot layout parameters are inherited from the location specified by a given <i>SubplotSpec</i> .

## matplotlib.gridspec.GridSpec

```
class matplotlib.gridspec.GridSpec(nrows, ncols, figure=None, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None, width_ratios=None, height_ratios=None)
```

Bases: *matplotlib.gridspec.GridSpecBase*

A class that specifies the geometry of the grid that a subplot will be placed. The location of grid is determined by similar way as the *SubplotParams*.

The number of rows and number of columns of the grid need to be set. Optionally, the subplot layout parameters (e.g., left, right, etc.) can be tuned.

### Parameters

**nrows** [int] Number of rows in grid.

**ncols** [int] Number or columns in grid.

**figure** [~.figure.Figure, optional]

**left, right, top, bottom** [float] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top.

**wspace** [float] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width.

**hspace** [float] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height.

### Notes

See *SubplotParams* for descriptions of the layout parameters.

`get_subplot_params(figure=None, fig=None)`  
Return a dictionary of subplot layout parameters. The default parameters are from rcParams unless a figure attribute is set.

`locally_modified_subplot_params()`

`tight_layout(figure, renderer=None, pad=1.08, h_pad=None, w_pad=None, rect=None)`

Adjust subplot parameters to give specified padding.

### Parameters

**pad** [float] Padding between the figure edge and the edges of subplots, as a fraction of the font-size.

**h\_pad, w\_pad** [float, optional] Padding (height/width) between edges of adjacent subplots. Defaults to `pad_inches`.

**rect** [tuple of 4 floats, optional] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Default is (0, 0, 1, 1).

`update(**kwargs)`

Update the current values. If any kwarg is None, default to the current value, if set, otherwise to rc.

### Examples using `matplotlib.gridspec.GridSpec`

- [sphx\\_glr\\_gallery\\_lines\\_bars\\_and\\_markers\\_markevery\\_demo.py](#)
- [sphx\\_glr\\_gallery\\_lines\\_bars\\_and\\_markers\\_psd\\_demo.py](#)

- [Tight Layout guide](#)
- [origin and extent in imshow](#)

### `matplotlib.gridspec.SubplotSpec`

```
class matplotlib.gridspec.SubplotSpec(gridspec, num1, num2=None)
```

```
    Bases: object
```

Specifies the location of the subplot in the given *GridSpec*.

The subplot will occupy the num1-th cell of the given gridspec. If num2 is provided, the subplot will span between num1-th cell and num2-th cell.

The index starts from 0.

`get_geometry()`

Get the subplot geometry (n\_rows, n\_cols, start, stop).

start and stop are the index of the start and stop of the subplot.

`get_gridspec()`

`get_position(figure, return_all=False)`

Update the subplot position from figure.subplotpars.

`get_rows_columns()`

Get the subplot row and column numbers: (n\_rows, n\_cols, row\_start, row\_stop, col\_start, col\_stop)

`get_topmost_subplotspec()`

get the topmost SubplotSpec instance associated with the subplot

`subgridspec(nrows, ncols, **kwargs)`

Return a *GridSpecFromSubplotSpec* that has this subplotspec as a parent.

#### Parameters

**nrows** [int] Number of rows in grid.

**ncols** [int] Number or columns in grid.

#### Returns

**gridspec** [*GridSpec*]

#### Other Parameters

**\*\*kwargs** All other parameters are passed to *GridSpec*.

#### See also:

*matplotlib.pyplot.subplots*

#### Examples

Adding three subplots in the space occupied by a single subplot:

```
fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

**matplotlib.gridspec.GridSpecBase**

```
class matplotlib.gridspec.GridSpecBase(nrows, ncols, height_ratios=None,  
                                       width_ratios=None)
```

Bases: `object`

A base class of `GridSpec` that specifies the geometry of the grid that a subplot will be placed.

The number of rows and number of columns of the grid need to be set. Optionally, the ratio of heights and widths of rows and columns can be specified.

```
get_geometry()
```

get the geometry of the grid, e.g., 2,3

```
get_grid_positions(fig, raw=False)
```

return lists of bottom and top position of rows, left and right positions of columns.

If `raw=True`, then these are all in units relative to the container with no margins. (used for `constrained_layout`).

```
get_height_ratios()
```

```
get_subplot_params(figure=None, fig=None)
```

```
get_width_ratios()
```

```
new_subplotspec(loc, rowspan=1, colspan=1)
```

create and return a `SubplotSpec` instance.

```
set_height_ratios(height_ratios)
```

```
set_width_ratios(width_ratios)
```

**matplotlib.gridspec.GridSpecFromSubplotSpec**

```
class matplotlib.gridspec.GridSpecFromSubplotSpec(nrows, ncols, subplot_spec, wspace=None,  
                                                  hspace=None,  
                                                  height_ratios=None,  
                                                  width_ratios=None)
```

Bases: `matplotlib.gridspec.GridSpecBase`

`GridSpec` whose subplot layout parameters are inherited from the location specified by a given `SubplotSpec`.

The number of rows and number of columns of the grid need to be set. An instance of `SubplotSpec` is also needed to be set from which the layout parameters will be inherited. The `wspace` and `hspace` of the layout can be optionally specified or the default values (from the figure or `rcParams`) will be used.

```
get_subplot_params(figure=None, fig=None)
```

Return a dictionary of subplot layout parameters.

```
get_topmost_subplotspec()
```

Get the topmost `SubplotSpec` instance associated with the subplot.

**Examples using `matplotlib.gridspec.GridSpecFromSubplotSpec`**

- `sphx_glr_gallery_subplots_axes_and_figures_demo_constrained_layout.py`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_gridspec\_nested.py
- sphx\_glr\_gallery\_userdemo\_demo\_gridspec06.py
- *Customizing Figure Layouts Using GridSpec and Other Functions*

## 18.23 image

### 18.23.1 matplotlib.image

The image module supports basic image loading, rescaling and display operations.

```
class matplotlib.image.AxesImage(ax, cmap=None, norm=None, interpolation=None,
                                origin=None, extent=None, filternorm=1, filter-
                                rad=4.0, resample=False, **kwargs)
```

Bases: matplotlib.image.\_ImageBase

interpolation and cmap default to their rc settings

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

extent is data axes (left, right, bottom, top) for making image plots registered with data plots. Default is to label the pixel centers with the zero-based row and column indices.

Additional kwargs are matplotlib.artist properties

```
get_cursor_data(event)
```

Get the cursor data for a given event

```
get_extent()
```

Get the image extent: left, right, bottom, top

```
get_window_extent(renderer=None)
```

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

```
make_image(renderer, magnification=1.0, unsampled=False)
```

```
set_extent(extent)
```

extent is data axes (left, right, bottom, top) for making image plots

This updates ax.dataLim, and, if autoscaling, sets viewLim to tightly fit the image, regardless of dataLim. Autoscaling state is not changed, so following this with ax.autoscale\_view will redo the autoscaling in accord with dataLim.

```
class matplotlib.image.BboxImage(bbox, cmap=None, norm=None, interpolation=None,
                                origin=None, filternorm=1, filterrad=4.0, resam-
                                ple=False, interp_at_native=True, **kwargs)
```

Bases: matplotlib.image.\_ImageBase

The Image class whose size is determined by the given bbox.

`cmap` is a `colors.Colormap` instance `norm` is a `colors.Normalize` instance to map luminance to 0-1

`interp_at_native` is a flag that determines whether or not interpolation should still be applied when the image is displayed at its native resolution. A common use case for this is when displaying an image for annotational purposes; it is treated similarly to Photoshop (interpolation is only used when displaying the image at non-native resolutions).

`kwargs` are an optional list of Artist keyword args

`contains(mouseevent)`

Test whether the mouse event occurred within the image.

`get_transform()`

Return the *Transform* instance used by this artist.

`get_window_extent(renderer=None)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`make_image(renderer, magnification=1.0, unsampled=False)`

```
class matplotlib.image.FigureImage(fig, cmap=None, norm=None, offsetx=0, offsety=0,
                                   origin=None, **kwargs)
```

Bases: `matplotlib.image._ImageBase`

`cmap` is a `colors.Colormap` instance `norm` is a `colors.Normalize` instance to map luminance to 0-1

`kwargs` are an optional list of Artist keyword args

`get_extent()`

Get the image extent: left, right, bottom, top

`make_image(renderer, magnification=1.0, unsampled=False)`

`set_data(A)`

Set the image array.

`zorder = 0`

```
class matplotlib.image.NonUniformImage(ax, *, interpolation='nearest', **kwargs)
```

Bases: `matplotlib.image.AxesImage`

`kwargs` are identical to those for `AxesImage`, except that 'nearest' and 'bilinear' are the only supported 'interpolation' options.

`get_extent()`

Get the image extent: left, right, bottom, top

`make_image(renderer, magnification=1.0, unsampled=False)`

`set_array(*args)`

Retained for backwards compatibility - use `set_data` instead.

### Parameters

**A** [array-like]

`set_cmap(cmap)`  
set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

`set_data(x, y, A)`  
Set the grid for the pixel centers, and the pixel values.

**x and y are monotonic 1-D ndarrays of lengths N and M,**  
respectively, specifying pixel centers

**A is an (M,N) ndarray or masked array of values to be** colormapped,  
or a (M,N,3) RGB array, or a (M,N,4) RGBA array.

`set_filternorm(s)`  
Set whether the resize filter normalizes the weights.

See help for *imshow*.

**Parameters**

**filternorm** [bool]

`set_filterrad(s)`  
Set the resize filter radius only applicable to some interpolation schemes – see help for *imshow*

**Parameters**

**filterrad** [positive float]

`set_interpolation(s)`

**Parameters**

**s** [str, None] Either 'nearest', 'bilinear', or None.

`set_norm(norm)`  
Set the normalization instance.

**Parameters**

**norm** [*Normalize*]

`class matplotlib.image.PcolorImage(ax, x=None, y=None, A=None, cmap=None,  
norm=None, **kwargs)`

Bases: *matplotlib.image.AxesImage*

Make a pcolor-style plot with an irregular rectangular grid.

This uses a variation of the original irregular image code, and it is used by *pcolorfast* for the corresponding grid type.

*cmap* defaults to its rc setting

*cmap* is a *colors.Colormap* instance *norm* is a *colors.Normalize* instance to map luminance to 0-1

Additional kwargs are *matplotlib.artist* properties

`get_cursor_data(event)`  
Get the cursor data for a given event

`make_image(renderer, magnification=1.0, unsampled=False)`

`set_array(*args)`

Retained for backwards compatibility - use `set_data` instead.

#### Parameters

**A** [array-like]

`set_data(x, y, A)`

Set the grid for the rectangle boundaries, and the data values.

**x and y are monotonic 1-D ndarrays of lengths N+1 and M+1**, respectively, specifying rectangle boundaries. If `None`, they will be created as uniform arrays from 0 through N and 0 through M, respectively.

**A is an (M,N) ndarray or masked array of values to be** colormapped, or a (M,N,3) RGB array, or a (M,N,4) RGBA array.

`matplotlib.image.composite_images(images, renderer, magnification=1.0)`

Composite a number of RGBA images into one. The images are composited in the order in which they appear in the `images` list.

#### Parameters

**images** [list of Images] Each must have a `make_image` method. For each image, `can_composite` should return `True`, though this is not enforced by this function. Each image must have a purely affine transformation with no shear.

**renderer** [RendererBase instance]

**magnification** [float] The additional magnification to apply for the renderer in use.

#### Returns

**tuple** [image, offset\_x, offset\_y] Returns the tuple:

- **image**: A numpy array of the same type as the input images.
- **offset\_x, offset\_y**: The offset of the image (left, bottom) in the output figure.

`matplotlib.image.imread(fname, format=None)`

Read an image from a file into an array.

#### Parameters

**fname** [str or file-like] The image file to read. This can be a filename, a URL or a Python file-like object opened in read-binary mode.

**format** [str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

#### Returns

**imagedata** [numpy.array] The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

## Notes

Matplotlib can only read PNGs natively. Further image formats are supported via the optional dependency on Pillow. Note, URL strings are not compatible with Pillow. Check the [Pillow documentation](#) for more information.

```
matplotlib.image.imsave(fname, arr, vmin=None, vmax=None, cmap=None, format=None, origin=None, dpi=100)
```

Save an array as in image file.

The output formats available depend on the backend being used.

### Parameters

**fname** [str or file-like] The filename or a Python file-like object to store the image in. The necessary output format is inferred from the filename extension but may be explicitly overwritten using *format*.

**arr** [array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

**vmin, vmax** [scalar, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

**cmap** [str or *Colormap*, optional] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data. Defaults to `rcParams["image.cmap"]` ('viridis').

**format** [str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... . If not given, the format is deduced from the filename extension in *fname*. See *Figure.savefig* for details.

**origin** [{'upper', 'lower'}, optional] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes. Defaults to `rcParams["image.origin"]` ('upper').

**dpi** [int] The DPI to store in the metadata of the file. This does not affect the resolution of the output image.

```
matplotlib.image.pil_to_array(pillImage)
```

Load a [PIL image](#) and return it as a numpy array.

### Returns

**numpy.array** The array shape depends on the image type:

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

```
matplotlib.image.thumbnail(infile, thumbfile, scale=0.1, interpolation='bilinear', preview=False)
```

Make a thumbnail of image in *infile* with output filename *thumbfile*.

See [/gallery/misc/image\\_thumbnail\\_sgskip](#).

### Parameters

**infile** [str or file-like] The image file - must be PNG, Pillow-readable if you have [Pillow](#) installed.

**thumbfile** [str or file-like] The thumbnail filename.

**scale** [float, optional] The scale factor for the thumbnail.

**interpolation** [str, optional] The interpolation scheme used in the resampling. See the *interpolation* parameter of *imshow* for possible values.

**preview** [bool, optional] If True, the default backend (presumably a user interface backend) will be used which will cause a figure to be raised if *show* is called. If it is False, the figure is created using `FigureCanvasBase` and the drawing backend is selected as `savefig` would normally do.

### Returns

**figure** [*Figure*] The figure instance containing the thumbnail.

## 18.24 legend and legend\_handler

### 18.24.1 matplotlib.legend

The legend module defines the `Legend` class, which is responsible for drawing legends associated with axes and/or figures.

---

**Important:** It is unlikely that you would ever create a `Legend` instance manually. Most users would normally create a legend via the `legend()` function. For more details on legends there is also a *legend guide*.

---

The `Legend` class can be considered as a container of legend handles and legend texts. Creation of corresponding legend handles from the plot elements in the axes or figures (e.g., lines, patches, etc.) are specified by the handler map, which defines the mapping between the plot elements and the legend handlers to be used (the default legend handlers are defined in the *legend\_handler* module). Note that not all kinds of artist are supported by the legend yet by default but it is possible to extend the legend handler's capabilities to support arbitrary objects. See the *legend guide* for more information.

```
class matplotlib.legend.DraggableLegend(legend, use_blit=False, update='loc')
    Bases: matplotlib.offsetbox.DraggableOffsetBox
```

Wrapper around a *Legend* to support mouse dragging.

### Parameters

**legend** [*Legend*] The *Legend* instance to wrap.

**use\_blit** [bool, optional] Use blitting for faster image composition. For details see *FuncAnimation*.

**update** [{`'loc'`, `'bbox'`}, optional] If `"loc"`, update the `loc` parameter of the legend upon finalizing. If `"bbox"`, update the `bbox_to_anchor` parameter.

```
artist_picker(legend, evt)
```

```
finalize_offset()
```

```
class matplotlib.legend.Legend(parent, handles, labels, loc=None, numpoints=None,
                               markerscale=None, markerfirst=True, scatter-
                               points=None, scatteryoffsets=None, prop=None,
                               fontsize=None, borderpad=None, labelspacing=None,
                               handlelength=None, handleheight=None, handle-
                               textpad=None, borderaxespadd=None, columnspac-
                               ing=None, ncol=1, mode=None, fancybox=None,
                               shadow=None, title=None, title_fontsize=None,
                               framealpha=None, edgecolor=None, facecolor=None,
                               bbox_to_anchor=None,          bbox_transform=None,
                               frameon=None, handler_map=None)
```

Bases: `matplotlib.artist.Artist`

Place a legend on the axes at location `loc`.

### Parameters

**parent** [`Axes` or `Figure`] The artist that contains the legend.

**handles** [sequence of `Artist`] A list of Artists (lines, patches) to be added to the legend.

**labels** [sequence of strings] A list of labels to show next to the artists. The length of handles and labels should be the same. If they are not, they are truncated to the smaller of both lengths.

### Other Parameters

**loc** [int or string or pair of floats, default: `rcParams["legend.loc"]`] ('best' for axes, 'upper right' for figures) The location of the legend. Possible codes are:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

Alternatively can be a 2-tuple giving `x`, `y` of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

**bbox\_to\_anchor** [`BboxBase`, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

`Bbox` coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform `Axes` or `Figure` coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

- ncol** [integer] The number of columns that the legend has. Default is 1.
- prop** [None or *matplotlib.font\_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.
- fontsize** [int or float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] Controls the font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.
- numpoints** [None or int] The number of marker points in the legend when creating a legend entry for a *Line2D* (line). Default is None, which will take the value from *rcParams["legend.numpoints"]*.
- scatterpoints** [None or int] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot). Default is None, which will take the value from *rcParams["legend.scatterpoints"]*.
- scatteryoffsets** [iterable of floats] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5]. Default is [0.375, 0.5, 0.3125].
- markerscale** [None or int or float] The relative size of legend markers compared with the originally drawn ones. Default is None, which will take the value from *rcParams["legend.markerscale"]*.
- markerfirst** [bool] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label. Default is *True*.
- frameon** [None or bool] Control whether the legend should be drawn on a patch (frame). Default is None, which will take the value from *rcParams["legend.frameon"]*.
- fancybox** [None or bool] Control whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background. Default is None, which will take the value from *rcParams["legend.fancybox"]*.
- shadow** [None or bool] Control whether to draw a shadow behind the legend. Default is None, which will take the value from *rcParams["legend.shadow"]*.

- framealpha** [None or float] Control the alpha transparency of the legend's background. Default is `None`, which will take the value from `rcParams["legend.framealpha"]`. If shadow is activated and *framealpha* is `None`, the default value is ignored.
- facecolor** [None or "inherit" or a color spec] Control the legend's background color. Default is `None`, which will take the value from `rcParams["legend.facecolor"]`. If "inherit", it will take `rcParams["axes.facecolor"]`.
- edgecolor** [None or "inherit" or a color spec] Control the legend's background patch edge color. Default is `None`, which will take the value from `rcParams["legend.edgecolor"]`. If "inherit", it will take `rcParams["axes.edgecolor"]`.
- mode** [{"expand", None}] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the legend's size).
- bbox\_transform** [None or `matplotlib.transforms.Transform`] The transform for the bounding box (`bbox_to_anchor`). For a value of `None` (default) the Axes' `transAxes` transform will be used.
- title** [str or None] The legend's title. Default is no title (`None`).
- title\_fontsize: str or None** The fontsize of the legend's title. Default is the default fontsize.
- borderpad** [float or None] The fractional whitespace inside the legend border. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.borderpad"]`.
- labelspacing** [float or None] The vertical space between the legend entries. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.labelspacing"]`.
- handlelength** [float or None] The length of the legend handles. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.handlelength"]`.
- handletextpad** [float or None] The pad between the legend handle and text. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.handletextpad"]`.
- borderaxespad** [float or None] The pad between the axes and legend border. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.borderaxespad"]`.
- columnspacing** [float or None] The spacing between columns. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.columnspacing"]`.
- handler\_map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map()`.

## Notes

Users can specify any arbitrary location for the legend using the *bbox\_to\_anchor* keyword argument. *bbox\_to\_anchor* can be an instance of *BboxBase* (or its derivatives) or a tuple of 2 or 4 floats. See *set\_bbox\_to\_anchor()* for more detail.

The legend location can be specified by setting *loc* with a tuple of 2 floats, which is interpreted as the lower-left corner of the legend in the normalized axes coordinate.

```
codes = {'best': 0, 'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower
```

```
contains(event)
```

Test whether the artist contains the mouse event.

Returns the truth value and a dictionary of artist specific details of selection, such as which points are contained in the pick radius. See individual artists for details.

```
draggable(state=None, use_blit=False, update='loc')
```

Set the draggable state - if state is

- None : toggle the current state
- True : turn draggable on
- False : turn draggable off

If draggable is on, you can drag the legend on the canvas with the mouse. The *DraggableLegend* helper instance is returned if draggable is on.

The update parameter control which parameter of the legend changes when dragged. If update is "loc", the *loc* parameter of the legend is changed. If "bbox", the *bbox\_to\_anchor* parameter is changed.

```
draw(renderer)
```

Draw everything that belongs to the legend.

```
draw_frame(b)
```

Set draw frame to b.

### Parameters

**b** [bool]

```
get_bbox_to_anchor()
```

Return the bbox that the legend will be anchored to.

```
get_children()
```

Return a list of child artists.

```
classmethod get_default_handler_map()
```

A class method that returns the default handler map.

```
get_draggable()
```

Return True if the legend is draggable, False otherwise.

```
get_frame()
```

Return the *Rectangle* instances used to frame the legend.

```
get_frame_on()
```

Get whether the legend box patch is drawn.

```
static get_legend_handler(legend_handler_map, orig_handler)
```

Return a legend handler from *legend\_handler\_map* that corresponds to *orig\_handler*.

*legend\_handler\_map* should be a dictionary object (that is returned by the `get_legend_handler_map` method).

It first checks if the *orig\_handle* itself is a key in the *legend\_handler\_map* and return the associated value. Otherwise, it checks for each of the classes in its method-resolution-order. If no matching key is found, it returns `None`.

`get_legend_handler_map()`

Return the handler map.

`get_lines()`

Return a list of *Line2D* instances in the legend.

`get_patches()`

Return a list of *Patch* instances in the legend.

`get_texts()`

Return a list of *Text* instances in the legend.

`get_tightbbox(renderer)`

Like *Legend.get\_window\_extent*, but uses the box for the legend.

### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

**‘.BboxBase’** [containing the bounding box in figure pixel coordinates.]

`get_title()`

Return the *Text* instance for the legend title.

`get_window_extent(renderer=None)`

Return extent of the legend.

`set_bbox_to_anchor(bbox, transform=None)`

Set the bbox that the legend will be anchored to.

*bbox* can be

- A *BboxBase* instance
- A tuple of (left, bottom, width, height) in the given transform (normalized axes coordinate if None)
- A tuple of (left, bottom) where the width and height will be assumed to be zero.

classmethod `set_default_handler_map(handler_map)`

A class method to set the default handler map.

`set_draggable(state, use_blit=False, update='loc')`

Enable or disable mouse dragging support of the legend.

### Parameters

**state** [bool] Whether mouse dragging is enabled.

**use\_blit** [bool, optional] Use blitting for faster image composition. For details see *FuncAnimation*.

**update** [{'loc', 'bbox'}, optional] The legend parameter to be changed when dragged:

- 'loc': update the *loc* parameter of the legend
- 'bbox': update the *bbox\_to\_anchor* parameter of the legend

### Returns

If *\*state\** is "True" this returns the '~.DraggableLegend' helper

instance. Otherwise this returns "None".

`set_frame_on(b)`

Set whether the legend box patch is drawn.

### Parameters

**b** [bool]

`set_title(title, prop=None)`

Set the legend title. Fontproperties can be optionally set with *prop* parameter.

`classmethod update_default_handler_map(handler_map)`

A class method to update the default handler map.

`zorder = 5`

## 18.24.2 matplotlib.legend\_handler

This module defines default legend handlers.

It is strongly encouraged to have read the *legend guide* before this documentation.

Legend handlers are expected to be a callable object with a following signature.

```
legend_handler(legend, orig_handle, fontsize, handlebox)
```

Where *legend* is the legend itself, *orig\_handle* is the original plot, *fontsize* is the fontsize in pixels, and *handlebox* is a `OffsetBox` instance. Within the call, you should create relevant artists (using relevant properties from the *legend* and/or *orig\_handle*) and add them into the *handlebox*. The artists needs to be scaled according to the *fontsize* (note that the size is in pixel, i.e., this is dpi-scaled value).

This module includes definition of several legend handler classes derived from the base class (`HandlerBase`) with the following method:

```
def legend_artist(self, legend, orig_handle, fontsize, handlebox):
```

```
class matplotlib.legend_handler.HandlerBase(xpad=0.0, ypad=0.0, update_func=None)
```

A Base class for default legend handlers.

The derived classes are meant to override *create\_artists* method, which has a following signature.:

```
def create_artists(self, legend, orig_handle,
                  xdescent, ydescent, width, height, fontsize,
                  trans):
```

The overridden method needs to create artists of the given transform that fits in the given dimension (xdescent, ydescent, width, height) that are scaled by fontsize if necessary.

```
adjust_drawing_area(legend, orig_handle, xdescent, ydescent, width, height, font-size)
```

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)
```

```
legend_artist(legend, orig_handle, fontsize, handlebox)
```

Return the artist that this HandlerBase generates for the given original artist/handle.

### Parameters

**legend** [*matplotlib.legend.Legend* instance] The legend for which these legend artists are being created.

**orig\_handle** [*matplotlib.artist.Artist* or similar] The object for which these legend artists are being created.

**fontsize** [float or int] The fontsize in pixels. The artists being created should be scaled according to the given fontsize.

**handlebox** [*matplotlib.offsetbox.OffsetBox* instance] The box which has been created to hold this legend entry's artists. Artists created in the *legend\_artist* method must be added to this handlebox inside this method.

```
update_prop(legend_handle, orig_handle, legend)
```

```
class matplotlib.legend_handler.HandlerCircleCollection(yoffsets=None, sizes=None, **kw)
```

Handler for CircleCollections.

```
create_collection(orig_handle, sizes, offsets, transOffset)
```

```
class matplotlib.legend_handler.HandlerErrorbar(xerr_size=0.5, yerr_size=None, marker_pad=0.3, numpoints=None, **kw)
```

Handler for Errorbars.

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)
```

```
get_err_size(legend, xdescent, ydescent, width, height, fontsize)
```

```
class matplotlib.legend_handler.HandlerLine2D(marker_pad=0.3, numpoints=None, **kw)
```

Handler for *Line2D* instances.

### Parameters

**marker\_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.

### Notes

Any other keyword arguments are given to *HandlerNpoints*.

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)
```

```
class matplotlib.legend_handler.HandlerLineCollection(marker_pad=0.3, num-  
                                                    points=None, **kw)
```

Handler for *LineCollection* instances.

#### Parameters

**marker\_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.

#### Notes

Any other keyword arguments are given to *HandlerNpoints*.

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize,  
              trans)
```

```
get_numpoints(legend)
```

```
class matplotlib.legend_handler.HandlerNpoints(marker_pad=0.3, numpoints=None,  
                                              **kw)
```

A legend handler that shows *numpoints* points in the legend entry.

#### Parameters

**marker\_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.

#### Notes

Any other keyword arguments are given to *HandlerBase*.

```
get_numpoints(legend)
```

```
get_xdata(legend, xdescent, ydescent, width, height, fontsize)
```

```
class matplotlib.legend_handler.HandlerNpointsYoffsets(numpoints=None, yoff-  
                                                       sets=None, **kw)
```

A legend handler that shows *numpoints* in the legend, and allows them to be individually offset in the y-direction.

#### Parameters

**numpoints** [int] Number of points to show in legend entry.

**yoffsets** [array of floats] Length *numpoints* list of y offsets for each point in legend entry.

#### Notes

Any other keyword arguments are given to *HandlerNpoints*.

```
get_ydata(legend, xdescent, ydescent, width, height, fontsize)
```

```
class matplotlib.legend_handler.HandlerPatch(patch_func=None, **kw)  
Handler for Patch instances.
```

#### Parameters

**patch\_func** [callable, optional] The function that creates the legend key artist. *patch\_func* should have the signature:

```
def patch_func(legend=legend, orig_handle=orig_handle,
               xdescent=xdescent, ydescent=ydescent,
               width=width, height=height, fontsize=fontsize)
```

Subsequently the created artist will have its `update_prop` method called and the appropriate transform will be applied.

## Notes

Any other keyword arguments are given to *HandlerBase*.

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize,
               trans)
```

```
class matplotlib.legend_handler.HandlerPathCollection(yoffsets=None, sizes=None,
                                                       **kw)
```

Handler for PathCollections, which are used by *scatter*.

```
create_collection(orig_handle, sizes, offsets, transOffset)
```

```
class matplotlib.legend_handler.HandlerPolyCollection(xpad=0.0, ypad=0.0, update_func=None)
```

Handler for *PolyCollection* used in *fill\_between* and *stackplot*.

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize,
               trans)
```

```
class matplotlib.legend_handler.HandlerRegularPolyCollection(yoffsets=None,
                                                             sizes=None, **kw)
```

Handler for RegularPolyCollections.

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize,
               trans)
```

```
create_collection(orig_handle, sizes, offsets, transOffset)
```

```
get_numpoints(legend)
```

```
get_sizes(legend, orig_handle, xdescent, ydescent, width, height, fontsize)
```

```
update_prop(legend_handle, orig_handle, legend)
```

```
class matplotlib.legend_handler.HandlerStem(marker_pad=0.3, numpoints=None, bottom=None,
                                             yoffsets=None, **kw)
```

Handler for plots produced by *stem*.

## Parameters

**marker\_pad** [float] Padding between points in legend entry. Default is 0.3.

**numpoints** [int, optional] Number of points to show in legend entry.

**bottom** [float, optional]

**yoffsets** [array of floats, optional] Length *numpoints* list of y offsets for each point in legend entry.

## Notes

Any other keyword arguments are given to *HandlerNpointsYoffsets*.

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize,
               trans)
```

```
get_ydata(legend, xdescent, ydescent, width, height, fontsize)
```

```
class matplotlib.legend_handler.HandlerTuple(ndivide=1, pad=None, **kwargs)
    Handler for Tuple.
```

Additional kwargs are passed through to *HandlerBase*.

## Parameters

**ndivide** [int, optional] The number of sections to divide the legend area into. If None, use the length of the input tuple. Default is 1.

**pad** [float, optional] If None, fall back to `legend.borderpad` as the default. In units of fraction of font size. Default is None.

```
create_artists(legend, orig_handle, xdescent, ydescent, width, height, fontsize,
               trans)
```

```
matplotlib.legend_handler.update_from_first_child(tgt, src)
```

## 18.25 lines

### 18.25.1 matplotlib.lines

This module contains all the 2D line class which can draw with a variety of line styles, markers and colors.

#### Classes

<i>Line2D</i> (xdata, ydata[, linewidth, linestyle, ...])	A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex.
<i>VertexSelector</i> (line)	Manage the callbacks to maintain a list of selected vertices for <i>matplotlib.lines.Line2D</i> .

#### matplotlib.lines.Line2D

```
class matplotlib.lines.Line2D(xdata, ydata, linewidth=None, linestyle=None,
                              color=None, marker=None, markersize=None,
                              markeredgewidth=None, markeredgewidth=None,
                              markerfacecolor=None, markerfacecoloralt='none',
                              fillstyle=None, antialiased=None, dash_capstyle=None,
                              solid_capstyle=None, dash_joinstyle=None,
                              solid_joinstyle=None, pickradius=5, drawstyle=None,
                              markevery=None, **kwargs)
```

Bases: *matplotlib.artist.Artist*

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex. Additionally, the drawing of the solid line is influenced by the drawstyle, e.g., one can create "stepped" lines in various styles.

Create a *Line2D* instance with x and y data in sequences *xdata*, *ydata*.

The kwargs are *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float
<i>animated</i>	bool
<i>antialiased</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>drawstyle</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i>	{'-', '-', '-.', ':', "", (offset, on-off-seq), ...}
<i>linewidth</i>	float
<i>marker</i>	unknown
<i>markeredgecolor</i>	color
<i>markeredgewidth</i>	float
<i>markerfacecolor</i>	color
<i>markerfacecoloralt</i>	color
<i>markersize</i>	float
<i>markevery</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	float or callable[[ <i>Artist</i> , <i>Event</i> ], Tuple[bool, dict]]
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	matplotlib.transforms.Transform
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

See `set_linestyle()` for a description of the line styles, `set_marker()` for a description of the markers, and `set_drawstyle()` for a description of the draw styles.

`axes`

The *Axes* instance the artist resides in, or *None*.

`contains(mouseevent)`

Test whether the mouse event occurred on the line. The pick radius determines the precision of the location test (usually within five points of the value). Use `get_pickradius()` or `set_pickradius()` to view or modify it.

Returns *True* if any values are within the radius along with `{'ind': pointlist}`, where *pointlist* is the set of points within the radius.

TODO: sort returned indices by distance

`draw(renderer)`

draw the Line with *renderer* unless *visibility* is *False*

`drawStyleKeys = ['default', 'steps-mid', 'steps-pre', 'steps-post', 'steps']`

`drawStyles = {'default': '_draw_lines', 'steps': '_draw_steps_pre', 'steps-mid': '_draw_steps_mid`

`fillStyles = ('full', 'left', 'right', 'bottom', 'top', 'none')`

`filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')`

`get_aa(*args, **kwargs)`

alias for `get_antialiased`

`get_antialiased()`

`get_c(*args, **kwargs)`

alias for `get_color`

`get_color()`

`get_dash_capstyle()`

Get the cap style for dashed linestyles

`get_dash_joinstyle()`

Get the join style for dashed linestyles

`get_data(orig=True)`

Return the xdata, ydata.

If *orig* is *True*, return the original data.

`get_drawstyle()`

`get_fillstyle()`

return the marker fillstyle

`get_linestyle()`

`get_linewidth()`

`get_ls(*args, **kwargs)`

alias for `get_linestyle`

`get_lw(*args, **kwargs)`

alias for `get_linewidth`

`get_marker()`

`get_markeredgecolor()`

```

get_markerewidth()
get_markerfacecolor()
get_markerfacecoloralt()
get_markersize()
get_markevery()
    return the markevery setting
get_mec(*args, **kwargs)
    alias for get_markeredgecolor
get_mew(*args, **kwargs)
    alias for get_markerewidth
get_mfc(*args, **kwargs)
    alias for get_markerfacecolor
get_mfcalt(*args, **kwargs)
    alias for get_markerfacecoloralt
get_ms(*args, **kwargs)
    alias for get_markersize
get_path()
    Return the Path object associated with this line.
get_pickradius()
    return the pick radius used for containment tests
get_solid_capstyle()
    Get the cap style for solid linestyles
get_solid_joinstyle()
    Get the join style for solid linestyles
get_window_extent(renderer)
    Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_xdata(orig=True)
    Return the xdata.

    If orig is True, return the original data, else the processed data.

get_xydata()
    Return the xy data as a Nx2 numpy array.

get_ydata(orig=True)
    Return the ydata.

    If orig is True, return the original data, else the processed data.

is_dashed()
    return True if line is dashstyle

```

```

lineStyles = {'': '_draw_nothing', ' ': '_draw_nothing', '-': '_draw_solid', '--': '_draw_dashed'
markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triangle_up', '
recache(always=False)
recache_always()
set_aa(*args, **kwargs)
    alias for set_antialiased
set_antialiased(b)
    Set whether to use antialiased rendering.

```

**Parameters****b** [bool]

```

set_c(*args, **kwargs)
    alias for set_color

```

```

set_color(color)
    Set the color of the line

```

**Parameters****color** [color]

```

set_dash_capstyle(s)
    Set the cap style for dashed linestyles.

```

**Parameters****s** [{'butt', 'round', 'projecting'}]

```

set_dash_joinstyle(s)
    Set the join style for dashed linestyles.

```

**Parameters****s** [{'miter', 'round', 'bevel'}]

```

set_dashes(seq)
    Set the dash sequence, sequence of dashes with on off ink in points. If seq is empty
    or if seq = (None, None), the linestyle will be set to solid.

```

**Parameters****seq** [sequence of floats (on/off ink in points) or (None, None)]

```

set_data(*args)
    Set the x and y data
    ACCEPTS: 2D array (rows are x, y) or two 1D arrays

```

```

set_drawstyle(drawstyle)
    Set the drawstyle of the plot
    'default' connects the points with lines. The steps variants produce step-plots.
    'steps' is equivalent to 'steps-pre' and is maintained for backward-compatibility.

```

**Parameters****drawstyle** [{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}]

`set_fillstyle(fs)`

Set the marker fill style; 'full' means fill the whole marker. 'none' means no filling; other options are for half-filled markers.

#### Parameters

**fs** [{'full', 'left', 'right', 'bottom', 'top', 'none'}]

`set_linestyle(ls)`

Set the linestyle of the line (also accepts drawstyles, e.g., 'steps--')

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line
'None'	draw nothing
' '	draw nothing
''	draw nothing

'steps' is equivalent to 'steps-pre' and is maintained for backward-compatibility.

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

#### See also:

`set_drawstyle()` To set the drawing style (stepping) of the plot.

#### Parameters

**ls** [{'-', '-', '-.', ':', "", (offset, on-off-seq), ...}] The line style.

`set_linewidth(w)`

Set the line width in points

#### Parameters

**w** [float]

`set_ls(*args, **kwargs)`

alias for `set_linestyle`

`set_lw(*args, **kwargs)`

alias for `set_linewidth`

`set_marker(marker)`

Set the line marker.

#### Parameters

**marker: marker style** See [markers](#) for full description of possible arguments.

`set_markeredgecolor(ec)`

Set the marker edge color.

#### Parameters

**ec** [color]

`set_markerewidth(ew)`

Set the marker edge width in points.

**Parameters**

**ew** [float]

`set_markerfacecolor(fc)`

Set the marker face color.

**Parameters**

**fc** [color]

`set_markerfacecoloralt(fc)`

Set the alternate marker face color.

**Parameters**

**fc** [color]

`set_markersize(sz)`

Set the marker size in points.

**Parameters**

**sz** [float]

`set_markevery(every)`

Set the markevery property to subsample the plot when using markers.

e.g., if `every=5`, every 5-th marker will be plotted.

**Parameters**

**every: None or int or (int, int) or slice or List[int] or float or (float, float)**

Which markers to plot.

- `every=None`, every point will be plotted.
- `every=N`, every N-th marker will be plotted starting with marker 0.
- `every=(start, N)`, every N-th marker, starting at point `start`, will be plotted.
- `every=slice(start, end, N)`, every N-th marker, starting at point `start`, up to but not including point `end`, will be plotted.
- `every=[i, j, m, n]`, only markers at points `i`, `j`, `m`, and `n` will be plotted.
- `every=0.1`, (i.e. a float) then markers will be spaced at approximately equal distances along the line; the distance along the line between markers is determined by multiplying the display-coordinate distance of the axes bounding-box diagonal by the value of `every`.
- `every=(0.5, 0.1)` (i.e. a length-2 tuple of float), the same functionality as `every=0.1` is exhibited but the first marker will be 0.5 multiplied by the display-coordinate-diagonal-distance along the line.

## Notes

Setting the `markevery` property will only show markers at actual data points. When using float arguments to set the `markevery` property on irregularly spaced data, the markers will likely not appear evenly spaced because the actual data points do not coincide with the theoretical spacing between markers.

When using a start offset to specify the first marker, the offset will be from the first data point which may be different from the first the visible data point if the plot is zoomed in.

If zooming in on a plot when using float arguments then the actual data points that have markers will change because the distance between markers is always determined from the display-coordinates axes-bounding-box-diagonal regardless of the actual axes data limits.

`set_mec(*args, **kwargs)`  
alias for `set_markeredgecolor`

`set_mew(*args, **kwargs)`  
alias for `set_markeredgewidth`

`set_mfc(*args, **kwargs)`  
alias for `set_markerfacecolor`

`set_mfcalt(*args, **kwargs)`  
alias for `set_markerfacecoloralt`

`set_ms(*args, **kwargs)`  
alias for `set_markersize`

`set_picker(p)`  
Sets the event picker details for the line.

### Parameters

**p** [float or callable[[Artist, Event], Tuple[bool, dict]]] If a float, it is used as the pick radius in points.

`set_pickradius(d)`  
Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_solid_capstyle(s)`  
Set the cap style for solid linestyles.

### Parameters

**s** [{'butt', 'round', 'projecting'}]

`set_solid_joinstyle(s)`  
Set the join style for solid linestyles.

### Parameters

**s** [{'miter', 'round', 'bevel'}]

`set_transform(t)`  
set the Transformation instance used by this artist

### Parameters

**t** [matplotlib.transforms.Transform]

`set_xdata(x)`

Set the data array for x.

**Parameters**

**x** [1D array]

`set_ydata(y)`

Set the data array for y.

**Parameters**

**y** [1D array]

`update_from(other)`

copy properties from other to self

`validCap = ('butt', 'round', 'projecting')`

`validJoin = ('miter', 'round', 'bevel')`

`zorder = 2`

**matplotlib.lines.VertexSelector**

`class matplotlib.lines.VertexSelector(line)`

Bases: `object`

Manage the callbacks to maintain a list of selected vertices for `matplotlib.lines.Line2D`.  
Derived classes should override `process_selected()` to do something with the picks.

Here is an example which highlights the selected verts with red circles:

```

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.lines as lines

class HighlightSelected(lines.VertexSelector):
    def __init__(self, line, fmt='ro', **kwargs):
        lines.VertexSelector.__init__(self, line)
        self.markers, = self.axes.plot([], [], fmt, **kwargs)

    def process_selected(self, ind, xs, ys):
        self.markers.set_data(xs, ys)
        self.canvas.draw()

fig, ax = plt.subplots()
x, y = np.random.rand(2, 30)
line, = ax.plot(x, y, 'bs-', picker=5)

selector = HighlightSelected(line)
plt.show()

```

Initialize the class with a `matplotlib.lines.Line2D` instance. The line should already be added to some `matplotlib.axes.Axes` instance and should have the `picker` property set.

`onpick(event)`

When the line is picked, update the set of selected indices.

`process_selected(ind, xs, ys)`

Default "do nothing" implementation of the `process_selected()` method.

`ind` are the indices of the selected vertices. `xs` and `ys` are the coordinates of the selected vertices.

## Functions

---

`segment_hits(cx, cy, x, y, radius)`

Determine if any line segments are within radius of a point.

---

### `matplotlib.lines.segment_hits`

`matplotlib.lines.segment_hits(cx, cy, x, y, radius)`

Determine if any line segments are within radius of a point. Returns the list of line segments that are within that radius.

## 18.26 markers

### 18.26.1 `matplotlib.markers`

This module contains functions to handle markers. Used by both the marker functionality of `plot` and `scatter`.

All possible markers are defined here:

marker	symbol	description
"."		point
","		pixel
"o"		circle
"v"		triangle_down
"^"		triangle_up
"<"		triangle_left
">"		triangle_right
"1"		tri_down
"2"		tri_up
"3"		tri_left
"4"		tri_right
"8"		octagon
"s"		square
"p"		pentagon
"P"		plus (filled)
"*"		star
"h"		hexagon1
"H"		hexagon2
"+"		plus
"x"		x
"X"		x (filled)
"D"		diamond
"d"		thin_diamond
" "		vline
"_"		hline
0 (TICKLEFT)		tickleft
1 (TICKRIGHT)		tickright
2 (TICKUP)		tickup
3 (TICKDOWN)		tickdown
4 (CARETLEFT)		caretleft
5 (CARETRIGHT)		caretright
6 (CARETUP)		caretup
7 (CARETDOWN)		caretdown
8 (CARETLEFTBASE)		caretleft (centered at base)
9 (CARETRIGHTBASE)		caretright (centered at base)

Continued on next page

Table 147 – continued from previous page

marker	symbol	description
10 (CARETUPBASE)		caretup (centered at base)
11 (CARETDOWNBASE)		caretdown (centered at base)
"None", " " or ""		nothing
'\$...\$'		Render the string using <code>mathtext</code> . E.g. "\$f\$" for marker showing the letter <i>f</i> .
verts		A list of (x, y) pairs used for Path vertices. The center of the marker is located at (0,0) and the size is normalized, such that the created path is encapsulated inside the unit cell.
path		A <i>Path</i> instance.
(numsides, style, angle)		<p>The marker can also be a tuple (numsides, style, angle), which will create a custom, regular symbol.</p> <p><b>numsides:</b> the number of sides</p> <p><b>style:</b> the style of the regular symbol:</p> <ul style="list-style-type: none"> <li>• 0: a regular polygon</li> <li>• 1: a star-like symbol</li> <li>• 2: an asterisk</li> <li>• 3: a circle (numsides and angle is ignored); deprecated.</li> </ul> <p><b>angle:</b> the angle of rotation of the symbol</p>

For backward compatibility, the form (verts, 0) is also accepted, but it is deprecated and equivalent to just verts for giving a raw set of vertices that define the shape.

None is the default which means 'nothing', however this table is referred to from other docs for the valid inputs from marker inputs and in those cases None still means 'default'.

Note that special symbols can be defined via the *STIX math font*, e.g. "\$f\$". For an overview over the STIX font symbols refer to the *STIX font table*. Also see the */gallery/text\_labels\_and\_annotations/stix\_fonts\_demo*.

Integer numbers from 0 to 11 create lines and triangles. Those are equally accessible via capitalized variables, like CARETDOWNBASE. Hence the following are equivalent:

```
plt.plot([1,2,3], marker=11)
plt.plot([1,2,3], marker=matplotlib.markers.CARETDOWNBASE)
```

Examples showing the use of markers:

- [/gallery/lines\\_bars\\_and\\_markers/marker\\_reference](#)
- [/gallery/lines\\_bars\\_and\\_markers/marker\\_fillstyle\\_reference](#)
- [/gallery/shapes\\_and\\_collections/marker\\_path](#)

## Classes

---

*MarkerStyle*([marker, fillstyle])

### Parameters

---

#### matplotlib.markers.MarkerStyle

class matplotlib.markers.MarkerStyle(*marker=None, fillstyle=None*)

Bases: `object`

#### Parameters

**marker** [string or array\_like, optional, default: None] See the descriptions of possible markers in the module docstring.

**fillstyle** [string, optional, default: 'full'] 'full', 'left', 'right', 'bottom', 'top', 'none'

#### Attributes

**markers** [list of known marks]

**fillstyles** [list of known fillstyles]

**filled\_markers** [list of known filled markers.]

filled\_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '\*', 'h', 'H', 'D', 'd', 'P', 'X')

fillstyles = ('full', 'left', 'right', 'bottom', 'top', 'none')

get\_alt\_path()

get\_alt\_transform()

get\_capstyle()

get\_fillstyle()

get\_joinstyle()

get\_marker()

get\_path()

get\_snap\_threshold()

get\_transform()

is\_filled()

```
markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triangle_up', 'x': 'cross', 'D': 'diamond', 's': 'square', 'p': 'pentagon', 't': 'triangle_up', 'T': 'triangle_down', 'd': 'diamond', 'x': 'cross', 's': 'square', 'p': 'pentagon', 't': 'triangle_up', 'T': 'triangle_down'}  
set_fillstyle(fillstyle)  
    Sets fillstyle
```

**Parameters**

**fillstyle** [string amongst known fillstyles]

```
set_marker(marker)
```

## 18.27 mathtext

### 18.27.1 matplotlib.mathtext

*mathtext* is a module for parsing a subset of the TeX math syntax and drawing them to a matplotlib backend.

For a tutorial of its usage see [Writing mathematical expressions](#). This document is primarily concerned with implementation details.

The module uses `pyparsing` to parse the TeX expression.

The Bakoma distribution of the TeX Computer Modern fonts, and STIX fonts are supported. There is experimental support for using arbitrary fonts, but results may vary without proper tweaking and metrics for those fonts.

```
class matplotlib.mathtext.Accent(c, state, math=True)
```

Bases: `matplotlib.mathtext.Char`

The font metrics need to be dealt with differently for accents, since they are already offset correctly from the baseline in TrueType fonts.

```
grow()
```

Grows one level larger. There is no limit to how big something can get.

```
render(x, y)
```

Render the character to the canvas.

```
shrink()
```

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

```
class matplotlib.mathtext.AutoHeightChar(c, height, depth, state, always=False, factor=None)
```

Bases: `matplotlib.mathtext.Hlist`

`AutoHeightChar` will create a character as close to the given height and depth as possible. When using a font with multiple height versions of some characters (such as the BaKoMa fonts), the correct glyph will be selected, otherwise this will always just return a scaled version of the glyph.

```
class matplotlib.mathtext.AutoWidthChar(c, width, state, always=False, char_class=<class matplotlib.mathtext.Char>)
```

Bases: `matplotlib.mathtext.Hlist`

`AutoWidthChar` will create a character as close to the given width as possible. When using a font with multiple width versions of some characters (such as the BaKoMa fonts), the correct glyph will be selected, otherwise this will always just return a scaled version of the glyph.

```
class matplotlib.mathtext.BakomaFonts(*args, **kwargs)
```

Bases: `matplotlib.mathtext.TruetypeFonts`

Use the Bakoma TrueType fonts for rendering.

Symbols are strewn about a number of font files, each of which has its own proprietary 8-bit encoding.

```
alias = '\\\]
```

```
get_sized_alternatives_for_symbol(fontname, sym)
```

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching `sym` in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

```
target = '\]
```

```
class matplotlib.mathtext.Box(width, height, depth)
```

Bases: `matplotlib.mathtext.Node`

Represents any node with a physical location.

`grow()`  
Grows one level larger. There is no limit to how big something can get.

`render(x1, y1, x2, y2)`

`shrink()`  
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.Char(c, state, math=True)`

Bases: `matplotlib.mathtext.Node`

Represents a single character. Unlike TeX, the font information and metrics are stored with each `Char` to make it easier to lookup the font metrics when needed. Note that TeX boxes have a width, height, and depth, unlike Type1 and Truetype which use a full bounding box and an advance in the x-direction. The metrics must be converted to the TeX way, and the advance (if different from width) must be converted into a `Kern` node when the `Char` is added to its parent `Hlist`.

`get_kerning(next)`  
Return the amount of kerning between this and the given character. Called when characters are strung together into `Hlist` to create `Kern` nodes.

`grow()`  
Grows one level larger. There is no limit to how big something can get.

`is_slanted()`

`render(x, y)`  
Render the character to the canvas

`shrink()`  
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.ComputerModernFontConstants`

Bases: `matplotlib.mathtext.FontConstantsBase`

`delta = 0.075`

`delta_integral = 0.3`

`delta_slanted = 0.3`

`script_space = 0.075`

`sub1 = 0.2`

`sub2 = 0.3`

`subdrop = 0.2`

`sup1 = 0.45`

`class matplotlib.mathtext.DejaVuFonts(*args, **kwargs)`

Bases: `matplotlib.mathtext.UnicodeFonts`

`use_cmex = False`

`class matplotlib.mathtext.DejaVuSansFontConstants`

Bases: `matplotlib.mathtext.FontConstantsBase`

`class matplotlib.mathtext.DejaVuSansFonts(*args, **kwargs)`

Bases: `matplotlib.mathtext.DejaVuFonts`

A font handling class for the DejaVu Sans fonts

If a glyph is not found it will fallback to Stix Sans

```
class matplotlib.mathtext.DejaVuSerifFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase
```

```
class matplotlib.mathtext.DejaVuSerifFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.DejaVuFonts
```

A font handling class for the DejaVu Serif fonts

If a glyph is not found it will fallback to Stix Serif

```
matplotlib.mathtext.Error(msg)
    Helper class to raise parser errors.
```

```
class matplotlib.mathtext.Fill
    Bases: matplotlib.mathtext.Glue
```

```
class matplotlib.mathtext.Fill1
    Bases: matplotlib.mathtext.Glue
```

```
class matplotlib.mathtext.Fill11
    Bases: matplotlib.mathtext.Glue
```

```
class matplotlib.mathtext.FontConstantsBase
    Bases: object
```

A set of constants that controls how certain things, such as sub- and superscripts are laid out. These are all metrics that can't be reliably retrieved from the font metrics in the font itself.

```
delta = 0.025
```

```
delta_integral = 0.1
```

```
delta_slanted = 0.2
```

```
script_space = 0.05
```

```
sub1 = 0.3
```

```
sub2 = 0.5
```

```
subdrop = 0.4
```

```
sup1 = 0.7
```

```
class matplotlib.mathtext.Fonts(default_font_prop, mathtext_backend)
    Bases: object
```

An abstract base class for a system of fonts to use for mathtext.

The class must be able to take symbol keys and font file names and return the character metrics. It also delegates to a backend class to do the actual drawing.

*default\_font\_prop*: A *FontProperties* object to use for the default non-math font, or the base font for Unicode (generic) font rendering.

*mathtext\_backend*: A subclass of *MathTextBackend* used to delegate the actual rendering.

```
destroy()
    Fix any cyclical references before the object is about to be destroyed.
```

`get_kern(font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)`  
 Get the kerning distance for font between *sym1* and *sym2*.

*fontX*: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

*fontclassX*: TODO

*symX*: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

*fontsizeX*: the fontsize in points

*dpi*: the current dots-per-inch

`get_metrics(font, font_class, sym, fontsize, dpi, math=True)`

*font*: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

*font\_class*: TODO

*sym*: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

*fontsize*: font size in points

*dpi*: current dots-per-inch

*math*: whether sym is a math character

Returns an object with the following attributes:

- *advance*: The advance distance (in points) of the glyph.
- *height*: The height of the glyph in points.
- *width*: The width of the glyph in points.
- *xmin, xmax, ymin, ymax* - the ink rectangle of the glyph
- *iceberg* - the distance from the baseline to the top of the glyph. This corresponds to TeX's definition of "height".

`get_results(box)`

Get the data needed by the backend to render the math expression. The return value is backend-specific.

`get_sized_alternatives_for_symbol(fontname, sym)`

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

`get_underline_thickness(font, fontsize, dpi)`

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

`get_used_characters()`

Get the set of characters that were used in the math expression. Used by backends that need to subset fonts so they know which glyphs to include.

`get_xheight(font, fontsize, dpi)`

Get the xheight for the given *font* and *fontsize*.

`render_glyph(ox, oy, facename, font_class, sym, fontsize, dpi)`

Draw a glyph at

- *ox, oy*: position
- *facename*: One of the TeX face names
- *font\_class*:
- *sym*: TeX symbol name or single character
- *fontsize*: fontsize in points
- *dpi*: The dpi to draw at.

`render_rect_filled(x1, y1, x2, y2)`  
 Draw a filled rectangle from (x1, y1) to (x2, y2).

`set_canvas_size(w, h, d)`  
 Set the size of the buffer used to render the math expression. Only really necessary for the bitmap backends.

`class matplotlib.mathtext.Glue(glue_type, copy=False)`  
 Bases: `matplotlib.mathtext.Node`

Most of the information in this object is stored in the underlying `GlueSpec` class, which is shared between multiple glue objects. (This is a memory optimization which probably doesn't matter anymore, but it's easier to stick to what TeX does.)

`grow()`  
 Grows one level larger. There is no limit to how big something can get.

`shrink()`  
 Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.GlueSpec(width=0.0, stretch=0.0, stretch_order=0,  
shrink=0.0, shrink_order=0)`

Bases: `object`

See `Glue`.

`copy()`

`classmethod factory(glue_type)`

`class matplotlib.mathtext.HCentered(elements)`  
 Bases: `matplotlib.mathtext.HList`

A convenience class to create an `HList` whose contents are centered within its enclosing box.

`class matplotlib.mathtext.Hbox(width)`  
 Bases: `matplotlib.mathtext.Box`

A box with only width (zero height and depth).

`class matplotlib.mathtext.HList(elements, w=0.0, m='additional', do_kern=True)`  
 Bases: `matplotlib.mathtext.List`

A horizontal list of boxes.

`hpack(w=0.0, m='additional')`

The main duty of `hpack()` is to compute the dimensions of the resulting boxes, and to adjust the glue if one of those dimensions is pre-specified. The computed sizes normally enclose all of the material inside the new box; but some items may stick out if negative glue is used, if the box is overfull, or if a `\vbox` includes other boxes that have been shifted left.

- *w*: specifies a width
- *m*: is either 'exactly' or 'additional'.

Thus, `hpack(w, 'exactly')` produces a box whose width is exactly *w*, while `hpack(w, 'additional')` yields a box whose width is the natural width plus *w*. The default values produce a box with the natural width.

`kern()`

Insert *Kern* nodes between *Char* nodes to set kerning. The *Char* nodes themselves determine the amount of kerning they need (in `get_kerning()`), and this function just creates the linked list in the correct way.

`class matplotlib.mathtext.Hrule(state, thickness=None)`

Bases: `matplotlib.mathtext.Rule`

Convenience class to create a horizontal rule.

`class matplotlib.mathtext.Kern(width)`

Bases: `matplotlib.mathtext.Node`

A *Kern* node has a *width* field to specify a (normally negative) amount of spacing. This spacing correction appears in horizontal lists between letters like A and V when the font designer said that it looks better to move them closer together or further apart. A kern node can also appear in a vertical list, when its *width* denotes additional spacing in the vertical direction.

`depth = 0`

`grow()`

Grows one level larger. There is no limit to how big something can get.

`height = 0`

`shrink()`

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.List(elements)`

Bases: `matplotlib.mathtext.Box`

A list of nodes (either horizontal or vertical).

`grow()`

Grows one level larger. There is no limit to how big something can get.

`shrink()`

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.MathTextParser(output)`

Bases: `object`

Create a `MathTextParser` for the given backend *output*.

`get_depth(texstr, dpi=120, fontsize=14)`

Returns the offset of the baseline from the bottom of the image in pixels.

***texstr*** A valid mathtext string, e.g., `r'IQ: \sigma_i=15$'`

***dpi*** The dots-per-inch to render the text

***fontsize*** The font size in points

`parse`

Parse the given math expression *s* at the given *dpi*. If *prop* is provided, it is a *FontProperties* object specifying the "default" font to use in the math expression, used for all non-math text.

The results are cached, so multiple calls to `parse()` with the same expression should be fast.

`to_mask(texstr, dpi=120, fontsize=14)`

***texstr*** A valid mathtext string, e.g., `r'IQ: $sigma_i=15$'`

***dpi*** The dots-per-inch to render the text

***fontsize*** The font size in points

Returns a tuple (*array*, *depth*)

- *array* is an NxM uint8 alpha ubyte mask array of rasterized tex.
- *depth* is the offset of the baseline from the bottom of the image in pixels.

`to_png(filename, texstr, color='black', dpi=120, fontsize=14)`

Writes a tex expression to a PNG file.

Returns the offset of the baseline from the bottom of the image in pixels.

***filename*** A writable filename or fileobject

***texstr*** A valid mathtext string, e.g., `r'IQ: $sigma_i=15$'`

***color*** A valid matplotlib color argument

***dpi*** The dots-per-inch to render the text

***fontsize*** The font size in points

Returns the offset of the baseline from the bottom of the image in pixels.

`to_rgba(texstr, color='black', dpi=120, fontsize=14)`

***texstr*** A valid mathtext string, e.g., `r'IQ: $sigma_i=15$'`

***color*** Any matplotlib color argument

***dpi*** The dots-per-inch to render the text

***fontsize*** The font size in points

Returns a tuple (*array*, *depth*)

- *array* is an NxM uint8 alpha ubyte mask array of rasterized tex.
- *depth* is the offset of the baseline from the bottom of the image in pixels.

exception `matplotlib.mathtext.MathTextWarning`

Bases: `Warning`

class `matplotlib.mathtext.MathtextBackend`

Bases: `object`

The base class for the mathtext backend-specific code. The purpose of *MathtextBackend* subclasses is to interface between mathtext and a specific matplotlib graphics backend.

Subclasses need to override the following:

- `render_glyph()`
- `render_rect_filled()`

- `get_results()`

And optionally, if you need to use a FreeType hinting style:

- `get_hinting_type()`

`get_hinting_type()`

Get the FreeType hinting type to use with this particular backend.

`get_results(box)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(ox, oy, info)`

Draw a glyph described by *info* to the reference point (*ox*, *oy*).

`render_rect_filled(x1, y1, x2, y2)`

Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

`set_canvas_size(w, h, d)`

Dimension the drawing canvas

`class matplotlib.mathtext.MathtextBackendAgg`

Bases: `matplotlib.mathtext.MathtextBackend`

Render glyphs and rectangles to an FTImage buffer, which is later transferred to the Agg image by the Agg backend.

`get_hinting_type()`

Get the FreeType hinting type to use with this particular backend.

`get_results(box, used_characters)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(ox, oy, info)`

Draw a glyph described by *info* to the reference point (*ox*, *oy*).

`render_rect_filled(x1, y1, x2, y2)`

Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

`set_canvas_size(w, h, d)`

Dimension the drawing canvas

`class matplotlib.mathtext.MathtextBackendBitmap`

Bases: `matplotlib.mathtext.MathtextBackendAgg`

`get_results(box, used_characters)`

Return a backend-specific tuple to return to the backend after all processing is done.

`class matplotlib.mathtext.MathtextBackendCairo`

Bases: `matplotlib.mathtext.MathtextBackend`

Store information to write a mathtext rendering to the Cairo backend.

`get_results(box, used_characters)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(ox, oy, info)`

Draw a glyph described by *info* to the reference point (*ox*, *oy*).

`render_rect_filled(x1, y1, x2, y2)`

Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

`class matplotlib.mathtext.MathtextBackendPath`

Bases: `matplotlib.mathtext.MathtextBackend`

Store information to write a mathtext rendering to the text path machinery.

`get_results(box, used_characters)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(ox, oy, info)`

Draw a glyph described by *info* to the reference point (*ox*, *oy*).

`render_rect_filled(x1, y1, x2, y2)`

Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

`class matplotlib.mathtext.MathtextBackendPdf`

Bases: `matplotlib.mathtext.MathtextBackend`

Store information to write a mathtext rendering to the PDF backend.

`get_results(box, used_characters)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(ox, oy, info)`

Draw a glyph described by *info* to the reference point (*ox*, *oy*).

`render_rect_filled(x1, y1, x2, y2)`

Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

`class matplotlib.mathtext.MathtextBackendPs`

Bases: `matplotlib.mathtext.MathtextBackend`

Store information to write a mathtext rendering to the PostScript backend.

`get_results(box, used_characters)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(ox, oy, info)`

Draw a glyph described by *info* to the reference point (*ox*, *oy*).

`render_rect_filled(x1, y1, x2, y2)`

Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

`class matplotlib.mathtext.MathtextBackendSvg`

Bases: `matplotlib.mathtext.MathtextBackend`

Store information to write a mathtext rendering to the SVG backend.

`get_results(box, used_characters)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph(ox, oy, info)`

Draw a glyph described by *info* to the reference point (*ox*, *oy*).

`render_rect_filled(x1, y1, x2, y2)`

Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

`class matplotlib.mathtext.NegFil`

Bases: `matplotlib.mathtext.Glue`

`class matplotlib.mathtext.NegFill`

Bases: `matplotlib.mathtext.Glue`

`class matplotlib.mathtext.NegFill1`

Bases: `matplotlib.mathtext.Glue`

`class matplotlib.mathtext.Node`

Bases: `object`

A node in the TeX box model

`get_kerning(next)`

`grow()`

Grows one level larger. There is no limit to how big something can get.

`render(x, y)`

`shrink()`

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.Parser`

Bases: `object`

This is the pyparsing-based parser for math expressions. It actually parses full strings containing math expressions, in that raw text may also appear outside of pairs of \$.

The grammar is based directly on that in TeX, though it cuts a few corners.

`class State(font_output, font, font_class, fontsize, dpi)`

Bases: `object`

Stores the state of the parser.

States are pushed and popped from a stack as necessary, and the "current" state is always at the top of the stack.

`copy()`

`font`

`accent(s, loc, toks)`

`auto_delim(s, loc, toks)`

`binom(s, loc, toks)`

`c_over_c(s, loc, toks)`

`customspace(s, loc, toks)`

`dfrac(s, loc, toks)`

`end_group(s, loc, toks)`

`font(s, loc, toks)`

`frac(s, loc, toks)`

`function(s, loc, toks)`

`genfrac(s, loc, toks)`

`get_state()`

Get the current *State* of the parser.

`group(s, loc, toks)`

`is_between_brackets(s, loc)`

`is_dropsup(nucleus)`

`is_overunder(nucleus)`

`is_slanted(nucleus)`

`main(s, loc, toks)`

```

math(s, loc, toks)
math_string(s, loc, toks)
non_math(s, loc, toks)
operatorname(s, loc, toks)
overline(s, loc, toks)
parse(s, fonts_object, fontsize, dpi)
    Parse expression s using the given fonts_object for output, at the given fontsize and
    dpi.
    Returns the parse tree of Node instances.
pop_state()
    Pop a State off of the stack.
push_state()
    Push a new State onto the stack which is just a copy of the current state.
required_group(s, loc, toks)
simple_group(s, loc, toks)
snowflake(s, loc, toks)
space(s, loc, toks)
sqrt(s, loc, toks)
stackrel(s, loc, toks)
start_group(s, loc, toks)
subsuper(s, loc, toks)
symbol(s, loc, toks)
unknown_symbol(s, loc, toks)
class matplotlib.mathtext.Rule(width, height, depth, state)
    Bases: matplotlib.mathtext.Box
    A Rule node stands for a solid black rectangle; it has width, depth, and height fields
    just as in an Hlist. However, if any of these dimensions is inf, the actual value will be
    determined by running the rule up to the boundary of the innermost enclosing box. This
    is called a "running dimension." The width is never running in an Hlist; the height and
    depth are never running in a Vlist.
    render(x, y, w, h)
class matplotlib.mathtext.STIXFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase
    delta = 0.05
    delta_integral = 0.3
    delta_slanted = 0.3
    script_space = 0.1
    sub2 = 0.6
    sup1 = 0.8

```

```
class matplotlib.mathtext.STIXSansFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase

    delta_integral = 0.3
    delta_slanted = 0.6
    script_space = 0.05
    sup1 = 0.8
```

```
class matplotlib.mathtext.Ship
    Bases: object
```

Once the boxes have been set up, this sends them to output. Since boxes can be inside of boxes inside of boxes, the main work of *Ship* is done by two mutually recursive routines, *hlist\_out()* and *vlist\_out()*, which traverse the *Hlist* nodes and *Vlist* nodes inside of horizontal and vertical boxes. The global variables used in TeX to store state as it processes have become member variables here.

```
    static clamp(value)
```

```
    hlist_out(box)
```

```
    vlist_out(box)
```

```
class matplotlib.mathtext.SsGlue
    Bases: matplotlib.mathtext.Glue
```

```
class matplotlib.mathtext.StandardPsFonts(default_font_prop)
    Bases: matplotlib.mathtext.Fonts
```

Use the standard postscript fonts for rendering to backend\_ps

Unlike the other font classes, *BakomaFont* and *UnicodeFont*, this one requires the Ps backend.

```
basepath = '/tmp/mpl_doc_build/lib/python3.7/site-packages/matplotlib/mpl-data/fonts/afm'
```

```
fontmap = {'cal': 'pzcmi8a', 'rm': 'pnocr8a', 'tt': 'pcrr8a', 'it': 'pncri8a', 'sf': 'phvr8a', 'bf': 'pncr8a'}
```

```
get_kern(font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)
```

Get the kerning distance for font between *sym1* and *sym2*.

*fontX*: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

*fontclassX*: TODO

*symX*: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

*fontsizeX*: the fontsize in points

*dpi*: the current dots-per-inch

```
get_underline_thickness(font, fontsize, dpi)
```

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

```
get_xheight(font, fontsize, dpi)
```

Get the xheight for the given *font* and *fontsize*.

```
class matplotlib.mathtext.StixFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.UnicodeFonts
```

A font handling class for the STIX fonts.

In addition to what UnicodeFonts provides, this class:

- supports “virtual fonts” which are complete alpha numeric character sets with different font styles at special Unicode code points, such as “Blackboard”.
- handles sized alternative characters for the STIXSizeX fonts.

```
cm_fallback = False
```

```
get_sized_alternatives_for_symbol(fontname, sym)
```

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

```
use_cmex = False
```

```
class matplotlib.mathtext.StixSansFonts(*args, **kwargs)
```

Bases: `matplotlib.mathtext.StixFonts`

A font handling class for the STIX fonts (that uses sans-serif characters by default).

```
class matplotlib.mathtext.SubSuperCluster
```

Bases: `matplotlib.mathtext.Hlist`

*SubSuperCluster* is a sort of hack to get around that fact that this code do a two-pass parse like TeX. This lets us store enough information in the hlist itself, namely the nucleus, sub- and super-script, such that if another script follows that needs to be attached, it can be reconfigured on the fly.

```
class matplotlib.mathtext.TruetypeFonts(default_font_prop, mathtext_backend)
```

Bases: `matplotlib.mathtext.Fonts`

A generic base class for all font setups that use Truetype fonts (through FT2Font).

```
destroy()
```

Fix any cyclical references before the object is about to be destroyed.

```
get_kern(font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)
```

Get the kerning distance for font between *sym1* and *sym2*.

*fontX*: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

*fontclassX*: TODO

*symX*: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

*fontsizeX*: the fontsize in points

*dpi*: the current dots-per-inch

```
get_underline_thickness(font, fontsize, dpi)
```

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

```
get_xheight(fontname, fontsize, dpi)
```

Get the xheight for the given *font* and *fontsize*.

```
class matplotlib.mathtext.UnicodeFonts(*args, **kwargs)
```

Bases: `matplotlib.mathtext.TruetypeFonts`

An abstract base class for handling Unicode fonts.

While some reasonably complete Unicode fonts (such as DejaVu) may work in some situations, the only Unicode font I'm aware of with a complete set of math symbols is STIX.

This class will "fallback" on the Bakoma fonts when a required symbol can not be found in the font.

`get_sized_alternatives_for_symbol(fontname, sym)`

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

`use_cmex = True`

`class matplotlib.mathtext.VCentered(elements)`

Bases: `matplotlib.mathtext.Hlist`

A convenience class to create a *Vlist* whose contents are centered within its enclosing box.

`class matplotlib.mathtext.Vbox(height, depth)`

Bases: `matplotlib.mathtext.Box`

A box with only height (zero width).

`class matplotlib.mathtext.Vlist(elements, h=0.0, m='additional')`

Bases: `matplotlib.mathtext.List`

A vertical list of boxes.

`vpack(h=0.0, m='additional', l=inf)`

The main duty of `vpack()` is to compute the dimensions of the resulting boxes, and to adjust the glue if one of those dimensions is pre-specified.

- *h*: specifies a height
- *m*: is either 'exactly' or 'additional'.
- *l*: a maximum height

Thus, `vpack(h, 'exactly')` produces a box whose height is exactly *h*, while `vpack(h, 'additional')` yields a box whose height is the natural height plus *h*. The default values produce a box with the natural width.

`class matplotlib.mathtext.Vrule(state)`

Bases: `matplotlib.mathtext.Rule`

Convenience class to create a vertical rule.

`matplotlib.mathtext.get_unicode_index(symbol[, bool])` → integer

Return the integer index (from the Unicode table) of *symbol*. *symbol* can be a single unicode character, a TeX command (i.e. `r'pi'`), or a Type1 symbol name (i.e. `'phi'`). If *math* is False, the current symbol should be treated as a non-math symbol.

`matplotlib.mathtext.math_to_image(s, filename_or_obj, prop=None, dpi=None, format=None)`

Given a math expression, renders it in a closely-clipped bounding box to an image file.

**s** A math expression. The math portion should be enclosed in dollar signs.

**filename\_or\_obj** A filepath or writable file-like object to write the image data to.

**prop** If provided, a `FontProperties()` object describing the size and style of the text.

**dpi** Override the output dpi, otherwise use the default associated with the output format.

**format** The output format, e.g., 'svg', 'pdf', 'ps' or 'png'. If not provided, will be deduced from the filename.

## 18.28 mlab

### 18.28.1 matplotlib.mlab

Numerical python functions written for compatibility with MATLAB commands with the same names.

#### MATLAB compatible functions

*cohere()* Coherence (normalized cross spectral density)

*csd()* Cross spectral density using Welch's average periodogram

*detrend()* Remove the mean or best fit line from an array

*find()* Return the indices where some condition is true; `numpy.nonzero` is similar but more general.

*griddata()* Interpolate irregularly distributed data to a regular grid.

*prctile()* Find the percentiles of a sequence

*prepca()* Principal Component Analysis

*psd()* Power spectral density using Welch's average periodogram

*rk4()* A 4th order runge kutta integrator for 1D or ND systems

*specgram()* Spectrogram (spectrum over segments of time)

#### Miscellaneous functions

Functions that don't exist in MATLAB, but are useful anyway:

*cohere\_pairs()* Coherence over all pairs. This is not a MATLAB function, but we compute coherence a lot in my lab, and we compute it for a lot of pairs. This function is optimized to do this efficiently by caching the direct FFTs.

*rk4()* A 4th order Runge-Kutta ODE integrator in case you ever find yourself stranded without `scipy` (and the far superior `scipy.integrate` tools)

*contiguous\_regions()* Return the indices of the regions spanned by some logical mask

*cross\_from\_below()* Return the indices where a 1D array crosses a threshold from below

*cross\_from\_above()* Return the indices where a 1D array crosses a threshold from above

*complex\_spectrum()* Return the complex-valued frequency spectrum of a signal

*magnitude\_spectrum()* Return the magnitude of the frequency spectrum of a signal

*angle\_spectrum()* Return the angle (wrapped phase) of the frequency spectrum of a signal

*phase\_spectrum()* Return the phase (unwrapped angle) of the frequency spectrum of a signal

*detrend\_mean()* Remove the mean from a line.

`demean()` Remove the mean from a line. This function is the same as `detrend_mean()` except for the default *axis*.

`detrend_linear()` Remove the best fit line from a line.

`detrend_none()` Return the original line.

`stride_windows()` Get all windows in an array in a memory-efficient manner

`stride_repeat()` Repeat an array in a memory-efficient manner

`apply_window()` Apply a window along a given axis

### record array helper functions

A collection of helper methods for numpyrecord arrays

See `misc-examples-index`

`rec2txt()` Pretty print a record array

`rec2csv()` Store record array in CSV file

`csv2rec()` Import record array from CSV file with type inspection

`rec_append_fields()` Adds field(s)/array(s) to record array

`rec_drop_fields()` Drop fields from record array

`rec_join()` Join two record arrays on sequence of fields

`recs_join()` A simple join of multiple recarrays using a single column as a key

`rec_groupby()` Summarize data by groups (similar to SQL GROUP BY)

`rec_summarize()` Helper code to filter rec array fields into new fields

For the rec viewer functions(e `rec2csv`), there are a bunch of Format objects you can pass into the functions that will do things like color negative values red, set percent formatting and scaling, etc.

Example usage:

```
r = csv2rec('somefile.csv', checkrows=0)

formatd = dict(
    weight = FormatFloat(2),
    change = FormatPercent(2),
    cost   = FormatThousands(2),
)

rec2excel(r, 'test.xls', formatd=formatd)
rec2csv(r, 'test.csv', formatd=formatd)
```

```
class matplotlib.mlab.FormatBool(**kwargs)
```

Bases: `matplotlib.mlab.FormatObj`

Deprecated since version 2.2: The FormatBool class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

`fromstr(s)`

`toval(x)`

```
class matplotlib.mlab.FormatDate(**kwargs)
```

```
    Bases: matplotlib.mlab.FormatObj
```

Deprecated since version 2.2: The FormatDate class was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `date.strptime` instead.

```
    fromstr(x)
```

```
    toval(x)
```

```
class matplotlib.mlab.FormatDatetime(**kwargs)
```

```
    Bases: matplotlib.mlab.FormatDate
```

Deprecated since version 2.2: The FormatDatetime class was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `datetime.strptime` instead.

```
    fromstr(x)
```

```
class matplotlib.mlab.FormatFloat(**kwargs)
```

```
    Bases: matplotlib.mlab.FormatFormatStr
```

Deprecated since version 2.2: The FormatFloat class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

```
    fromstr(s)
```

```
    toval(x)
```

```
class matplotlib.mlab.FormatFormatStr(**kwargs)
```

```
    Bases: matplotlib.mlab.FormatObj
```

Deprecated since version 2.2: The FormatFormatStr class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

```
    tostr(x)
```

```
class matplotlib.mlab.FormatInt(**kwargs)
```

```
    Bases: matplotlib.mlab.FormatObj
```

Deprecated since version 2.2: The FormatInt class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

```
    fromstr(s)
```

```
    tostr(x)
```

```
    toval(x)
```

```
class matplotlib.mlab.FormatMillions(**kwargs)
```

```
    Bases: matplotlib.mlab.FormatFloat
```

Deprecated since version 2.2: The FormatMillions class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

```
class matplotlib.mlab.FormatObj(**kwargs)
```

```
    Bases: object
```

Deprecated since version 2.2: The FormatObj class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

```
    fromstr(s)
```

```
    tostr(x)
```

```
    toval(x)
```

```
class matplotlib.mlab.FormatPercent(**kwargs)
```

Bases: `matplotlib.mlab.FormatFloat`

Deprecated since version 2.2: The FormatPercent class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

```
class matplotlib.mlab.FormatString(**kwargs)
```

Bases: `matplotlib.mlab.FormatObj`

Deprecated since version 2.2: The FormatString class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

```
tostr(x)
```

```
class matplotlib.mlab.FormatThousands(**kwargs)
```

Bases: `matplotlib.mlab.FormatFloat`

Deprecated since version 2.2: The FormatThousands class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

```
class matplotlib.mlab.GaussianKDE(dataset, bw_method=None)
```

Bases: `object`

Representation of a kernel-density estimate using Gaussian kernels.

### Parameters

**dataset** [array\_like] Datapoints to estimate from. In case of univariate data this is a 1-D array, otherwise a 2-D array with shape (# of dims, # of data).

**bw\_method** [str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a `GaussianKDE` instance as only parameter and return a scalar. If None (default), 'scott' is used.

### Attributes

**dataset** [ndarray] The dataset with which `gaussian_kde` was initialized.

**dim** [int] Number of dimensions.

**num\_dp** [int] Number of datapoints.

**factor** [float] The bandwidth factor, obtained from `kde.covariance_factor`, with which the covariance matrix is multiplied.

**covariance** [ndarray] The covariance matrix of `dataset`, scaled by the calculated bandwidth (`kde.factor`).

**inv\_cov** [ndarray] The inverse of `covariance`.

### Methods

<b>kde.evaluate(points)</b>	(ndarray) Evaluate the estimated pdf on a provided set of points.
<b>kde(points)</b>	(ndarray) Same as <code>kde.evaluate(points)</code>

```
covariance_factor()
```

`evaluate(points)`

Evaluate the estimated pdf on a set of points.

### Parameters

**points** [(# of dimensions, # of points)-array] Alternatively, a (# of dimensions,) vector can be passed in and treated as a single point.

### Returns

**values** [(# of points,)-array] The values at each point.

### Raises

**ValueError** [if the dimensionality of the input points is different] than the dimensionality of the KDE.

`scotts_factor()`

`silverman_factor()`

`class matplotlib.mlab.PCA(**kwargs)`

Bases: `object`

Deprecated since version 2.2: The PCA class was deprecated in Matplotlib 2.2 and will be removed in 3.1.

`center(x)`

center and optionally standardize the data using the mean and sigma from training set a

`project(x, minfrac=0.0)`

project x onto the principle axes, dropping any axes where fraction of variance < minfrac

`matplotlib.mlab.amap(fn, *args)`

Deprecated since version 2.2: The amap function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `numpy.array(list(map(...)))` instead.

`amap(function, sequence[, sequence, ...]) -> array.`

Works like `map()`, but it returns an array. This is just a convenient shorthand for `numpy.array(map(...))`.

`matplotlib.mlab.angle_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)`

Compute the angle of the frequency spectrum (wrapped phase spectrum) of x. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.

**window** [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

### Returns

**spectrum** [1-D array] The values for the angle spectrum in radians (real valued)

**freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*

### See also:

`complex_spectrum()` This function returns the angle value of `complex_spectrum()`.

`magnitude_spectrum()` `angle_spectrum()` returns the magnitudes of the corresponding frequencies.

`phase_spectrum()` `phase_spectrum()` returns the unwrapped version of this function.

`specgram()` `specgram()` can return the angle spectrum of segments within the signal.

`matplotlib.mlab.apply_window(x, window, axis=0, return_window=None)`

Apply the given window to the given 1D or 2D array along the given axis.

### Parameters

**x** [1D or 2D array or sequence] Array or sequence containing the data.

**window** [function or array.] Either a function to generate a window or an array with length `x.shape[axis]`

**axis** [integer] The axis over which to do the repetition. Must be 0 or 1. The default is 0

**return\_window** [bool] If true, also return the 1D values of the window that was applied

`matplotlib.mlab.base_repr(number, base=2, padding=0)`

Deprecated since version 2.2: The `base_repr` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return the representation of a *number* in any given *base*.

`matplotlib.mlab.binary_repr(number, max_length=1025)`

Deprecated since version 2.2: The `binary_repr` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return the binary representation of the input *number* as a string.

This is more efficient than using `base_repr()` with base 2.

Increase the value of `max_length` for very large numbers. Note that on 32-bit machines, `2**1023` is the largest integer power of 2 which can be converted to a Python float.

```
matplotlib.mlab.bivariate_normal(X, Y, sigmax=1.0, sigmay=1.0, mux=0.0, muy=0.0,
                                sigmaxy=0.0)
```

Deprecated since version 2.2: The `bivariate_normal` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Bivariate Gaussian distribution for equal shape  $X, Y$ .

See [bivariate normal](#) at mathworld.

```
matplotlib.mlab.center_matrix(M, dim=0)
```

Deprecated since version 2.2: The `center_matrix` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return the matrix  $M$  with each row having zero mean and unit std.

If  $dim = 1$  operate on columns instead of rows. ( $dim$  is opposite to the numpy axis kwarg.)

```
matplotlib.mlab.cohere(x, y, NFFT=256, Fs=2, detrend=<function detrend_none>, window=
<function window_hanning>, noverlap=0, pad_to=None, sides='default', scale_by_freq=None)
```

The coherence between  $x$  and  $y$ . Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}} \quad (18.4)$$

## Parameters

**x, y** Array or sequence containing the data

**Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.

**window** [callable or ndarray] A function or a vector of length  $NFFT$ . To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from  $NFFT$ , which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to  $NFFT$ .

**NFFT** [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use `pad_to` for this instead.

**detrend** [{'default', 'constant', 'mean', 'linear', 'none'} or callable] The function applied to each segment before `fft`-ing, designed to remove

the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib it is a function. The *mlab* module defines *detrend\_none()*, *detrend\_mean()*, and *detrend\_linear()*, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call *detrend\_mean()*. 'linear' calls *detrend\_linear()*. 'none' calls *detrend\_none()*.

**scale\_by\_freq** [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [integer] The number of points of overlap between blocks. The default value is 0 (no overlap).

### Returns

**The return value is the tuple (\*Cxy\*, \*f\*), where \*f\* are the frequencies of the coherence vector. For cohere, scaling the individual densities by the sampling frequency has no effect, since the factors cancel out.**

### See also:

*psd()*, *csd()*

```
matplotlib.mlab.cohere_pairs(X, ij, NFFT=256, Fs=2, detrend=<function de-
    trend_none>, window=<function window_hanning>,
    noverlap=0, preferSpeedOverMemory=True, pro-
    gressCallback=<function donothing_callback>, re-
    turnPxx=False)
```

Deprecated since version 2.2: `scipy.signal.coherence`

Compute the coherence and phase for all pairs *ij*, in *X*.

*X* is a *numSamples* \* *numCols* array

*ij* is a list of tuples. Each tuple is a pair of indexes into the columns of *X* for which you want to compute coherence. For example, if *X* has 64 columns, and you want to compute all nonredundant pairs, define *ij* as:

```
ij = []
for i in range(64):
    for j in range(i+1,64):
        ij.append( (i,j) )
```

*preferSpeedOverMemory* is an optional bool. Defaults to true. If False, limits the caching by only making one, rather than two, complex cache arrays. This is useful if memory becomes critical. Even when *preferSpeedOverMemory* is False, *cohere\_pairs()* will still give significant performance gains over calling *cohere()* for each pair, and will use substantially less memory than if *preferSpeedOverMemory* is True. In my tests with a 43000,64 array over all nonredundant pairs, *preferSpeedOverMemory* = True delivered a 33% performance boost on a 1.7GHZ Athlon with 512MB RAM compared with *preferSpeedOverMemory* = False. But both solutions were more than 10x faster than naively crunching all possible pairs through *cohere()*.

### Returns

**Cxy** [dictionary of  $(i, j)$  tuples  $\rightarrow$  coherence vector for] that pair. i.e.,  $Cxy[(i, j)] = \text{cohere}(X[:, i], X[:, j])$ . Number of dictionary keys is  $\text{len}(ij)$ .

**Phase** [dictionary of phases of the cross spectral density at] each frequency for each pair. Keys are  $(i, j)$ .

**freqs** [vector of frequencies, equal in length to either the] coherence or phase vectors for any  $(i, j)$  key.

**e.g., to make a coherence Bode plot::** `subplot(211) plot( freqs, Cxy[(12,19)]) subplot(212) plot( freqs, Phase[(12,19)])`

**For a large number of pairs, `:func:'cohere_pairs'` can be much more**

**efficient than just calling `:func:'cohere'` for each pair, because it caches most of the intensive computations. If `:math:'N'` is the number of pairs, this function is `:math:'O(N)'` for most of the heavy lifting, whereas calling `cohere` for each pair is `:math:'O(N^2)'`. However, because of the caching, it is also more memory intensive, making 2 additional complex arrays with approximately the same number of elements as `*X*`.**

**See `:file:'test/cohere_pairs_test.py'` in the src tree for an example script that shows that this `:func:'cohere_pairs'` and `:func:'cohere'` give the same results for a given pair.**

**See also:**

`psd()` For information about the methods used to compute  $P_{xy}$ ,  $P_{xx}$  and  $P_{yy}$ .

`matplotlib.mlab.complex_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)`

Compute the complex-valued frequency spectrum of  $x$ . Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.

**window** [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

### Returns

**spectrum** [1-D array] The values for the complex spectrum (complex valued)

**freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*

### See also:

`magnitude_spectrum()` *magnitude\_spectrum()* returns the absolute value of this function.

`angle_spectrum()` *angle\_spectrum()* returns the angle of this function.

`phase_spectrum()` *phase\_spectrum()* returns the phase (unwrapped angle) of this function.

`specgram()` *specgram()* can return the complex spectrum of segments within the signal.

`matplotlib.mlab.contiguous_regions(mask)`

Deprecated since version 2.2: Moved to `matplotlib.cbook`

return a list of (ind0, ind1) such that `mask[ind0:ind1].all()` is `True` and we cover all such regions

`matplotlib.mlab.cross_from_above(x, threshold)`

Deprecated since version 2.2: The `cross_from_above` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

return the indices into *x* where *x* crosses some threshold from below, e.g., the *i*'s where:

```
x[i-1]>threshold and x[i]<=threshold
```

### See also:

`cross_from_below()`

`matplotlib.mlab.cross_from_below(x, threshold)`

Deprecated since version 2.2: The `cross_from_below` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

return the indices into *x* where *x* crosses some threshold from below, e.g., the *i*'s where:

```
x[i-1]<threshold and x[i]>=threshold
```

Example code:

```
import matplotlib.pyplot as plt

t = np.arange(0.0, 2.0, 0.1)
s = np.sin(2*np.pi*t)

fig, ax = plt.subplots()
ax.plot(t, s, '-o')
ax.axhline(0.5)
```

(continues on next page)

(continued from previous page)

```
ax.axhline(-0.5)

ind = cross_from_below(s, 0.5)
ax.vlines(t[ind], -1, 1)

ind = cross_from_above(s, -0.5)
ax.vlines(t[ind], -1, 1)

plt.show()
```

**See also:***cross\_from\_above()*

`matplotlib.mlab.csd(x, y, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None)`

Compute the cross-spectral density.

Call signature:

```
csd(x, y, NFFT=256, Fs=2, detrend=mlab.detrend_none,
    window=mlab.window_hanning, noverlap=0, pad_to=None,
    sides='default', scale_by_freq=None)
```

The cross spectral density  $P_{xy}$  by Welch's average periodogram method. The vectors  $x$  and  $y$  are divided into  $NFFT$  length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of  $x$  and  $y$  are averaged over each segment to compute  $P_{xy}$ , with a scaling to correct for power loss due to windowing.

If  $\text{len}(x) < NFFT$  or  $\text{len}(y) < NFFT$ , they will be zero padded to  $NFFT$ .

**Parameters**

- x, y** [1-D arrays or sequences] Arrays or sequences containing the data
- Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit. The default value is 2.
- window** [callable or ndarray] A function or a vector of length  $NFFT$ . To create window vectors see *window\_hanning()*, *window\_none()*, *numpy.blackman()*, *numpy.hamming()*, *numpy.bartlett()*, *scipy.signal()*, *scipy.signal.get\_window()*, etc. The default is *window\_hanning()*. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.
- pad\_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from  $NFFT$ , which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to  $NFFT$

**NFFT** [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad\_to* for this instead.

**detrend** [{'default', 'constant', 'mean', 'linear', 'none'} or callable] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib it is a function. The *mlab* module defines *detrend\_none()*, *detrend\_mean()*, and *detrend\_linear()*, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call *detrend\_mean()*. 'linear' calls *detrend\_linear()*. 'none' calls *detrend\_none()*.

**scale\_by\_freq** [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [integer] The number of points of overlap between segments. The default value is 0 (no overlap).

### Returns

**Pxy** [1-D array] The values for the cross spectrum  $P_{\{xy\}}$  before scaling (real valued)

**freqs** [1-D array] The frequencies corresponding to the elements in *Pxy*

### See also:

*psd()* *psd()* is the equivalent to setting  $y=x$ .

### References

Bendat & Piersol - Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

```
matplotlib.mlab.csv2rec(fname, comments='#', skiprows=0, checkrows=0, delimiter=',', converterd=None, names=None, missing="", missingd=None, use_mrecords=False, dayfirst=False, yearfirst=False)
```

Deprecated since version 2.2: The *csv2rec* function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Load data from comma/space/tab delimited file in *fname* into a numpy record array and return the record array.

If *names* is *None*, a header row is required to automatically assign the recarray names. The headers will be lower cased, spaces will be converted to underscores, and illegal attribute name characters removed. If *names* is not *None*, it is a sequence of names to use for the column names. In this case, it is assumed there is no header row.

- *fname*: can be a filename or a file handle. Support for gzipped files is automatic, if the filename ends in '.gz'
- *comments*: the character used to indicate the start of a comment in the file, or *None* to switch off the removal of comments

- *skiprows*: is the number of rows from the top to skip
- *checkrows*: is the number of rows to check to validate the column data type. When set to zero all rows are validated.
- *converterd*: if not *None*, is a dictionary mapping column number or munged column name to a converter function.
- *names*: if not *None*, is a list of header names. In this case, no header will be read from the file
- *missingd* is a dictionary mapping munged column names to field values which signify that the field does not contain actual data and should be masked, e.g., '0000-00-00' or 'unused'
- *missing*: a string whose value signals a missing field regardless of the column it appears in
- *use\_mrecords*: if True, return an `mrecords.fromrecords` record array if any of the data are missing
- *dayfirst*: default is False so that MM-DD-YY has precedence over DD-MM-YY. See <http://labix.org/python-dateutil/head-b95ce2094d189a89f80f5ae52a05b4ab7b41af47> for further information.
- *yearfirst*: default is False so that MM-DD-YY has precedence over YY-MM-DD. See <http://labix.org/python-dateutil/head-b95ce2094d189a89f80f5ae52a05b4ab7b41af47> for further information.

If no rows are found, *None* is returned

`matplotlib.mlab.csvformat_factory(format)`

Deprecated since version 2.2: The `csvformat_factory` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

`matplotlib.mlab.demean(x, axis=0)`

Return *x* minus its mean along the specified axis.

#### Parameters

**x** [array or sequence] Array or sequence containing the data Can have any dimensionality

**axis** [integer] The axis along which to take the mean. See `numpy.mean` for a description of this argument.

#### See also:

`delinear()`

`denone()` `delinear()` and `denone()` are other detrend algorithms.

`detrend_mean()` This function is the same as `detrend_mean()` except for the default *axis*.

`matplotlib.mlab.detrend(x, key=None, axis=None)`

Return *x* with its trend removed.

#### Parameters

**x** [array or sequence] Array or sequence containing the data.

**key** [[ 'default' | 'constant' | 'mean' | 'linear' | 'none' ] or function] Specifies the detrend algorithm to use. 'default' is 'mean', which is the same as `detrend_mean()`. 'constant' is the same. 'linear' is the same as `detrend_linear()`. 'none' is the same as `detrend_none()`. The default is

'mean'. See the corresponding functions for more details regarding the algorithms. Can also be a function that carries out the detrend operation.

**axis** [integer] The axis along which to do the detrending.

**See also:**

*detrend\_mean()* *detrend\_mean()* implements the 'mean' algorithm.

*detrend\_linear()* *detrend\_linear()* implements the 'linear' algorithm.

*detrend\_none()* *detrend\_none()* implements the 'none' algorithm.

`matplotlib.mlab.detrend_linear(y)`  
Return x minus best fit line; 'linear' detrending.

**Parameters**

**y** [0-D or 1-D array or sequence] Array or sequence containing the data

**axis** [integer] The axis along which to take the mean. See `numpy.mean` for a description of this argument.

**See also:**

*delinear()* This function is the same as *delinear()* except for the default *axis*.

*detrend\_mean()*

*detrend\_none()* *detrend\_mean()* and *detrend\_none()* are other detrend algorithms.

*detrend()* *detrend()* is a wrapper around all the detrend algorithms.

`matplotlib.mlab.detrend_mean(x, axis=None)`  
Return x minus the mean(x).

**Parameters**

**x** [array or sequence] Array or sequence containing the data Can have any dimensionality

**axis** [integer] The axis along which to take the mean. See `numpy.mean` for a description of this argument.

**See also:**

*demean()* This function is the same as *demean()* except for the default *axis*.

*detrend\_linear()*

*detrend\_none()* *detrend\_linear()* and *detrend\_none()* are other detrend algorithms.

*detrend()* *detrend()* is a wrapper around all the detrend algorithms.

`matplotlib.mlab.detrend_none(x, axis=None)`  
Return x: no detrending.

**Parameters**

**x** [any object] An object containing the data

**axis** [integer] This parameter is ignored. It is included for compatibility with `detrend_mean`

**See also:**

`denone()` This function is the same as `denone()` except for the default *axis*, which has no effect.

`detrend_mean()`

`detrend_linear()` `detrend_mean()` and `detrend_linear()` are other detrend algorithms.

`detrend()` `detrend()` is a wrapper around all the detrend algorithms.

`matplotlib.mlab.dist(x, y)`

Deprecated since version 2.2: `numpy.hypot`

Return the distance between two points.

`matplotlib.mlab.dist_point_to_segment(p, s0, s1)`

Deprecated since version 2.2: The `dist_point_to_segment` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Get the distance of a point to a segment.

*p, s0, s1* are xy sequences

This algorithm from [http://geomalgorithms.com/a02-\\_lines.html](http://geomalgorithms.com/a02-_lines.html)

`matplotlib.mlab.distances_along_curve(X)`

Deprecated since version 2.2: The `distances_along_curve` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Computes the distance between a set of successive points in *N* dimensions.

Where *X* is an *M* x *N* array or matrix. The distances between successive rows is computed. Distance is the standard Euclidean distance.

`matplotlib.mlab.donothing_callback(*args)`

Deprecated since version 2.2: The `donothing_callback` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

`matplotlib.mlab.entropy(y, bins)`

Deprecated since version 2.2: `scipy.stats.entropy`

Return the entropy of the data in *y* in units of nat.

$$-\sum p_i \ln(p_i) \quad (18.5)$$

where  $p_i$  is the probability of observing *y* in the  $i^{th}$  bin of *bins*. *bins* can be a number of bins or a range of bins; see `numpy.histogram()`.

Compare *S* with analytic calculation for a Gaussian:

```
x = mu + sigma * randn(200000)
Sanalytic = 0.5 * ( 1.0 + log(2*pi*sigma**2.0) )
```

`matplotlib.mlab.exp_safe(x)`

Deprecated since version 2.2: `numpy.exp`

Compute exponentials which safely underflow to zero.

Slow, but convenient to use. Note that `numpy` provides proper floating point exception handling with access to the underlying hardware.

`matplotlib.mlab.fftsurr(x, detrend=<function detrend_none>, window=<function window_none>)`

Deprecated since version 2.2: The `fftsurr` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Compute an FFT phase randomized surrogate of  $x$ .

`matplotlib.mlab.find(condition)`

Deprecated since version 2.2: The `find` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return the indices where `ravel(condition)` is true

`matplotlib.mlab.frange(xini, xfin=None, delta=None, **kw)`

Deprecated since version 2.2: `numpy.arange`

`frange([start,] stop[, step, keywords])` -> array of floats

Return a numpy ndarray containing a progression of floats. Similar to `numpy.arange()`, but defaults to a closed interval.

`frange(x0, x1)` returns `[x0, x0+1, x0+2, ..., x1]`; *start* defaults to 0, and the endpoint *is included*. This behavior is different from that of `range()` and `numpy.arange()`. This is deliberate, since `frange()` will probably be more useful for generating lists of points for function evaluation, and endpoints are often desired in this use. The usual behavior of `range()` can be obtained by setting the keyword `closed = 0`, in this case, `frange()` basically becomes `:func:numpy.arange'`.

When *step* is given, it specifies the increment (or decrement). All arguments can be floating point numbers.

`frange(x0,x1,d)` returns `[x0,x0+d,x0+2d,...,xfin]` where  $xfin \leq x1$ .

`frange()` can also be called with the keyword `npts`. This sets the number of points the list should contain (and overrides the value *step* might have been given). `numpy.arange()` doesn't offer this option.

Examples:

```
>>> frange(3)
array([ 0.,  1.,  2.,  3.])
>>> frange(3,closed=0)
array([ 0.,  1.,  2.])
>>> frange(1,6,2)
array([1, 3, 5]) or 1,3,5,7, depending on floating point vagueries
>>> frange(1,6.5,npts=5)
array([ 1.   ,  2.375,  3.75 ,  5.125,  6.5  ])
```

`matplotlib.mlab.get_formatd(r, formatd=None)`

Deprecated since version 2.2: The `get_formatd` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

build a `formatd` guaranteed to have a key for every dtype name

`matplotlib.mlab.get_sparse_matrix(M, N, frac=0.1)`

Deprecated since version 2.2: The `get_sparse_matrix` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return a  $M \times N$  sparse matrix with *frac* elements randomly filled.

`matplotlib.mlab.get_xyz_where(Z, Cond)`

Deprecated since version 2.2: The `get_xyz_where` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

$Z$  and  $Cond$  are  $M \times N$  matrices.  $Z$  are data and  $Cond$  is a boolean matrix where some condition is satisfied. Return value is  $(x, y, z)$  where  $x$  and  $y$  are the indices into  $Z$  and  $z$  are the values of  $Z$  at those indices.  $x$ ,  $y$ , and  $z$  are 1D arrays.

`matplotlib.mlab.griddata(x, y, z, xi, yi, interp='nn')`

Deprecated since version 2.2: The `griddata` function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `scipy.interpolate.griddata` instead.

Interpolates from a nonuniformly spaced grid to some other grid.

Fits a surface of the form  $z = f(x, y)$  to the data in the (usually) nonuniformly spaced vectors  $(x, y, z)$ , then interpolates this surface at the points specified by  $(xi, yi)$  to produce  $zi$ .

### Parameters

**x, y, z** [1d array\_like] Coordinates of grid points to interpolate from.

**xi, yi** [1d or 2d array\_like] Coordinates of grid points to interpolate to.

**interp** [string key from {'nn', 'linear'}] Interpolation algorithm, either 'nn' for natural neighbor, or 'linear' for linear interpolation.

### Returns

**2d float array** Array of values interpolated at  $(xi, yi)$  points. Array will be masked if any of  $(xi, yi)$  are outside the convex hull of  $(x, y)$ .

### Notes

If `interp` is 'nn' (the default), uses natural neighbor interpolation based on Delaunay triangulation. This option is only available if the `mpl_toolkits.natgrid` module is installed. This can be downloaded from <https://github.com/matplotlib/natgrid>. The  $(xi, yi)$  grid must be regular and monotonically increasing in this case.

If `interp` is 'linear', linear interpolation is used via `matplotlib.tri.LinearTriInterpolator`.

Instead of using `griddata`, more flexible functionality and other interpolation options are available using a `matplotlib.tri.Triangulation` and a `matplotlib.tri.TriInterpolator`.

`matplotlib.mlab.identity(n, rank=2, dtype='l', typecode=None)`

Deprecated since version 2.2: `numpy.identity`

Returns the identity matrix of shape  $(n, n, \dots, n)$  (rank  $r$ ).

For ranks higher than 2, this object is simply a multi-index Kronecker delta:

$$id[i_0, i_1, \dots, i_R] = \begin{cases} 1 & \text{if } i_0=i_1=\dots=i_R, \\ 0 & \text{otherwise.} \end{cases}$$

Optionally a `dtype` (or `typecode`) may be given (it defaults to 'l').

Since rank defaults to 2, this function behaves in the default case (when only  $n$  is given) like `numpy.identity(n)` - but surprisingly, it is much faster.

`matplotlib.mlab.inside_poly(points, verts)`

Deprecated since version 2.2: The `inside_poly` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

*points* is a sequence of *x, y* points. *verts* is a sequence of *x, y* vertices of a polygon.

Return value is a sequence of indices into points for the points that are inside the polygon.

`matplotlib.mlab.is_closed_polygon(X)`

Deprecated since version 2.2: The `is_closed_polygon` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Tests whether first and last object in a sequence are the same. These are presumably coordinates on a polygonal curve, in which case this function tests if that curve is closed.

`matplotlib.mlab.ispower2(n)`

Deprecated since version 2.2: The `ispower2` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Returns the log base 2 of *n* if *n* is a power of 2, zero otherwise.

Note the potential ambiguity if  $n == 1$ :  $2^{*0} == 1$ , interpret accordingly.

`matplotlib.mlab.isvector(X)`

Deprecated since version 2.2: The `isvector` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Like the MATLAB function with the same name, returns *True* if the supplied numpy array or matrix *X* looks like a vector, meaning it has a one non-singleton axis (i.e., it can have multiple axes, but all must have length 1, except for one of them).

If you just want to see if the array has 1 axis, use  $X.ndim == 1$ .

`matplotlib.mlab.l1norm(a)`

Deprecated since version 2.2: The `l1norm` function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `numpy.linalg.norm(a, ord=1)` instead.

Return the *l1* norm of *a*, flattened out.

Implemented as a separate function (not a call to `norm()` for speed).

`matplotlib.mlab.l2norm(a)`

Deprecated since version 2.2: The `l2norm` function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `numpy.linalg.norm(a, ord=2)` instead.

Return the *l2* norm of *a*, flattened out.

Implemented as a separate function (not a call to `norm()` for speed).

`matplotlib.mlab.less_simple_linear_interpolation(x, y, xi, extrap=False)`

Deprecated since version 2.2: The `less_simple_linear_interpolation` function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `numpy.interp` instead.

This function provides simple (but somewhat less so than `cbook.simple_linear_interpolation()`) linear interpolation. `simple_linear_interpolation()` will give a list of point between a start and an end, while this does true linear interpolation at an arbitrary set of points.

This is very inefficient linear interpolation meant to be used only for a small number of points in relatively non-intensive use cases. For real linear interpolation, use `scipy`.

`matplotlib.mlab.log2(x, ln2=0.6931471805599453)`

Deprecated since version 2.2: `numpy.log2`

Return the  $\log(x)$  in base 2.

This is a `_slow_` function but which is guaranteed to return the correct integer value if the input is an integer exact power of 2.

`matplotlib.mlab.logspace(xmin, xmax, N)`

Deprecated since version 2.2: The `logspace` function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `numpy.logspace` or `numpy.geomspace` instead.

Return  $N$  values logarithmically spaced between  $xmin$  and  $xmax$ .

`matplotlib.mlab.longest_contiguous_ones(x)`

Deprecated since version 2.2: The `longest_contiguous_ones` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return the indices of the longest stretch of contiguous ones in  $x$ , assuming  $x$  is a vector of zeros and ones. If there are two equally long stretches, pick the first.

`matplotlib.mlab.longest_ones(x)`

Deprecated since version 2.2: The `longest_ones` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

alias for `longest_contiguous_ones`

`matplotlib.mlab.magnitude_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)`

Compute the magnitude (absolute value) of the frequency spectrum of  $x$ . Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.

**window** [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

### Returns

**spectrum** [1-D array] The values for the magnitude spectrum (real valued)

**freqs** [1-D array] The frequencies corresponding to the elements in `spectrum`

**See also:**

`psd()` `psd()` returns the power spectral density.

`complex_spectrum()` This function returns the absolute value of `complex_spectrum()`.

`angle_spectrum()` `angle_spectrum()` returns the angles of the corresponding frequencies.

`phase_spectrum()` `phase_spectrum()` returns the phase (unwrapped angle) of the corresponding frequencies.

`specgram()` `specgram()` can return the magnitude spectrum of segments within the signal.

`matplotlib.mlab.movavg(x, n)`

Deprecated since version 2.2: The `movavg` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Compute the `len(n)` moving average of `x`.

`matplotlib.mlab.norm_flat(a, p=2)`

Deprecated since version 2.2: The `norm_flat` function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `numpy.linalg.norm(a.flat, ord=p)` instead.

`norm(a,p=2)` -> l-p norm of `a.flat`

Return the l-p norm of `a`, considered as a flat array. This is NOT a true matrix norm, since arrays of arbitrary rank are always flattened.

`p` can be a number or the string 'Infinity' to get the L-infinity norm.

`matplotlib.mlab.normpdf(x, *args)`

Deprecated since version 2.2: `scipy.stats.norm.pdf`

Return the normal pdf evaluated at `x`; `args` provides `mu`, `sigma`

`matplotlib.mlab.offset_line(y, yerr)`

Deprecated since version 2.2: The `offset_line` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Offsets an array `y` by +/- an error and returns a tuple (`y - err`, `y + err`).

The error term can be:

- A scalar. In this case, the returned tuple is obvious.
- A vector of the same length as `y`. The quantities `y +/- err` are computed component-wise.
- A tuple of length 2. In this case, `yerr[0]` is the error below `y` and `yerr[1]` is error above `y`. For example:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.linspace(0, 2*np.pi, num=100, endpoint=True)
y = np.sin(x)
y_minus, y_plus = mlab.offset_line(y, 0.1)
plt.plot(x, y)
plt.fill_between(x, y_minus, y2=y_plus)
plt.show()
```

`matplotlib.mlab.path_length(X)`

Deprecated since version 2.2: The `path_length` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Computes the distance travelled along a polygonal curve in  $N$  dimensions.

Where  $X$  is an  $M \times N$  array or matrix. Returns an array of length  $M$  consisting of the distance along the curve at each point (i.e., the rows of  $X$ ).

`matplotlib.mlab.phase_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)`

Compute the phase of the frequency spectrum (unwrapped angle spectrum) of  $x$ . Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.

**window** [callable or ndarray] A function or a vector of length  $NFFT$ . To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

### Returns

**spectrum** [1-D array] The values for the phase spectrum in radians (real valued)

**freqs** [1-D array] The frequencies corresponding to the elements in `spectrum`

### See also:

`complex_spectrum()` This function returns the angle value of `complex_spectrum()`.

`magnitude_spectrum()` `magnitude_spectrum()` returns the magnitudes of the corresponding frequencies.

`angle_spectrum()` `angle_spectrum()` returns the wrapped version of this function.

`specgram()` `specgram()` can return the phase spectrum of segments within the signal.

`matplotlib.mlab.poly_below(xmin, xs, ys)`

Deprecated since version 2.2: The `poly_below` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Given a sequence of `xs` and `ys`, return the vertices of a polygon that has a horizontal base at `xmin` and an upper bound at the `ys`. `xmin` is a scalar.

Intended for use with `matplotlib.axes.Axes.fill()`, e.g.,:

```
xv, yv = poly_below(0, x, y)
ax.fill(xv, yv)
```

`matplotlib.mlab.poly_between(x, ylower, yupper)`

Deprecated since version 2.2: The `poly_between` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Given a sequence of `x`, `ylower` and `yupper`, return the polygon that fills the regions between them. `ylower` or `yupper` can be scalar or iterable. If they are iterable, they must be equal in length to `x`.

Return value is `x`, `y` arrays for use with `matplotlib.axes.Axes.fill()`.

`matplotlib.mlab.prctile(x, p=(0.0, 25.0, 50.0, 75.0, 100.0))`

Deprecated since version 2.2: `numpy.percentile`

Return the percentiles of `x`. `p` can either be a sequence of percentile values or a scalar. If `p` is a sequence, the  $i$ th element of the return sequence is the  $p^*(i)$ -th percentile of `x`. If `p` is a scalar, the largest value of `x` less than or equal to the `p` percentage point in the sequence is returned.

`matplotlib.mlab.prctile_rank(x, p)`

Deprecated since version 2.2: The `prctile_rank` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return the rank for each element in `x`, return the rank  $0..len(p)$ . e.g., if `p = (25, 50, 75)`, the return value will be a `len(x)` array with values in `[0,1,2,3]` where 0 indicates the value is less than the 25th percentile, 1 indicates the value is  $\geq$  the 25th and  $<$  50th percentile, ... and 3 indicates the value is above the 75th percentile cutoff.

`p` is either an array of percentiles in `[0..100]` or a scalar which indicates how many quantiles of data you want ranked.

`matplotlib.mlab.psd(x, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None)`

Compute the power spectral density.

Call signature:

```
psd(x, NFFT=256, Fs=2, detrend=mlab.detrend_none,
    window=mlab.window_hanning, noverlap=0, pad_to=None,
    sides='default', scale_by_freq=None)
```

The power spectral density  $P_{xx}$  by Welch's average periodogram method. The vector `x` is divided into `NFFT` length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The  $|fft(i)|^2$  of each segment  $i$  are averaged to compute  $P_{xx}$ .

If `len(x) < NFFT`, it will be zero padded to `NFFT`.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.

**window** [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from `NFFT`, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to `NFFT`.

**NFFT** [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use `pad_to` for this instead.

**detrend** [{'default', 'constant', 'mean', 'linear', 'none'} or callable] The function applied to each segment before `fft`-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the `detrend` parameter is a vector, in matplotlib it is a function. The `mlab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

**scale\_by\_freq** [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is `True` for MATLAB compatibility.

**noverlap** [integer] The number of points of overlap between segments. The default value is 0 (no overlap).

### Returns

**Pxx** [1-D array] The values for the power spectrum  $P_{\{xx\}}$  (real valued)

**freqs** [1-D array] The frequencies corresponding to the elements in `Pxx`

### See also:

`specgram()` `specgram()` differs in the default overlap; in not returning the mean of the segment periodograms; and in returning the times of the segments.

`magnitude_spectrum()` `magnitude_spectrum()` returns the magnitude spectrum.

`csd()` `csd()` returns the spectral density between two signals.

## References

Bendat & Piersol - Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

`matplotlib.mlab.quad2cubic(q0x, q0y, q1x, q1y, q2x, q2y)`

Deprecated since version 2.2: The `quad2cubic` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Converts a quadratic Bezier curve to a cubic approximation.

The inputs are the x and y coordinates of the three control points of a quadratic curve, and the output is a tuple of x and y coordinates of the four control points of the cubic curve.

`matplotlib.mlab.rec2csv(r, fname, delimiter=',', formatd=None, missing="", missingd=None, withheader=True)`

Deprecated since version 2.2: The `rec2csv` function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `numpy.recarray.tofile` instead.

Save the data from numpy recarray `r` into a comma-/space-/tab-delimited file. The record array dtype names will be used for column headers.

***fname***: can be a filename or a file handle. Support for gzipped files is automatic, if the filename ends in `'.gz'`

***withheader***: if `withheader` is `False`, do not write the attribute names in the first row

for `formatd` type `FormatFloat`, we override the precision to store full precision floats in the CSV file

### See also:

`csv2rec()` For information about `missing` and `missingd`, which can be used to fill in masked values into your CSV file.

`matplotlib.mlab.rec2txt(r, header=None, padding=3, precision=3, fields=None)`

Deprecated since version 2.2: The `rec2txt` function was deprecated in Matplotlib 2.2 and will be removed in 3.1. Use `numpy.recarray.tofile` instead.

Returns a textual representation of a record array.

### Parameters

**r**: numpy recarray

**header**: list column headers

**padding**: space between each column

**precision**: number of decimal places to use for floats. Set to an integer to apply to all floats. Set to a list of integers to apply precision individually. Precision for non-floats is simply ignored.

**fields** [list] If not `None`, a list of field names to print. `fields` can be a list of strings like `['field1', 'field2']` or a single comma separated string like `'field1,field2'`

## Examples

For `precision=[0,2,3]`, the output is

ID	Price	Return
ABC	12.54	0.234
XYZ	6.32	-0.076

`matplotlib.mlab.rec_append_fields(rec, names, arrs, dtypes=None)`

Deprecated since version 2.2: The `rec_append_fields` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return a new record array with field names populated with data from arrays in *arrs*. If appending a single field, then *names*, *arrs* and *dtypes* do not have to be lists. They can just be the values themselves.

`matplotlib.mlab.rec_drop_fields(rec, names)`

Deprecated since version 2.2: The `rec_drop_fields` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return a new numpy record array with fields in *names* dropped.

`matplotlib.mlab.rec_groupby(r, groupby, stats)`

Deprecated since version 2.2: The `rec_groupby` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

*r* is a numpy record array

*groupby* is a sequence of record array attribute names that together form the grouping key. e.g., ('date', 'productcode')

*stats* is a sequence of (*attr*, *func*, *outname*) tuples which will call `x = func(attr)` and assign *x* to the record array output with attribute *outname*. For example:

```
stats = ( ('sales', len, 'numsales'), ('sales', np.mean, 'avgsale') )
```

Return record array has *dtype* names for each attribute name in the *groupby* argument, with the associated group values, and for each *outname* name in the *stats* argument, with the associated stat summary output.

`matplotlib.mlab.rec_join(key, r1, r2, jointype='inner', defaults=None, r1postfix='1', r2postfix='2')`

Deprecated since version 2.2: The `rec_join` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Join record arrays *r1* and *r2* on *key*; *key* is a tuple of field names - if *key* is a string it is assumed to be a single attribute name. If *r1* and *r2* have equal values on all the keys in the *key* tuple, then their fields will be merged into a new record array containing the intersection of the fields of *r1* and *r2*.

*r1* (also *r2*) must not have any duplicate keys.

The *jointype* keyword can be 'inner', 'outer', 'leftouter'. To do a rightouter join just reverse *r1* and *r2*.

The *defaults* keyword is a dictionary filled with {*column\_name*:*default\_value*} pairs.

The keywords *r1postfix* and *r2postfix* are postfixed to column names (other than keys) that are both in *r1* and *r2*.

`matplotlib.mlab.rec_keep_fields(rec, names)`

Deprecated since version 2.2: The `rec_keep_fields` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return a new numpy record array with only fields listed in `names`

`matplotlib.mlab.rec_summarize(r, summaryfuncs)`

Deprecated since version 2.2: The `rec_summarize` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

`r` is a numpy record array

`summaryfuncs` is a list of `(attr, func, outname)` tuples which will apply `func` to the array `r[attr]` and assign the output to a new attribute name `*outname`. The returned record array is identical to `r`, with extra arrays for each element in `summaryfuncs`.

`matplotlib.mlab.recs_join(key, name, recs, jointype='outer', missing=0.0, postfixes=None)`

Deprecated since version 2.2: The `recs_join` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Join a sequence of record arrays on single column key.

This function only joins a single column of the multiple record arrays

**key** is the column name that acts as a key

**name** is the name of the column that we want to join

**recs** is a list of record arrays to join

**jointype** is a string 'inner' or 'outer'

**missing** is what any missing field is replaced by

**postfixes** if not None, a len recs sequence of postfixes

returns a record array with columns [rowkey, name0, name1, ... namen-1]. or if postfixes [PF0, PF1, ..., PFN-1] are supplied, [rowkey, namePF0, namePF1, ... namePFN-1].

Example:

```
r = recs_join("date", "close", recs=[r0, r1], missing=0.)
```

`matplotlib.mlab.rk4(derivs, y0, t)`

Deprecated since version 2.2: `scipy.integrate.ode`

Integrate 1D or ND system of ODEs using 4-th order Runge-Kutta. This is a toy implementation which may be useful if you find yourself stranded on a system w/o `scipy`. Otherwise use `scipy.integrate()`.

#### Parameters

**y0** initial state vector

**t** sample times

**derivs** returns the derivative of the system and has the signature `dy = derivs(yi, ti)`

#### Examples

A 2D system:

```
def derivs6(x,t):
    d1 = x[0] + 2*x[1]
    d2 = -3*x[0] + 4*x[1]
    return (d1, d2)
dt = 0.0005
t = arange(0.0, 2.0, dt)
y0 = (1,2)
yout = rk4(derivs6, y0, t)
```

A 1D system:

```
alpha = 2
def derivs(x,t):
    return -alpha*x + exp(-t)

y0 = 1
yout = rk4(derivs, y0, t)
```

If you have access to `scipy`, you should probably be using the `scipy.integrate` tools rather than this function.

`matplotlib.mlab.rms_flat(a)`

Deprecated since version 2.2: The `rms_flat` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return the root mean square of all the elements of  $a$ , flattened out.

`matplotlib.mlab.safe_isinf(x)`

Deprecated since version 2.2: `numpy.isinf`

`numpy.isinf()` for arbitrary types

`matplotlib.mlab.safe_isnan(x)`

Deprecated since version 2.2: `numpy.isnan`

`numpy.isnan()` for arbitrary types

`matplotlib.mlab.segments_intersect(s1, s2)`

Deprecated since version 2.2: The `segments_intersect` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Return *True* if  $s1$  and  $s2$  intersect.  $s1$  and  $s2$  are defined as:

```
s1: (x1, y1), (x2, y2)
s2: (x3, y3), (x4, y4)
```

`matplotlib.mlab.slopes(x, y)`

Deprecated since version 2.2: The `slopes` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

`slopes()` calculates the slope  $y'(x)$

The slope is estimated using the slope obtained from that of a parabola through any three consecutive points.

This method should be superior to that described in the appendix of A CONSISTENTLY WELL BEHAVED METHOD OF INTERPOLATION by Russel W. Stineman (Creative Computing July 1980) in at least one aspect:

Circles for interpolation demand a known aspect ratio between x- and y-values. For many functions, however, the abscissa are given in different dimensions, so an aspect ratio is completely arbitrary.

The parabola method gives very similar results to the circle method for most regular cases but behaves much better in special cases.

Norbert Nemec, Institute of Theoretical Physics, University of Regensburg, April 2006  
Norbert.Nemec at physik.uni-regensburg.de

(inspired by a original implementation by Halldor Bjornsson, Icelandic Meteorological Office, March 2006 halldor at vedur.is)

```
matplotlib.mlab.spectrogram(x, NFFT=None, Fs=None, detrend=None, window=None,
                             noverlap=None, pad_to=None, sides=None,
                             scale_by_freq=None, mode=None)
```

Compute a spectrogram.

Compute and plot a spectrogram of data in x. Data are split into NFFT length segments and the spectrum of each section is computed. The windowing function window is applied to each segment, and the amount of overlap of each segment is specified with noverlap.

### Parameters

**x** [array\_like] 1-D array or sequence.

**Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

**window** [callable or ndarray] A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is None, which sets *pad\_to* equal to *NFFT*

**NFFT** [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad\_to* for this instead.

**detrend** [{'default', 'constant', 'mean', 'linear', 'none'} or callable] The function applied to each segment before `fft`-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib it is a function. The *mlab* module de-

finds `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

**scale\_by\_freq** [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [int, optional] The number of points of overlap between blocks. The default value is 128.

**mode** [str, optional]

**What sort of spectrum to use, default is 'psd'.**

'psd' Returns the power spectral density.

'complex' Returns the complex-valued frequency spectrum.

'magnitude' Returns the magnitude spectrum.

'angle' Returns the phase spectrum without unwrapping.

'phase' Returns the phase spectrum with unwrapping.

### Returns

**spectrum** [array\_like] 2-D array, columns are the periodograms of successive segments.

**freqs** [array\_like] 1-D array, frequencies corresponding to the rows in *spectrum*.

**t** [array\_like] 1-D array, the times corresponding to midpoints of segments (i.e the columns in *spectrum*).

### See also:

`psd` differs in the overlap and in the return values.

`complex_spectrum` similar, but with complex valued frequencies.

`magnitude_spectrum` similar single segment when mode is 'magnitude'.

`angle_spectrum` similar to single segment when mode is 'angle'.

`phase_spectrum` similar to single segment when mode is 'phase'.

### Notes

`detrend` and `scale_by_freq` only apply when *mode* is set to 'psd'.

`matplotlib.mlab.stineman_interp(xi, x, y, yp=None)`

Deprecated since version 2.2: The `stineman_interp` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Given data vectors *x* and *y*, the slope vector *yp* and a new abscissa vector *xi*, the function `stineman_interp()` uses Stineman interpolation to calculate a vector *yi* corresponding to *xi*.

Here's an example that generates a coarse sine curve, then interpolates over a finer abscissa:

```
x = linspace(0,2*pi,20); y = sin(x); yp = cos(x)
xi = linspace(0,2*pi,40);
yi = stineman_interp(xi,x,y,yp);
plot(x,y,'o',xi,yi)
```

The interpolation method is described in the article A CONSISTENTLY WELL BEHAVED METHOD OF INTERPOLATION by Russell W. Stineman. The article appeared in the July 1980 issue of Creative Computing with a note from the editor stating that while they were:

not an academic journal but once in a while something serious and original comes in adding that this was "apparently a real solution" to a well known problem.

For `yp = None`, the routine automatically determines the slopes using the `slopes()` routine.

`x` is assumed to be sorted in increasing order.

For values `xi[j] < x[0]` or `xi[j] > x[-1]`, the routine tries an extrapolation. The relevance of the data obtained from this, of course, is questionable...

Original implementation by Halldor Bjornsson, Icelandic Meteorological Office, March 2006 halldor at vedur.is

Completely reworked and optimized for Python by Norbert Nemec, Institute of Theoretical Physics, University of Regensburg, April 2006 Norbert.Nemec at physik.uni-regensburg.de

`matplotlib.mlab.stride_repeat(x, n, axis=0)`

Repeat the values in an array in a memory-efficient manner. Array `x` is stacked vertically `n` times.

**Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

### Parameters

**x** [1D array or sequence] Array or sequence containing the data.

**n** [integer] The number of time to repeat the array.

**axis** [integer] The axis along which the data will run.

### References

[stackoverflow: Repeat NumPy array without replicating data?](#)

`matplotlib.mlab.stride_windows(x, n, noverlap=None, axis=0)`

Get all windows of `x` with length `n` as a single array, using strides to avoid data duplication.

**Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

### Parameters

- x** [1D array or sequence] Array or sequence containing the data.
- n** [integer] The number of data points in each window.
- noverlap** [integer] The overlap between adjacent windows. Default is 0 (no overlap)
- axis** [integer] The axis along which the windows will run.

### References

[stackoverflow: Rolling window for 1D arrays in Numpy?](#) [stackoverflow: Using strides for an efficient moving average filter](#)

`matplotlib.mlab.vector_lengths(X, P=2.0, axis=None)`

Deprecated since version 2.2: The `vector_lengths` function was deprecated in Matplotlib 2.2 and will be removed in 3.1.

Finds the length of a set of vectors in  $n$  dimensions. This is like the `numpy.norm()` function for vectors, but has the ability to work over a particular axis of the supplied array or matrix.

Computes  $(\sum(x_i^P))^{1/P}$  for each  $\{x_i\}$  being the elements of  $X$  along the given axis. If *axis* is *None*, compute over all elements of  $X$ .

`matplotlib.mlab.window_hanning(x)`

Return  $x$  times the hanning window of `len(x)`.

#### See also:

`window_none()` `window_none()` is another window algorithm.

`matplotlib.mlab.window_none(x)`

No window function; simply return  $x$ .

#### See also:

`window_hanning()` `window_hanning()` is another window algorithm.

## 18.29 offsetbox

### 18.29.1 matplotlib.offsetbox

The `OffsetBox` is a simple container artist. The child artist are meant to be drawn at a relative position to its parent. The `[VH]Packer`, `DrawingArea` and `TextArea` are derived from the `OffsetBox`.

The `[VH]Packer` automatically adjust the relative postisions of their children, which should be instances of the `OffsetBox`. This is used to align similar artists together, e.g., in legend.

The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The TextArea contains a single Text instance. The width and height of the TextArea instance is the width and height of the its child text.

```
class matplotlib.offsetbox.AnchoredOffsetbox(loc, pad=0.4, borderpad=0.5,
                                             child=None, prop=None,
                                             frameon=True, bbox_to_anchor=None,
                                             bbox_transform=None, **kwargs)
```

Bases: `matplotlib.offsetbox.OffsetBox`

An offset box placed according to the legend location *loc*. AnchoredOffsetbox has a single child. When multiple children is needed, use other OffsetBox class to enclose them. By default, the offset box is anchored against its parent axes. You may explicitly specify the *bbox\_to\_anchor*.

*loc* is a string or an integer specifying the legend location. The valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5, (same as 'center right', for back-compatibility)
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10,
```

**pad** [pad around the child for drawing a frame. given in] fraction of fontsize.

**borderpad** : pad between offsetbox frame and the *bbox\_to\_anchor*,

**child** : OffsetBox instance that will be anchored.

**prop** : font property. This is only used as a reference for paddings.

**frameon** : draw a frame box if True.

**bbox\_to\_anchor** : bbox to anchor. Use `self.axes.bbox` if None.

**bbox\_transform** : with which the *bbox\_to\_anchor* will be transformed.

`codes = {'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower left': 3, 'lower right': 4, 'upper center': 9, 'upper left': 2, 'upper right': 1, 'right': 5}`

**draw**(*renderer*)

draw the artist

**get\_bbox\_to\_anchor**()

return the bbox that the legend will be anchored

**get\_child**()

return the child

**get\_children**()

return the list of children

**get\_extent**(*renderer*)

return the extent of the artist. The extent of the child added with the pad is returned

**get\_window\_extent**(*renderer*)

get the bounding box in display space.

`set_bbox_to_anchor(bbox, transform=None)`  
 set the bbox that the child will be anchored.

*bbox* can be a Bbox instance, a list of [left, bottom, width, height], or a list of [left, bottom] where the width and height will be assumed to be zero. The bbox will be transformed to display coordinate by the given transform.

`set_child(child)`  
 set the child to be anchored

`update_frame(bbox, fontsize=None)`

`zorder = 5`

```
class matplotlib.offsetbox.AnchoredText(s, loc, pad=0.4, borderpad=0.5, prop=None,
                                       **kwargs)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

AnchoredOffsetbox with Text.

### Parameters

**s** [string] Text.

**loc** [str] Location code.

**pad** [float, optional] Pad between the text and the frame as fraction of the font size.

**borderpad** [float, optional] Pad between the frame and the axes (or *bbox\_to\_anchor*).

**prop** [`matplotlib.font_manager.FontProperties`] Font properties.

### Notes

Other keyword parameters of `AnchoredOffsetbox` are also allowed.

```
class matplotlib.offsetbox.AnnotationBbox(offsetbox, xy, xybox=None, xy-
                                         coords='data', boxcoords=None,
                                         frameon=True, pad=0.4, annota-
                                         tion_clip=None, box_alignment=(0.5, 0.5),
                                         bboxprops=None, arrowprops=None, font-
                                         size=None, **kwargs)
```

Bases: `matplotlib.artist.Artist`, `matplotlib.text._AnnotationBase`

Annotation-like class, but with offsetbox instead of Text.

*offsetbox* : OffsetBox instance

**xycoords** [same as Annotation but can be a tuple of two] strings which are interpreted as x and y coordinates.

**boxcoords** [similar to textcoords as Annotation but can be a] tuple of two strings which are interpreted as x and y coordinates.

**box\_alignment** [a tuple of two floats for a vertical and] horizontal alignment of the offset box w.r.t. the *boxcoords*. The lower-left corner is (0.0) and upper-right corner is (1.1).

other parameters are identical to that of Annotation.

`anncoords`

`contains(event)`

Test whether the artist contains the mouse event.

Returns the truth value and a dictionary of artist specific details of selection, such as which points are contained in the pick radius. See individual artists for details.

`draw(renderer)`

Draw the Annotation object to the given *renderer*.

`get_children()`

Return a list of the child Artist's this :class:`Artist` contains.

`get_fontsize(s=None)`

return fontsize in points

`set_figure(fig)`

Set the *Figure* instance the artist belongs to.

### Parameters

**fig** [*Figure*]

`set_fontsize(s=None)`

set fontsize in points

`update_positions(renderer)`

Update the pixel positions of the annotated point and the text.

`xyann`

`zorder = 3`

`class matplotlib.offsetbox.AuxTransformBox(aux_transform)`

Bases: `matplotlib.offsetbox.OffsetBox`

Offset Box with the `aux_transform`. Its children will be transformed with the `aux_transform` first then will be offsetted. The absolute coordinate of the `aux_transform` is meaning as it will be automatically adjust so that the left-lower corner of the bounding box of children will be set to (0,0) before the offset transform.

It is similar to drawing area, except that the extent of the box is not predetermined but calculated from the window extent of its children. Furthermore, the extent of the children will be calculated in the transformed coordinate.

`add_artist(a)`

Add any *Artist* to the container box

`draw(renderer)`

Draw the children

`get_extent(renderer)`

Return with, height, xdescent, ydescent of box

`get_offset()`

return offset of the container.

`get_transform()`

Return the *Transform* applied to the children

`get_window_extent(renderer)`

get the bounding box in display space.

`set_offset(xy)`

set offset of the container.

Accept : tuple of x,y coordinate in display units.

```
set_transform(t)
    set_transform is ignored.
```

```
class matplotlib.offsetbox.DraggableAnnotation(annotation, use_blit=False)
    Bases: matplotlib.offsetbox.DraggableBase
```

```
save_offset()
update_offset(dx, dy)
```

```
class matplotlib.offsetbox.DraggableBase(ref_artist, use_blit=False)
    Bases: object
```

helper code for a draggable artist (legend, offsetbox) The derived class must override following two method.

```
def save_offset(self): pass
def update_offset(self, dx, dy): pass
```

*save\_offset* is called when the object is picked for dragging and it is meant to save reference position of the artist.

***update\_offset* is called during the dragging. dx and dy is the pixel offset** from the point where the mouse drag started.

Optionally you may override following two methods.

```
def artist_picker(self, artist, evt): return self.ref_artist.contains(evt)
def finalize_offset(self): pass
```

***artist\_picker* is a picker method that will be used.** *finalize\_offset* is called when the mouse is released. In current implementation of *DraggableLegend* and *DraggableAnnotation*, *update\_offset* places the artists simply in display coordinates. And *finalize\_offset* recalculate their position in the normalized axes coordinate and set a relevant attribute.

```
artist_picker(artist, evt)
disconnect()
    disconnect the callbacks
finalize_offset()
on_motion(evt)
on_motion_blit(evt)
on_pick(evt)
on_release(event)
save_offset()
update_offset(dx, dy)
```

```
class matplotlib.offsetbox.DraggableOffsetBox(ref_artist, offsetbox, use_blit=False)
    Bases: matplotlib.offsetbox.DraggableBase
```

```
get_loc_in_canvas()
save_offset()
```

`update_offset(dx, dy)`

`class matplotlib.offsetbox.DrawingArea(width, height, xdescent=0.0, ydescent=0.0, clip=False)`

Bases: `matplotlib.offsetbox.OffsetBox`

The `DrawingArea` can contain any `Artist` as a child. The `DrawingArea` has a fixed width and height. The position of children relative to the parent is fixed. The children can be clipped at the boundaries of the parent.

`width, height` : width and height of the container box. `xdescent, ydescent` : descent of the box in x- and y-direction. `clip` : Whether to clip the children

`add_artist(a)`

Add any `Artist` to the container box

`clip_children`

If the children of this `DrawingArea` should be clipped by `DrawingArea` bounding box.

`draw(renderer)`

Draw the children

`get_extent(renderer)`

Return with, height, xdescent, ydescent of box

`get_offset()`

return offset of the container.

`get_transform()`

Return the `Transform` applied to the children

`get_window_extent(renderer)`

get the bounding box in display space.

`set_offset(xy)`

set offset of the container.

Accept : tuple of x,y coordinate in display units.

`set_transform(t)`

set\_transform is ignored.

`class matplotlib.offsetbox.HPacker(pad=None, sep=None, width=None, height=None, align='baseline', mode='fixed', children=None)`

Bases: `matplotlib.offsetbox.PackerBase`

The `HPacker` has its children packed horizontally. It automatically adjusts the relative positions of children at draw time.

### Parameters

**pad** [float, optional] Boundary pad.

**sep** [float, optional] Spacing between items.

**width** [float, optional]

**height** [float, optional] Width and height of the container box, calculated if `None`.

**align** [str] Alignment of boxes.

**mode** [str] Packing mode.

## Notes

*pad* and *sep* need to be given in points and will be scaled with the renderer dpi, while *width* and *height* need to be in pixels.

`get_extent_offsets(renderer)`  
update offset of children and return the extents of the box

```
class matplotlib.offsetbox.OffsetBox(*args, **kwargs)
    Bases: matplotlib.artist.Artist
```

The `OffsetBox` is a simple container artist. The child artists are meant to be drawn at a relative position to its parent.

`axes`  
The *Axes* instance the artist resides in, or *None*.

`contains(mouseevent)`  
Test whether the artist contains the mouse event.

Returns the truth value and a dictionary of artist specific details of selection, such as which points are contained in the pick radius. See individual artists for details.

`draw(renderer)`  
Update the location of children if necessary and draw them to the given *renderer*.

`get_children()`  
Return a list of artists it contains.

`get_extent(renderer)`  
Return width, height, xdescent, ydescent of box

`get_extent_offsets(renderer)`

`get_offset(width, height, xdescent, ydescent, renderer)`  
Get the offset

accepts extent of the box

`get_visible_children()`  
Return a list of visible artists it contains.

`get_window_extent(renderer)`  
get the bounding box in display space.

`set_figure(fig)`  
Set the figure  
accepts a class:*Figure* instance

`set_height(height)`  
Set the height  
accepts float

`set_offset(xy)`  
Set the offset  
accepts x, y, tuple, or a callable object.

`set_width(width)`  
Set the width  
accepts float

```
class matplotlib.offsetbox.OffsetImage(arr, zoom=1, cmap=None, norm=None, interpolation=None, origin=None, filternorm=1, filterrad=4.0, resample=False, dpi_cor=True, **kwargs)
```

Bases: *matplotlib.offsetbox.OffsetBox*

`draw(renderer)`

Draw the children

`get_children()`

Return a list of artists it contains.

`get_data()`

`get_extent(renderer)`

Return with, height, xdescent, ydescent of box

`get_offset()`

return offset of the container.

`get_window_extent(renderer)`

get the bounding box in display space.

`get_zoom()`

`set_data(arr)`

`set_zoom(zoom)`

```
class matplotlib.offsetbox.PackerBase(pad=None, sep=None, width=None, height=None, align=None, mode=None, children=None)
```

Bases: *matplotlib.offsetbox.OffsetBox*

### Parameters

**pad** [float, optional] Boundary pad.

**sep** [float, optional] Spacing between items.

**width** [float, optional]

**height** [float, optional] Width and height of the container box, calculated if *None*.

**align** [str, optional] Alignment of boxes. Can be one of top, bottom, left, right, center and baseline

**mode** [str, optional] Packing mode.

### Notes

*pad* and *sep* need to given in points and will be scale with the renderer dpi, while *width* and *height* need to be in pixels.

```
class matplotlib.offsetbox.PaddedBox(child, pad=None, draw_frame=False, patch_attrs=None)
```

Bases: *matplotlib.offsetbox.OffsetBox*

*pad* : boundary pad

---

**Note:** *pad* need to given in points and will be scale with the renderer dpi, while *width* and *height* need to be in pixels.

---

`draw(renderer)`

Update the location of children if necessary and draw them to the given *renderer*.

`draw_frame(renderer)`

`get_extent_offsets(renderer)`

update offset of childrens and return the extents of the box

`update_frame(bbox, fontsize=None)`

`class matplotlib.offsetbox.TextArea(s, textprops=None, multilinebaseline=None, minimumdescent=True)`

Bases: `matplotlib.offsetbox.OffsetBox`

The `TextArea` is contains a single `Text` instance. The text is placed at (0,0) with baseline+left alignment. The width and height of the `TextArea` instance is the width and height of the its child text.

### Parameters

**s** [str] a string to be displayed.

**textprops** [`FontProperties`, optional]

**multilinebaseline** [bool, optional] If `True`, baseline for multiline text is adjusted so that it is (approximately) center-aligned with singleline text.

**minimumdescent** [bool, optional] If `True`, the box has a minimum descent of "p".

`draw(renderer)`

Draw the children

`get_extent(renderer)`

Return with, height, xdescent, ydescent of box

`get_minimumdescent()`

get minimumdescent.

`get_multilinebaseline()`

get multilinebaseline .

`get_offset()`

return offset of the container.

`get_text()`

Returns the string representation of this area's text

`get_window_extent(renderer)`

get the bounding box in display space.

`set_minimumdescent(t)`

Set minimumdescent .

If `True`, extent of the single line text is adjusted so that it has minimum descent of "p"

`set_multilinebaseline(t)`  
Set multilinebaseline .

If True, baseline for multiline text is adjusted so that it is (approximately) center-aligned with singleline text.

`set_offset(xy)`  
set offset of the container.

Accept : tuple of x,y coordinates in display units.

`set_text(s)`  
Set the text of this area as a string.

`set_transform(t)`  
set\_transform is ignored.

`class matplotlib.offsetbox.VPacker(pad=None, sep=None, width=None, height=None, align='baseline', mode='fixed', children=None)`

Bases: `matplotlib.offsetbox.PackerBase`

The VPacker has its children packed vertically. It automatically adjust the relative positions of children in the drawing time.

### Parameters

**pad** [float, optional] Boundary pad.

**sep** [float, optional] Spacing between items.

**width** [float, optional]

**height** [float, optional] width and height of the container box, calculated if None.

**align** [str, optional] Alignment of boxes.

**mode** [str, optional] Packing mode.

### Notes

*pad* and *sep* need to given in points and will be scale with the renderer dpi, while *width* and *height* need to be in pixels.

`get_extent_offsets(renderer)`  
update offset of childrens and return the extents of the box

`matplotlib.offsetbox.bbox_artist(*args, **kwargs)`

## 18.30 patches

### 18.30.1 matplotlib.patches

#### Classes

<code>Arc(xy, width, height[, angle, theta1, theta2])</code>	An elliptical arc.
<code>Arrow(x, y, dx, dy[, width])</code>	An arrow patch.
<code>ArrowStyle</code>	<code>ArrowStyle</code> is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path.
<code>BoxStyle</code>	<code>BoxStyle</code> is a container class which defines several boxstyle classes, which are used for <code>FancyBboxPatch</code> .
<code>Circle(xy[, radius])</code>	A circle patch.
<code>CirclePolygon(xy[, radius, resolution])</code>	A polygon-approximation of a circle patch.
<code>ConnectionPatch(xyA, xyB, coordsA[, ...])</code>	A <code>ConnectionPatch</code> class is to make connecting lines between two points (possibly in different axes).
<code>ConnectionStyle</code>	<code>ConnectionStyle</code> is a container class which defines several connectionstyle classes, which is used to create a path between two points.
<code>Ellipse(xy, width, height[, angle])</code>	A scale-free ellipse.
<code>FancyArrow(x, y, dx, dy[, width, ...])</code>	Like <code>Arrow</code> , but lets you set head width and head height independently.
<code>FancyArrowPatch([posA, posB, path, ...])</code>	A fancy arrow patch.
<code>FancyBboxPatch(xy, width, height[, ...])</code>	Draw a fancy box around a rectangle with lower left at <code>xy*=(*x, y)</code> with specified width and height.
<code>Patch([edgecolor, facecolor, color, ...])</code>	A patch is a 2D artist with a face color and an edge color.
<code>PathPatch(path, **kwargs)</code>	A general polycurve path patch.
<code>Polygon(xy[, closed])</code>	A general polygon patch.
<code>Rectangle(xy, width, height[, angle])</code>	Draw a rectangle with lower left at <code>xy = (x, y)</code> with specified <i>width</i> , <i>height</i> and rotation <i>angle</i> .
<code>RegularPolygon(xy, numVertices[, radius, ...])</code>	A regular polygon patch.
<code>Shadow(patch, ox, oy[, props])</code>	Create a shadow of the given <i>patch</i> offset by <i>ox</i> , <i>oy</i> .
<code>Wedge(center, r, theta1, theta2[, width])</code>	Wedge shaped patch.
<code>YAArrow(**kwargs)</code>	Deprecated since version 3.0.

### matplotlib.patches.Arc

```
class matplotlib.patches.Arc(xy, width, height, angle=0.0, theta1=0.0, theta2=360.0,
                             **kwargs)
```

Bases: `matplotlib.patches.Ellipse`

An elliptical arc. Because it performs various optimizations, it can not be filled.

The arc must be used in an `Axes` instance—it can not be added directly to a `Figure`—because it is optimized to only render the segments that are inside the axes bounding box with high resolution.

The following args are supported:

**xy** center of ellipse

**width** length of horizontal axis

**height** length of vertical axis

**angle** rotation in degrees (anti-clockwise)

**theta1** starting angle of the arc in degrees

**theta2** ending angle of the arc in degrees

If *theta1* and *theta2* are not provided, the arc will form a complete ellipse.

Valid kwargs are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', "", (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

**draw(renderer)**

Ellipses are normally drawn using an approximation that uses eight cubic Bezier splines. The error of this approximation is 1.89818e-6, according to this unverified source:

Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

<http://www.tinaja.com/glib/ellipse4.pdf>

There is a use case where very large ellipses must be drawn with very high accuracy, and it is too expensive to render the entire ellipse with enough segments (either splines or line segments). Therefore, in the case where either radius of the ellipse is large enough that the error of the spline approximation will be visible (greater than one pixel offset from the ideal), a different technique is used.

In that case, only the visible parts of the ellipse are drawn, with each visible arc using a fixed number of spline segments (8). The algorithm proceeds as follows:

1. The points where the ellipse intersects the axes bounding box are located. (This is done by performing an inverse transformation on the axes bbox such that it is relative to the unit circle - this makes the intersection calculation much easier than doing rotated ellipse intersection directly).

This uses the "line intersecting a circle" algorithm from:

Vince, John. *Geometry for Computer Graphics: Formulae, Examples & Proofs*. London: Springer-Verlag, 2005.

2. The angles of each of the intersection points are calculated.
3. Proceeding counterclockwise starting in the positive x-direction, each of the visible arc-segments between the pairs of vertices are drawn using the Bezier arc approximation technique implemented in `matplotlib.path.Path.arc()`.

#### Examples using `matplotlib.patches.Arc`

- `sphx_glr_gallery_units_ellipse_with_units.py`

#### `matplotlib.patches.Arrow`

```
class matplotlib.patches.Arrow(x, y, dx, dy, width=1.0, **kwargs)
```

Bases: `matplotlib.patches.Patch`

An arrow patch.

Draws an arrow from (x, y) to (x + dx, y + dy). The width of the arrow is scaled by *width*.

#### Parameters

**x** [scalar] x coordinate of the arrow tail

**y** [scalar] y coordinate of the arrow tail

**dx** [scalar] Arrow length in the x direction

**dy** [scalar] Arrow length in the y direction

**width** [scalar, optional (default: 1)] Scale factor for the width of the arrow.

With a default value of 1, the tail width is 0.2 and head width is 0.6.

**\*\*kwargs** : Keyword arguments control the `Patch` properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>antialiased</code>	unknown

<i>visible</i>	bool
<i>zorder</i>	float

**See also:**

*FancyArrow* Patch that allows independent control of the head and tail properties

`get_patch_transform()`

Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path()`

Return the path of this patch

**Examples using `matplotlib.patches.Arrow`**

- sphx\_glr\_gallery\_shapes\_and\_collections\_arrow\_guide.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_artist\_reference.py

**matplotlib.patches.ArrowStyle**

```
class matplotlib.patches.ArrowStyle
    Bases: matplotlib.patches._Style
```

*ArrowStyle* is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path. These are mainly used with *FancyArrowPatch*.

A arrowstyle object can be either created as:

```
ArrowStyle.Fancy(head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4")
```

The following classes are defined

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	-[	widthB=1.0, lengthB=0.2, angleB=None
Curve-FilledB	- >	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
Curve-FilledA	< -	head_length=0.4, head_width=0.2
Curve-FilledAB	< - >	head_length=0.4, head_width=0.2
BracketA	] -	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	] - [	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	simple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	-	widthA=1.0, angleA=None, widthB=1.0, angleB=None

An instance of any arrow style class is a callable object, whose call signature is:

```
__call__(self, path, mutation_size, linewidth, aspect_ratio=1.)
```

and it returns a tuple of a *Path* instance and a boolean value. *path* is a *Path* instance along which the arrow will be drawn. *mutation\_size* and *aspect\_ratio* have the same meaning as in *BoxStyle*. *linewidth* is a line width to be stroked. This is meant to be used to correct the location of the head so that it does not overshoot the destination point, but not all classes support it.

return the instance of the subclass with the given style name.

```
class BarAB(widthA=1.0, angleA=None, widthB=1.0, angleB=None)
    Bases: matplotlib.patches._Bracket
```

An arrow with a bar() at both ends.

#### Parameters

**widthA** [float, optional, default] Width of the bracket

**angleA** [float, optional, default] Angle between the bracket and the line

**widthB** [float, optional, default] Width of the bracket

**angleB** [float, optional, default] Angle between the bracket and the line

```
class BracketA(widthA=1.0, lengthA=0.2, angleA=None)
```

```
Bases: matplotlib.patches._Bracket
```

An arrow with a bracket() at its end.

#### Parameters

**widthA** [float, optional, default] Width of the bracket

**lengthA** [float, optional, default] Length of the bracket

**angleA** [float, optional, default] Angle between the bracket and the line

```
class BracketAB(widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None)
```

```
Bases: matplotlib.patches._Bracket
```

An arrow with a bracket() at both ends.

#### Parameters

**widthA** [float, optional, default] Width of the bracket

**lengthA** [float, optional, default] Length of the bracket

**angleA** [float, optional, default] Angle between the bracket and the line

**widthB** [float, optional, default] Width of the bracket

**lengthB** [float, optional, default] Length of the bracket

**angleB** [float, optional, default] Angle between the bracket and the line

```
class BracketB(widthB=1.0, lengthB=0.2, angleB=None)
```

```
Bases: matplotlib.patches._Bracket
```

An arrow with a bracket() at its end.

#### Parameters

**widthB** [float, optional, default] Width of the bracket

**lengthB** [float, optional, default] Length of the bracket

**angleB** [float, optional, default] Angle between the bracket and the line

```
class Curve
```

```
Bases: matplotlib.patches._Curve
```

A simple curve without any arrow head.

```
class CurveA(head_length=0.4, head_width=0.2)
```

```
    Bases: matplotlib.patches._Curve
```

An arrow with a head at its begin point.

#### Parameters

**head\_length** [float, optional, default] Length of the arrow head

**head\_width** [float, optional, default] Width of the arrow head

```
class CurveAB(head_length=0.4, head_width=0.2)
```

```
    Bases: matplotlib.patches._Curve
```

An arrow with heads both at the begin and the end point.

#### Parameters

**head\_length** [float, optional, default] Length of the arrow head

**head\_width** [float, optional, default] Width of the arrow head

```
class CurveB(head_length=0.4, head_width=0.2)
```

```
    Bases: matplotlib.patches._Curve
```

An arrow with a head at its end point.

#### Parameters

**head\_length** [float, optional, default] Length of the arrow head

**head\_width** [float, optional, default] Width of the arrow head

```
class CurveFilledA(head_length=0.4, head_width=0.2)
```

```
    Bases: matplotlib.patches._Curve
```

An arrow with filled triangle head at the begin.

#### Parameters

**head\_length** [float, optional, default] Length of the arrow head

**head\_width** [float, optional, default] Width of the arrow head

```
class CurveFilledAB(head_length=0.4, head_width=0.2)
```

```
    Bases: matplotlib.patches._Curve
```

An arrow with filled triangle heads at both ends.

#### Parameters

**head\_length** [float, optional, default] Length of the arrow head

**head\_width** [float, optional, default] Width of the arrow head

```
class CurveFilledB(head_length=0.4, head_width=0.2)
```

```
    Bases: matplotlib.patches._Curve
```

An arrow with filled triangle head at the end.

#### Parameters

**head\_length** [float, optional, default] Length of the arrow head

**head\_width** [float, optional, default] Width of the arrow head

```
class Fancy(head_length=0.4, head_width=0.4, tail_width=0.4)
    Bases: matplotlib.patches._Base
```

A fancy arrow. Only works with a quadratic Bezier curve.

#### Parameters

**head\_length** [float, optional, default] Length of the arrow head

**head\_width** [float, optional, default] Width of the arrow head

**tail\_width** [float, optional, default] Width of the arrow tail

```
transmute(path, mutation_size, linewidth)
```

The `transmute` method is the very core of the `ArrowStyle` class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the `mutation_size`, with which the arrow head etc. will be scaled. The `linewidth` may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a `Path` instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

```
class Simple(head_length=0.5, head_width=0.5, tail_width=0.2)
    Bases: matplotlib.patches._Base
```

A simple arrow. Only works with a quadratic Bezier curve.

#### Parameters

**head\_length** [float, optional, default] Length of the arrow head

**head\_width** [float, optional, default] Width of the arrow head

**tail\_width** [float, optional, default] Width of the arrow tail

```
transmute(path, mutation_size, linewidth)
```

The `transmute` method is the very core of the `ArrowStyle` class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the `mutation_size`, with which the arrow head etc. will be scaled. The `linewidth` may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a `Path` instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

```
class Wedge(tail_width=0.3, shrink_factor=0.5)
    Bases: matplotlib.patches._Base
```

Wedge(?) shape. Only works with a quadratic Bezier curve. The begin point has a width of the `tail_width` and the end point has a width of 0. At the middle, the width is `shrink_factor*tail_width`.

#### Parameters

**tail\_width** [float, optional, default] Width of the tail

**shrink\_factor** [float, optional, default] Fraction of the arrow width at the middle point

```
transmute(path, mutation_size, linewidth)
```

The `transmute` method is the very core of the `ArrowStyle` class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the `mutation_size`, with which the arrow head etc. will be scaled. The `linewidth` may be used to adjust the path so that it does not pass

beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

#### Examples using `matplotlib.patches.ArrowStyle`

- `sphx_glr_gallery_pyplots_whats_new_98_4_fancy.py`

#### `matplotlib.patches.BoxStyle`

```
class matplotlib.patches.BoxStyle
    Bases: matplotlib.patches._Style
```

*BoxStyle* is a container class which defines several boxstyle classes, which are used for *FancyBboxPatch*.

A style object can be created as:

```
BoxStyle.Round(pad=0.2)
```

or:

```
BoxStyle("Round", pad=0.2)
```

or:

```
BoxStyle("Round, pad=0.2")
```

Following boxstyle classes are defined.

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

An instance of any boxstyle class is an callable object, whose call signature is:

```
__call__(self, x0, y0, width, height, mutation_size, aspect_ratio=1.)
```

and returns a Path instance. *x0*, *y0*, *width* and *height* specify the location and size of the box to be drawn. *mutation\_scale* determines the overall size of the mutation (by which I mean the transformation of the rectangle to the fancy box). *mutation\_aspect* determines the aspect-ratio of the mutation.

return the instance of the subclass with the given style name.

```
class Circle(pad=0.3)
    Bases: matplotlib.patches._Base
```

A simple circle box.

### Parameters

**pad** [float] The amount of padding around the original box.

```
transmute(x0, y0, width, height, mutation_size)
```

The `transmute` method is a very core of the `BboxTransmuter` class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the `mutation_size`, with which the amount of padding and etc. will be scaled. It returns a *Path* instance.

```
class DArrow(pad=0.3)
    Bases: matplotlib.patches._Base
```

(Double) Arrow Box

```
transmute(x0, y0, width, height, mutation_size)
```

The `transmute` method is a very core of the `BboxTransmuter` class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the `mutation_size`, with which the amount of padding and etc. will be scaled. It returns a *Path* instance.

```
class LArrow(pad=0.3)
    Bases: matplotlib.patches._Base
```

(left) Arrow Box

```
transmute(x0, y0, width, height, mutation_size)
```

The `transmute` method is a very core of the `BboxTransmuter` class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the `mutation_size`, with which the amount of padding and etc. will be scaled. It returns a *Path* instance.

```
class RArrow(pad=0.3)
    Bases: matplotlib.patches.LArrow
```

(right) Arrow Box

```
transmute(x0, y0, width, height, mutation_size)
```

The `transmute` method is a very core of the `BboxTransmuter` class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the `mutation_size`, with which the amount of padding and etc. will be scaled. It returns a *Path* instance.

```
class Round(pad=0.3, rounding_size=None)
    Bases: matplotlib.patches._Base
```

A box with round corners.

**pad** amount of padding

**rounding\_size** rounding radius of corners. *pad* if None

```
transmute(x0, y0, width, height, mutation_size)
```

The `transmute` method is a very core of the `BboxTransmuter` class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the `mutation_size`, with which the amount of padding and etc. will be scaled. It returns a *Path* instance.

```
class Round4(pad=0.3, rounding_size=None)
    Bases: matplotlib.patches._Base
    Another box with round edges.
    pad amount of padding
    rounding_size rounding size of edges. pad if None
    transmute(x0, y0, width, height, mutation_size)
        The transmute method is a very core of the BboxTransmuter class and must be
        overridden in the subclasses. It receives the location and size of the rectan-
        gle, and the mutation_size, with which the amount of padding and etc. will be
        scaled. It returns a Path instance.
```

```
class Roundtooth(pad=0.3, tooth_size=None)
    Bases: matplotlib.patches.Sawtooth
    A rounded tooth box.
    pad amount of padding
    tooth_size size of the sawtooth. pad* if None
    transmute(x0, y0, width, height, mutation_size)
        The transmute method is a very core of the BboxTransmuter class and must be
        overridden in the subclasses. It receives the location and size of the rectan-
        gle, and the mutation_size, with which the amount of padding and etc. will be
        scaled. It returns a Path instance.
```

```
class Sawtooth(pad=0.3, tooth_size=None)
    Bases: matplotlib.patches._Base
    A sawtooth box.
    pad amount of padding
    tooth_size size of the sawtooth. pad* if None
    transmute(x0, y0, width, height, mutation_size)
        The transmute method is a very core of the BboxTransmuter class and must be
        overridden in the subclasses. It receives the location and size of the rectan-
        gle, and the mutation_size, with which the amount of padding and etc. will be
        scaled. It returns a Path instance.
```

```
class Square(pad=0.3)
    Bases: matplotlib.patches._Base
    A simple square box.
    pad amount of padding
    transmute(x0, y0, width, height, mutation_size)
        The transmute method is a very core of the BboxTransmuter class and must be
        overridden in the subclasses. It receives the location and size of the rectan-
        gle, and the mutation_size, with which the amount of padding and etc. will be
        scaled. It returns a Path instance.
```

#### Examples using `matplotlib.patches.BoxStyle`

- `sphinx_glr_gallery_pyplots_whats_new_98_4_fancy.py`

- sphx\_glr\_gallery\_shapes\_and\_collections\_artist\_reference.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_fancybox\_demo.py

**matplotlib.patches.Circle**

class matplotlib.patches.Circle(xy, radius=5, \*\*kwargs)

Bases: *matplotlib.patches.Ellipse*

A circle patch.

Create true circle at center  $xy = (x, y)$  with given *radius*. Unlike *CirclePolygon* which is a polygonal approximation, this uses Bezier splines and is much closer to a scale-free circle.

Valid kwargs are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`get_radius()`  
Return the radius of the circle

`radius`  
Return the radius of the circle

`set_radius(radius)`  
Set the radius of the circle

### Parameters

**radius** [float]

### `matplotlib.patches.CirclePolygon`

`class matplotlib.patches.CirclePolygon(xy, radius=5, resolution=20, **kwargs)`

Bases: `matplotlib.patches.RegularPolygon`

A polygon-approximation of a circle patch.

Create a circle at  $xy = (x, y)$  with given *radius*. This circle is approximated by a regular polygon with *resolution* sides. For a smoother circle drawn with splines, see [Circle](#).

Valid kwargs are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<code>alpha</code>	float or None

Continued on next page

Table 153 – continued from previous page

Property	Description
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '-', '-.', ':', "", (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

### matplotlib.patches.ConnectionPatch

```
class matplotlib.patches.ConnectionPatch(xyA, xyB, coordsA, coordsB=None, axesA=None, axesB=None, arrowstyle='-', arrow_transmuter=None, connectionstyle='arc3', connector=None, patchA=None, patchB=None, shrinkA=0.0, shrinkB=0.0, mutation_scale=10.0, mutation_aspect=None, clip_on=False, dpi_cor=1.0, **kwargs)
```

Bases: *matplotlib.patches.FancyArrowPatch*

A *ConnectionPatch* class is to make connecting lines between two points (possibly in different axes).

Connect point *xyA* in *coordsA* with point *xyB* in *coordsB*

Valid keys are

Key	Description
<code>arrowstyle</code>	the arrow style
<code>connectionstyle</code>	the connection style
<code>relpos</code>	default is (0.5, 0.5)
<code>patchA</code>	default is bounding box of the text
<code>patchB</code>	default is None
<code>shrinkA</code>	default is 2 points
<code>shrinkB</code>	default is 2 points
<code>mutation_scale</code>	default is text size (in points)
<code>mutation_aspect</code>	default is 1.
<code>?</code>	any key for <code>matplotlib.patches.PathPatch</code>

`coordsA` and `coordsB` are strings that indicate the coordinates of `xyA` and `xyB`.

Property	Description
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0,0 is lower left of figure and 1,1 is upper, right
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0,1 is lower left of axes and 1,1 is upper right
'data'	use the coordinate system of the object being annotated (default)
'offset points'	Specify an offset (in points) from the <code>xy</code> value
'polar'	you can specify <i>theta</i> , <i>r</i> for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native "data" coordinate system.

`draw(renderer)`

Draw the *Patch* to the given *renderer*.

`get_annotation_clip()`

Return *annotation\_clip* attribute. See `set_annotation_clip()` for the meaning of return values.

`get_path_in_displaycoord()`

Return the mutated path of the arrow in the display coord

```
set_annotation_clip(b)
    set annotation_clip attribute.
```

- **True:** the annotation will only be drawn when `self.xy` is inside the axes.
- **False:** the annotation will always be drawn regardless of its position.
- `None`: the `self.xy` will be checked only if `xycoords` is "data"

#### Examples using `matplotlib.patches.ConnectionPatch`

- `sphx_glr_gallery_userdemo_connect_simple01.py`

#### `matplotlib.patches.ConnectionStyle`

```
class matplotlib.patches.ConnectionStyle
    Bases: matplotlib.patches._Style
```

`ConnectionStyle` is a container class which defines several connectionstyle classes, which is used to create a path between two points. These are mainly used with `FancyArrowPatch`.

A connectionstyle object can be either created as:

```
ConnectionStyle.Arc3(rad=0.2)
```

or:

```
ConnectionStyle("Arc3", rad=0.2)
```

or:

```
ConnectionStyle("Arc3", rad=0.2)
```

The following classes are defined

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
Angle3	angle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, angle=None

An instance of any connection style class is a callable object, whose call signature is:

```
__call__(self, posA, posB,
         patchA=None, patchB=None,
         shrinkA=2., shrinkB=2.)
```

and it returns a `Path` instance. `posA` and `posB` are tuples of x,y coordinates of the two points to be connected. `patchA` (or `patchB`) is given, the returned path is clipped so that it start (or end) from the boundary of the patch. The path is further shrunk by `shrinkA` (or `shrinkB`) which is given in points.

return the instance of the subclass with the given style name.

```
class Angle(angleA=90, angleB=0, rad=0.0)
```

```
    Bases: matplotlib.patches._Base
```

Creates a piecewise continuous quadratic Bezier path between two points. The path has a one passing-through point placed at the intersecting point of two lines which cross the start and end point, and have a slope of *angleA* and *angleB*, respectively. The connecting edges are rounded with *rad*.

***angleA*** starting angle of the path

***angleB*** ending angle of the path

***rad*** rounding radius of the edge

```
    connect(posA, posB)
```

```
class Angle3(angleA=90, angleB=0)
```

```
    Bases: matplotlib.patches._Base
```

Creates a simple quadratic Bezier curve between two points. The middle control points is placed at the intersecting point of two lines which cross the start and end point, and have a slope of *angleA* and *angleB*, respectively.

***angleA*** starting angle of the path

***angleB*** ending angle of the path

```
    connect(posA, posB)
```

```
class Arc(angleA=0, angleB=0, armA=None, armB=None, rad=0.0)
```

```
    Bases: matplotlib.patches._Base
```

Creates a piecewise continuous quadratic Bezier path between two points. The path can have two passing-through points, a point placed at the distance of *armA* and angle of *angleA* from point A, another point with respect to point B. The edges are rounded with *rad*.

***angleA*** : starting angle of the path

***angleB*** : ending angle of the path

***armA*** : length of the starting arm

***armB*** : length of the ending arm

***rad*** : rounding radius of the edges

```
    connect(posA, posB)
```

```
class Arc3(rad=0.0)
```

```
    Bases: matplotlib.patches._Base
```

Creates a simple quadratic Bezier curve between two points. The curve is created so that the middle control point (C1) is located at the same distance from the start (C0) and end points(C2) and the distance of the C1 to the line connecting C0-C2 is *rad* times the distance of C0-C2.

***rad*** curvature of the curve.

```
    connect(posA, posB)
```

```
class Bar(armA=0.0, armB=0.0, fraction=0.3, angle=None)
```

```
    Bases: matplotlib.patches._Base
```

A line with *angle* between A and B with *armA* and *armB*. One of the arms is extended so that they are connected in a right angle. The length of armA is determined by (*armA* + *fraction* x AB distance). Same for armB.

**Parameters**

**armA** [float] minimum length of armA

**armB** [float] minimum length of armB

**fraction** [float] a fraction of the distance between two points that will be added to armA and armB.

**angle** [float or None] angle of the connecting line (if None, parallel to A and B)

`connect(posA, posB)`

**matplotlib.patches.Ellipse**

`class matplotlib.patches.Ellipse(xy, width, height, angle=0, **kwargs)`

Bases: `matplotlib.patches.Patch`

A scale-free ellipse.

**Parameters**

**xy** [tuple of (scalar, scalar)] xy coordinates of ellipse centre.

**width** [scalar] Total length (diameter) of horizontal axis.

**height** [scalar] Total length (diameter) of vertical axis.

**angle** [scalar, optional] Rotation in degrees anti-clockwise.

**Notes**

Valid keyword arguments are

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}

Continued on next page

Table 154 – continued from previous page

Property	Description
<code>in_layout</code>	bool
<code>joinstyle</code>	{'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<code>linewidth</code>	float or None for default
<code>path_effects</code>	<i>AbstractPathEffect</i>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool or None
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<i>Transform</i>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

**center**

Return the center of the ellipse

**get\_center()**

Return the center of the ellipse

**get\_patch\_transform()**

Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

**get\_path()**

Return the vertices of the rectangle

**set\_center(xy)**

Set the center of the ellipse.

**Parameters**

**xy** [(float, float)]

**Examples using `matplotlib.patches.Ellipse`**

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_annotation\_demo.py

**matplotlib.patches.FancyArrow**

```
class matplotlib.patches.FancyArrow(x, y, dx, dy, width=0.001,
                                     length_includes_head=False, head_width=None,
                                     head_length=None, shape='full', overhang=0,
                                     head_starts_at_zero=False, **kwargs)
```

Bases: *matplotlib.patches.Polygon*

Like Arrow, but lets you set head width and head height independently.

**Constructor arguments**

- width: float (default: 0.001)** width of full arrow tail
- length\_includes\_head: bool (default: False)** True if head is to be counted in calculating the length.
- head\_width: float or None (default: 3\*width)** total width of the full arrow head
- head\_length: float or None (default: 1.5 \* head\_width)** length of arrow head
- shape: ['full', 'left', 'right'] (default: 'full')** draw the left-half, right-half, or full arrow
- overhang: float (default: 0)** fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.
- head\_starts\_at\_zero: bool (default: False)** if True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

Other valid kwargs (inherited from *Patch*) are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}

### matplotlib.patches.FancyArrowPatch

```
class matplotlib.patches.FancyArrowPatch(posA=None, posB=None, path=None, arrowstyle='simple', arrow_transmuter=None, connectionstyle='arc3', connector=None, patchA=None, patchB=None, shrinkA=2, shrinkB=2, mutation_scale=1, mutation_aspect=None, dpi_cor=1, **kwargs)
```

Bases: *matplotlib.patches.Patch*

A fancy arrow patch. It draws an arrow using the *ArrowStyle*.

The head and tail positions are fixed at the specified start and end points of the arrow, but the size and shape (in display coordinates) of the arrow does not change when the axis is moved or zoomed.

If *posA* and *posB* are given, a path connecting two points is created according to *connectionstyle*. The path will be clipped with *patchA* and *patchB* and further shrunken by *shrinkA* and *shrinkB*. An arrow is drawn along this resulting path using the *arrowstyle* parameter.

Alternatively if *path* is provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

#### Parameters

**posA, posB** [None, tuple, optional (default: None)] (x,y) coordinates of arrow tail and arrow head respectively.

**path** [None, Path (default: None)] *matplotlib.path.Path* instance. If provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

**arrowstyle** [str or *ArrowStyle*, optional (default: 'simple')]

Describes how the fancy arrow will be drawn. It can be string of the available arrowstyle names, with optional comma-separated attributes, or an *ArrowStyle* instance. The optional attributes

are meant to be scaled with the *mutation\_scale*. The following arrow styles are available:

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	-[	widthB=1.0, lengthB=0.2, angleB=None
Curve-FilledB	- >	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
Curve-FilledA	< -	head_length=0.4, head_width=0.2
Curve-FilledAB	< ->	head_length=0.4, head_width=0.2
BracketA	] -	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	] - [	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	simple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	-	widthA=1.0, angleA=None, widthB=1.0, angleB=None

**arrow\_transmuter** : Ignored

**connectionstyle** [str, ConnectionStyle, or None, optional]

(default: 'arc3')

Describes how *posA* and *posB* are connected. It can be an instance of the *ConnectionStyle* class or a string of the connectionstyle name, with optional comma-separated attributes. The following connection styles are available:

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
Angle3	angle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, angle=None

**connector** : Ignored

**patchA, patchB** [None, Patch, optional (default: None)] Head and tail patch respectively. `matplotlib.patch.Patch` instance.

**shrinkA, shrinkB** [scalar, optional (default: 2)] Shrinking factor of the tail and head of the arrow respectively

**mutation\_scale** [scalar, optional (default: 1)] Value with which attributes of *arrowstyle* (e.g., *head\_length*) will be scaled.

**mutation\_aspect** [None, scalar, optional (default: None)] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

**dpi\_cor** [scalar, optional (default: 1)] *dpi\_cor* is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

## Notes

Valid kwargs are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`draw(renderer)`

Draw the *Patch* to the given *renderer*.

`get_arrowstyle()`

Return the arrowstyle object.

`get_connectionstyle()`

Return the *ConnectionStyle* instance.

`get_dpi_cor()`

`dpi_cor` is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

#### Returns

**dpi\_cor** [scalar]

`get_mutation_aspect()`

Return the aspect ratio of the bbox mutation.

`get_mutation_scale()`

Return the mutation scale.

#### Returns

**scale** [scalar]

`get_path()`

Return the path of the arrow in the data coordinates. Use `get_path_in_displaycoord()` method to retrieve the arrow path in display coordinates.

`get_path_in_displaycoord()`

Return the mutated path of the arrow in display coordinates.

`set_arrowstyle(arrowstyle=None, **kw)`

Set the arrow style. Old attributes are forgotten. Without arguments (or with `arrowstyle=None`) returns available box styles as a list of strings.

#### Parameters

**arrowstyle** [None, ArrowStyle, str, optional (default: None)] Can be a string with arrowstyle name with optional comma-separated attributes, e.g.:

```
set_arrowstyle("Fancy,head_length=0.2")
```

Alternatively attributes can be provided as keywords, e.g.:

```
set_arrowstyle("fancy", head_length=0.2)
```

`set_connectionstyle(connectionstyle, **kw)`

Set the connection style. Old attributes are forgotten.

#### Parameters

**connectionstyle** [None, ConnectionStyle instance, or string] Can be a string with connectionstyle name with optional comma-separated attributes, e.g.:

```
set_connectionstyle("arc,angleA=0,armA=30,rad=10")
```

Alternatively, the attributes can be provided as keywords, e.g.:

```
set_connectionstyle("arc", angleA=0,armA=30,rad=10)
```

Without any arguments (or with `connectionstyle=None`), return available styles as a list of strings.

`set_dpi_cor(dpi_cor)`

`dpi_cor` is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

#### Parameters

**dpi\_cor** [scalar]

`set_mutation_aspect(aspect)`

Set the aspect ratio of the bbox mutation.

#### Parameters

**aspect** [scalar]

`set_mutation_scale(scale)`

Set the mutation scale.

#### Parameters

**scale** [scalar]

`set_patchA(patchA)`

Set the tail patch.

#### Parameters

**patchA** [Patch] `matplotlib.patch.Patch` instance.

`set_patchB(patchB)`

Set the head patch.

#### Parameters

**patchB** [Patch] `matplotlib.patch.Patch` instance.

`set_positions(posA, posB)`

Set the begin and end positions of the connecting path.

#### Parameters

**posA**, **posB** [None, tuple] (x,y) coordinates of arrow tail and arrow head respectively. If `None` use current value.

#### Examples using `matplotlib.patches.FancyArrowPatch`

- `sphx_glr_gallery_shapes_and_collections_arrow_guide.py`

#### `matplotlib.patches.FancyBboxPatch`

```
class matplotlib.patches.FancyBboxPatch(xy, width, height, boxstyle='round',
                                         bbox_transmuter=None, mutation_scale=1.0,
                                         mutation_aspect=None, **kwargs)
```

Bases: `matplotlib.patches.Patch`

Draw a fancy box around a rectangle with lower left at `xy*=(*x, y)` with specified width and height.

*FancyBboxPatch* class is similar to *Rectangle* class, but it draws a fancy box around the rectangle. The transformation of the rectangle box to the fancy box is delegated to the *BoxTranmuterBase* and its derived classes.

*xy* = lower left corner

*width, height*

*boxstyle* determines what kind of fancy box will be drawn. It can be a string of the style name with a comma separated attribute, or an instance of *BoxStyle*. Following box styles are available.

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

*mutation\_scale* : a value with which attributes of *boxstyle* (e.g., *pad*) will be scaled. default=1.

*mutation\_aspect* : The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. default=None.

Valid kwargs are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path, Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', ':', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-.', '-.', '-.', ':', ':', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>

Continued on next page

Table 157 – continued from previous page

Property	Description
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`get_bbox()`

`get_boxstyle()`

Return the boxstyle object

`get_height()`

Return the height of the rectangle

`get_mutation_aspect()`

Return the aspect ratio of the bbox mutation.

`get_mutation_scale()`

Return the mutation scale.

`get_path()`

Return the mutated path of the rectangle

`get_width()`

Return the width of the rectangle

`get_x()`

Return the left coord of the rectangle

`get_y()`

Return the bottom coord of the rectangle

`set_bounds(*args)`

Set the bounds of the rectangle: l,b,w,h

ACCEPTS: (left, bottom, width, height)

`set_boxstyle(boxstyle=None, **kw)`

Set the box style.

*boxstyle* can be a string with boxstyle name with optional comma-separated attributes. Alternatively, the attrs can be provided as keywords:

```
set_boxstyle("round,pad=0.2")
set_boxstyle("round", pad=0.2)
```

Old attrs simply are forgotten.

Without argument (or with *boxstyle* = None), it returns available box styles.

The following boxstyles are available:

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

ACCEPTS: [ 'circle' | 'darrow' | 'larrow' | 'rarrow' | 'round' | 'round4' | 'roundtooth' | 'sawtooth' | 'square' ]

`set_height(h)`

Set the rectangle height.

**Parameters**

**h** [float]

`set_mutation_aspect(aspect)`

Set the aspect ratio of the bbox mutation.

**Parameters**

**aspect** [float]

`set_mutation_scale(scale)`

Set the mutation scale.

**Parameters**

**scale** [float]

`set_width(w)`

Set the rectangle width.

**Parameters**

**w** [float]

`set_x(x)`

Set the left coord of the rectangle.

**Parameters**

**x** [float]

`set_y(y)`

Set the bottom coord of the rectangle.

**Parameters**

**y** [float]

Examples using `matplotlib.patches.FancyBboxPatch`

- `sphinx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphinx_glr_gallery_shapes_and_collections_fancybox_demo.py`

**matplotlib.patches.Patch**

```
class matplotlib.patches.Patch(edgecolor=None, facecolor=None, color=None,
                               linewidth=None, linestyle=None, antialiased=None,
                               hatch=None, fill=True, capstyle=None, join-
                               style=None, **kwargs)
```

Bases: `matplotlib.artist.Artist`

A patch is a 2D artist with a face color and an edge color.

If any of `edgecolor`, `facecolor`, `linewidth`, or `antialiased` are `None`, they default to their rc params setting.

The following kwarg properties are supported

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>antialiased</code>	unknown
<code>capstyle</code>	{'butt', 'round', 'projecting'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	[( <code>Path</code> , <code>Transform</code> )   <code>Patch</code>   None]
<code>color</code>	color
<code>contains</code>	callable
<code>edgecolor</code>	color or None or 'auto'
<code>facecolor</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	{'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code>	{'-', '-', '-.', ':', ", (offset, on-off-seq), ...}
<code>linewidth</code>	float or None for default
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool or None
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

`contains(mouseevent, radius=None)`

Test whether the mouse event occurred in the patch.

Returns T/F, {}

`contains_point(point, radius=None)`

Returns True if the given `point` is inside the path (transformed with its transform attribute).

*radius* allows the path to be made slightly larger or smaller.

`contains_points(points, radius=None)`

Returns a bool array which is True if the (closed) path contains the corresponding point. (transformed with its transform attribute).

*points* must be Nx2 array. *radius* allows the path to be made slightly larger or smaller.

`draw(renderer)`

Draw the *Patch* to the given *renderer*.

`fill`

return whether fill is set

`get_aa(*args, **kwargs)`

alias for `get_antialiased`

`get_antialiased()`

Returns True if the *Patch* is to be drawn with antialiasing.

`get_capstyle()`

Return the current capstyle

`get_data_transform()`

Return the *Transform* instance which maps data coordinates to physical coordinates.

`get_ec(*args, **kwargs)`

alias for `get_edgecolor`

`get_edgecolor()`

Return the edge color of the *Patch*.

`get_extents()`

Return a *Bbox* object defining the axis-aligned extents of the *Patch*.

`get_facecolor()`

Return the face color of the *Patch*.

`get_fc(*args, **kwargs)`

alias for `get_facecolor`

`get_fill()`

return whether fill is set

`get_hatch()`

Return the current hatching pattern

`get_joinstyle()`

Return the current joinstyle

`get_linestyle()`

Return the linestyle.

`get_linewidth()`

Return the line width in points.

`get_ls(*args, **kwargs)`

alias for `get_linestyle`

`get_lw(*args, **kwargs)`

alias for `get_linewidth`

`get_patch_transform()`

Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path()`

Return the path of this patch

`get_transform()`

Return the *Transform* applied to the *Patch*.

`get_verts()`

Return a copy of the vertices used in this patch

If the patch contains Bezier curves, the curves will be interpolated by line segments. To access the curves as curves, use `get_path()`.

`get_window_extent(renderer=None)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`set_aa(*args, **kwargs)`

alias for `set_antialiased`

`set_alpha(alpha)`

Set the alpha transparency of the patch.

#### Parameters

**alpha** [float or None]

`set_antialiased(aa)`

Set whether to use antialiased rendering.

#### Parameters

**b** [bool or None]

`set_capstyle(s)`

Set the patch capstyle

#### Parameters

**s** [{'butt', 'round', 'projecting'}]

`set_color(c)`

Set both the edgecolor and the facecolor.

#### See also:

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

#### Parameters

**c** [color]

`set_ec(*args, **kwargs)`  
alias for `set_edgecolor`

`set_edgecolor(color)`  
Set the patch edge color.

**Parameters**

**color** [color or None or 'auto']

`set_facecolor(color)`  
Set the patch face color.

**Parameters**

**color** [color or None]

`set_fc(*args, **kwargs)`  
alias for `set_facecolor`

`set_fill(b)`  
Set whether to fill the patch.

**Parameters**

**b** [bool]

`set_hatch(hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

**Parameters**

**hatch** [{'/', '\\', '|', '-', '+', 'x', 'o', 'O', '.', '\*'}]

`set_joinstyle(s)`  
Set the patch joinstyle

**Parameters**

**s** [{'miter', 'round', 'bevel'}]

`set_linestyle(ls)`  
Set the patch linestyle.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [ {'-', '-', '-.', ':', ':', (offset, on-off-seq), ...} ] The line style.

`set_linewidth(w)`

Set the patch linewidth in points

ACCEPTS: float or None for default

`set_ls(*args, **kwargs)`

alias for `set_linestyle`

`set_lw(*args, **kwargs)`

alias for `set_linewidth`

`update_from(other)`

Updates this *Patch* from the properties of *other*.

`validCap = ('butt', 'round', 'projecting')`

`validJoin = ('miter', 'round', 'bevel')`

`zorder = 1`

### Examples using `matplotlib.patches.Patch`

- [sphx\\_glr\\_gallery\\_text\\_labels\\_and\\_annotations\\_custom\\_legends.py](#)
- [Legend guide](#)

### `matplotlib.patches.PathPatch`

`class matplotlib.patches.PathPatch(path, **kwargs)`

Bases: `matplotlib.patches.Patch`

A general polycurve path patch.

*path* is a `matplotlib.path.Path` object.

Valid kwargs are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<code>alpha</code>	float or None

Continued on next page

Table 159 – continued from previous page

Property	Description
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', "", (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

**See also:**

*Patch* For additional kwargs

`get_path()`

Return the path of this patch

**Examples using `matplotlib.patches.PathPatch`**

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_demo.py

### matplotlib.patches.Polygon

class matplotlib.patches.Polygon(xy, closed=True, \*\*kwargs)

Bases: *matplotlib.patches.Patch*

A general polygon patch.

xy is a numpy array with shape Nx2.

If *closed* is *True*, the polygon will be closed so the starting and ending points are the same.

Valid kwargs are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None

Continued on next page

Table 160 – continued from previous page

Property	Description
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

**See also:**

*Patch* For additional kwargs

`get_closed()`  
Returns if the polygon is closed

**Returns**

**closed** [bool] If the path is closed

`get_path()`  
Get the path of the polygon

**Returns**

**path** [Path] The *Path* object for the polygon

`get_xy()`  
Get the vertices of the path.

**Returns**

**vertices** [(N, 2) numpy array] The coordinates of the vertices.

`set_closed(closed)`  
Set if the polygon is closed

**Parameters**

**closed** [bool] True if the polygon is closed

`set_xy(xy)`  
Set the vertices of the polygon.

**Parameters**

**xy** [(N, 2) array-like] The coordinates of the vertices.

*xy*  
The vertices of the path as (N, 2) numpy array.

**Examples using `matplotlib.patches.Polygon`**

- `sphx_glr_gallery_statistics_boxplot_demo.py`
- `sphx_glr_gallery_shapes_and_collections_hatch_demo.py`

- `sphx_glr_gallery_showcase_integral.py`
- `sphx_glr_gallery_event_handling_poly_editor.py`

- sphx\_glr\_gallery\_event\_handling\_trifinder\_event\_demo.py

### matplotlib.patches.Rectangle

class matplotlib.patches.Rectangle(xy, width, height, angle=0.0, \*\*kwargs)

Bases: *matplotlib.patches.Patch*

Draw a rectangle with lower left at xy = (x, y) with specified *width*, *height* and rotation *angle*.

#### Parameters

- xy: length-2 tuple** The bottom and left rectangle coordinates
- width:** Rectangle width
- height:** Rectangle height
- angle: float, optional** rotation in degrees anti-clockwise about xy (default is 0.0)
- fill: bool, optional** Whether to fill the rectangle (default is True)

#### Notes

Valid kwargs are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', ':', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '-.', '-.-', ':', '-', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)

Continued on next page

Table 161 – continued from previous page

Property	Description
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`get_bbox()`

`get_height()`

Return the height of the rectangle.

`get_patch_transform()`

Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path()`

Return the vertices of the rectangle.

`get_width()`

Return the width of the rectangle.

`get_x()`

Return the left coord of the rectangle.

`get_xy()`

Return the left and bottom coords of the rectangle.

`get_y()`

Return the bottom coord of the rectangle.

`set_bounds(*args)`

Set the bounds of the rectangle: l,b,w,h

ACCEPTS: (left, bottom, width, height)

`set_height(h)`

Set the height of the rectangle.

`set_width(w)`

Set the width of the rectangle.

`set_x(x)`

Set the left coord of the rectangle.

`set_xy(xy)`

Set the left and bottom coords of the rectangle.

### Parameters

**xy** [2-item sequence]

`set_y(y)`

Set the bottom coord of the rectangle.

**xy**

Return the left and bottom coords of the rectangle.

**Examples using `matplotlib.patches.Rectangle`**

- `sphinx_glr_gallery_statistics_errorbars_and_boxes.py`
- `sphinx_glr_gallery_pyplots_text_layout.py`

**`matplotlib.patches.RegularPolygon`**

```
class matplotlib.patches.RegularPolygon(xy, numVertices, radius=5, orientation=0,
                                       **kwargs)
```

Bases: `matplotlib.patches.Patch`

A regular polygon patch.

Constructor arguments:

**xy** A length 2 tuple (x, y) of the center.

**numVertices** the number of vertices.

**radius** The distance from the center to each of the vertices.

**orientation** rotates the polygon (in radians).

Valid kwargs are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>antialiased</code>	unknown
<code>capstyle</code>	{'butt', 'round', 'projecting'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	[( <code>Path</code> , <code>Transform</code> )   <code>Patch</code>   None]
<code>color</code>	color
<code>contains</code>	callable
<code>edgecolor</code>	color or None or 'auto'
<code>facecolor</code>	color or None
<code>figure</code>	<code>Figure</code>

Continued on next page

Table 162 – continued from previous page

Property	Description
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`get_patch_transform()`

Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path()`

Return the path of this patch

`numvertices`

`orientation`

`radius`

`xy`

#### Examples using `matplotlib.patches.RegularPolygon`

- `sphx_glr_gallery_shapes_and_collections_artist_reference.py`

#### `matplotlib.patches.Shadow`

`class matplotlib.patches.Shadow(patch, ox, oy, props=None, **kwargs)`

Bases: `matplotlib.patches.Patch`

Create a shadow of the given *patch* offset by *ox*, *oy*. *props*, if not *None*, is a patch property update dictionary. If *None*, the shadow will have have the same color as the face, but darkened.

*kwargs* are

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '-', '-.', ':', ", (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`draw(renderer)`

Draw the *Patch* to the given *renderer*.

`get_patch_transform()`

Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path()`

Return the path of this patch

#### Examples using `matplotlib.patches.Shadow`

- `sphx_glr_gallery_text_labels_and_annotations_demo_text_path.py`
- `sphx_glr_gallery_misc_svg_filter_pie.py`

**matplotlib.patches.Wedge**

```
class matplotlib.patches.Wedge(center, r, theta1, theta2, width=None, **kwargs)
```

Bases: *matplotlib.patches.Patch*

Wedge shaped patch.

Draw a wedge centered at  $x, y$  center with radius  $r$  that sweeps  $theta1$  to  $theta2$  (in degrees). If  $width$  is given, then a partial wedge is drawn from inner radius  $r - width$  to outer radius  $r$ .

Valid kwargs are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
get_path()
```

Return the path of this patch

```
set_center(center)
```

```
set_radius(radius)
```

```
set_theta1(theta1)
```

```
set_theta2(theta2)
set_width(width)
```

#### Examples using `matplotlib.patches.Wedge`

- `sphinx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphinx_glr_gallery_shapes_and_collections_patch_collection.py`

#### `matplotlib.patches.YAArrow`

```
class matplotlib.patches.YAArrow(**kwargs)
```

Bases: `matplotlib.patches.Patch`

Deprecated since version 3.0: The YAArrow class was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use FancyArrowPatch instead.

Yet another arrow class.

This is an arrow that is defined in display space and has a tip at  $x1, y1$  and a base at  $x2, y2$ .

```
get_patch_transform()
```

Return the `Transform` instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

```
get_path()
```

Return the path of this patch

```
getpoints(x1, y1, x2, y2, k)
```

For line segment defined by  $(x1, y1)$  and  $(x2, y2)$  return the points on the line that is perpendicular to the line and intersects  $(x2, y2)$  and the distance from  $(x2, y2)$  of the returned points is  $k$ .

#### Functions

---

```
bbox_artist(artist, renderer[, props, fill])
```

This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct `bbox`.

---

```
draw_bbox(bbox, renderer[, color, trans])
```

This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct `bbox`.

---

### matplotlib.patches.bbox\_artist

`matplotlib.patches.bbox_artist(artist, renderer, props=None, fill=True)`

This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct bbox.

`props` is a dict of rectangle props with the additional property 'pad' that sets the padding around the bbox in points.

### matplotlib.patches.draw\_bbox

`matplotlib.patches.draw_bbox(bbox, renderer, color='k', trans=None)`

This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct bbox.

## 18.31 path

### 18.31.1 matplotlib.path

A module for dealing with the polylines used throughout Matplotlib.

The primary class for polyline handling in Matplotlib is `Path`. Almost all vector drawing makes use of `Paths` somewhere in the drawing pipeline.

Whilst a `Path` instance itself cannot be drawn, some `Artist` subclasses, such as `PathPatch` and `PathCollection`, can be used for convenient `Path` visualisation.

```
class matplotlib.path.Path(vertices, codes=None, _interpolation_steps=1,
                           closed=False, readonly=False)
```

Bases: `object`

`Path` represents a series of possibly disconnected, possibly closed, line and curve segments.

#### The underlying storage is made up of two parallel numpy arrays:

- `vertices`: an Nx2 float array of vertices
- `codes`: an N-length uint8 array of vertex types

These two arrays always have the same length in the first dimension. For example, to represent a cubic curve, you must provide three vertices as well as three codes `CURVE3`.

The code types are:

- `STOP` [1 vertex (ignored)] A marker for the end of the entire path (currently not required and ignored)
- `MOVETO` [1 vertex] Pick up the pen and move to the given vertex.
- `LINETO` [1 vertex] Draw a line from the current position to the given vertex.
- `CURVE3` [1 control point, 1 endpoint] Draw a quadratic Bezier curve from the current position, with the given control point, to the given end point.
- `CURVE4` [2 control points, 1 endpoint] Draw a cubic Bezier curve from the current position, with the given control points, to the given end point.

- **CLOSEPOLY** [1 vertex (ignored)] Draw a line segment to the start point of the current polyline.

Users of Path objects should not access the vertices and codes arrays directly. Instead, they should use `iter_segments()` or `cleaned()` to get the vertex/code pairs. This is important, since many `Path` objects, as an optimization, do not store a `codes` at all, but have a default one provided for them by `iter_segments()`.

Some behavior of Path objects can be controlled by rcParams. See the rcParams whose keys contain 'path'.

---

**Note:** The vertices and codes arrays should be treated as immutable - there are a number of optimizations and assumptions made up front in the constructor that will not change when the data changes.

---

Create a new path with the given vertices and codes.

### Parameters

**vertices** [array\_like] The (n, 2) float array, masked array or sequence of pairs representing the vertices of the path.

If *vertices* contains masked values, they will be converted to NaNs which are then handled correctly by the Agg PathIterator and other consumers of path data, such as `iter_segments()`.

**codes** [{None, array\_like}, optional] n-length array integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, *vertices* will be treated as a series of line segments.

**\_interpolation\_steps** [int, optional] Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

**closed** [bool, optional] If *codes* is None and closed is True, vertices will be treated as line segments of a closed polygon.

**readonly** [bool, optional] Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

CLOSEPOLY = 79

CURVE3 = 3

CURVE4 = 4

LINETO = 2

MOVETO = 1

NUM\_VERTICES\_FOR\_CODE = {0: 1, 1: 1, 2: 1, 3: 2, 4: 3, 79: 1}

A dictionary mapping Path codes to the number of vertices that the code expects.

STOP = 0

`classmethod arc(theta1, theta2, n=None, is_wedge=False)`

Return an arc on the unit circle from angle *theta1* to angle *theta2* (in degrees).

*theta2* is unwrapped to produce the shortest arc within 360 degrees. That is, if *theta2* > *theta1* + 360, the arc will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

Masionobe, L. 2003. [Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves.](#)

`classmethod circle(center=(0.0, 0.0), radius=1.0, readonly=False)`

Return a Path representing a circle of a given radius and center.

### Parameters

**center** [pair of floats] The center of the circle. Default (0, 0).

**radius** [float] The radius of the circle. Default is 1.

**readonly** [bool] Whether the created path should have the "readonly" argument set when creating the Path instance.

### Notes

The circle is approximated using cubic Bezier curves. This uses 8 splines around the circle using the approach presented here:

Lancaster, Don. [Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.](#)

`cleaned(transform=None, remove_nans=False, clip=None, quantize=False, simplify=False, curves=False, stroke_width=1.0, snap=False, sketch=None)`

Cleans up the path according to the parameters returning a new Path instance.

### See also:

See `iter_segments()` for details of the keyword arguments.

### Returns

**Path instance with cleaned up vertices and codes.**

`clip_to_bbox(bbox, inside=True)`

Clip the path to the given bounding box.

The path must be made up of one or more closed polygons. This algorithm will not behave correctly for unclosed paths.

If *inside* is `True`, clip to the inside of the box, otherwise to the outside of the box.

`code_type`

alias of `numpy.uint8`

`codes`

The list of codes in the *Path* as a 1-D numpy array. Each code is one of `STOP`, `MOVETO`, `LINETO`, `CURVE3`, `CURVE4` or `CLOSEPOLY`. For codes that correspond to more than one vertex (`CURVE3` and `CURVE4`), that code will be repeated so that the length of `self.vertices` and `self.codes` is always the same.

`contains_path(path, transform=None)`

Returns whether this (closed) path completely contains the given path.

If *transform* is not `None`, the path will be transformed before performing the test.

`contains_point(point, transform=None, radius=0.0)`  
 Returns whether the (closed) path contains the given point.  
 If *transform* is not `None`, the path will be transformed before performing the test.  
*radius* allows the path to be made slightly larger or smaller.

`contains_points(points, transform=None, radius=0.0)`  
 Returns a bool array which is `True` if the (closed) path contains the corresponding point.  
 If *transform* is not `None`, the path will be transformed before performing the test.  
*radius* allows the path to be made slightly larger or smaller.

`copy()`  
 Returns a shallow copy of the *Path*, which will share the vertices and codes with the source *Path*.

`deepcopy(memo=None)`  
 Returns a deepcopy of the *Path*. The *Path* will not be readonly, even if the source *Path* is.

`get_extents(transform=None)`  
 Returns the extents (*xmin*, *ymin*, *xmax*, *ymax*) of the path.  
 Unlike computing the extents on the *vertices* alone, this algorithm will take into account the curves and deal with control points appropriately.

`has_nonfinite`  
`True` if the vertices array has nonfinite values.

`hatch`  
 Given a hatch specifier, *hatchpattern*, generates a *Path* that can be used in a repeated hatching pattern. *density* is the number of lines per unit square.

`interpolated(steps)`  
 Returns a new path resampled to length *N* x *steps*. Does not currently handle interpolating curves.

`intersects_bbox(bbox, filled=True)`  
 Returns `True` if this path intersects a given *Bbox*.  
*filled*, when `True`, treats the path as if it was filled. That is, if the path completely encloses the bounding box, `intersects_bbox()` will return `True`.  
 The bounding box is always considered filled.

`intersects_path(other, filled=True)`  
 Returns `True` if this path intersects another given path.  
*filled*, when `True`, treats the paths as if they were filled. That is, if one path completely encloses the other, `intersects_path()` will return `True`.

`iter_segments(transform=None, remove_nans=True, clip=None, snap=False, stroke_width=1.0, simplify=None, curves=True, sketch=None)`  
 Iterates over all of the curve segments in the path. Each iteration returns a 2-tuple (*vertices*, *code*), where *vertices* is a sequence of 1 - 3 coordinate pairs, and *code* is one of the *Path* codes.  
 Additionally, this method can provide a number of standard cleanups and conversions to the path.

### Parameters

**transform** [None or *Transform* instance] If not None, the given affine transformation will be applied to the path.

**remove\_nans** [{False, True}, optional] If True, will remove all NaNs from the path and insert MOVETO commands to skip over them.

**clip** [None or sequence, optional] If not None, must be a four-tuple (x1, y1, x2, y2) defining a rectangle in which to clip the path.

**snap** [None or bool, optional] If None, auto-snap to pixels, to reduce fuzziness of rectilinear lines. If True, force snapping, and if False, don't snap.

**stroke\_width** [float, optional]

**The width of the stroke being drawn. Needed** as a hint for the snapping algorithm.

**simplify** [None or bool, optional]

**If True, perform simplification, to remove** vertices that do not affect the appearance of the path. If False, perform no simplification. If None, use the `should_simplify` member variable. See also the `rcParams.path.simplify` and `path.simplify_threshold`.

**curves** [{True, False}, optional] If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

**sketch** [None or sequence, optional] If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.

`classmethod make_compound_path(*args)`

Make a compound path from a list of *Path* objects.

`classmethod make_compound_path_from_polys(XY)`

Make a compound path object to draw a number of polygons with equal numbers of sides XY is a (numpolys x numsides x 2) numpy array of vertices. Return object is a *Path*

`readonly`

True if the *Path* is read-only.

`should_simplify`

True if the vertices array should be simplified.

`simplify_threshold`

The fraction of a pixel difference below which vertices will be simplified out.

`to_polygons(transform=None, width=0, height=0, closed_only=True)`

Convert this path to a list of polygons or polylines. Each polygon/polyline is an Nx2 array of vertices. In other words, each polygon has no MOVETO instructions or curves. This is useful for displaying in backends that do not support compound paths or Bezier curves.

If *width* and *height* are both non-zero then the lines will be simplified so that vertices outside of (0, 0), (width, height) will be clipped.

If *closed\_only* is True (default), only closed polygons, with the last point being the same as the first point, will be returned. Any unclosed polylines in the path will be explicitly closed. If *closed\_only* is False, any unclosed polygons in the path will be

returned as unclosed polygons, and the closed polygons will be returned explicitly closed by setting the last point to the same as the first point.

`transformed(transform)`

Return a transformed copy of the path.

**See also:**

[`matplotlib.transforms.TransformPath`](#) A specialized path class that will cache the transformed result and automatically update when the transform changes.

`classmethod unit_circle()`

Return the readonly `Path` of the unit circle.

For most cases, `Path.circle()` will be what you want.

`classmethod unit_circle_righthalf()`

Return a `Path` of the right half of a unit circle. The circle is approximated using cubic Bezier curves. This uses 4 splines around the circle using the approach presented here:

Lancaster, Don. [Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines](#).

`classmethod unit_rectangle()`

Return a `Path` instance of the unit rectangle from (0, 0) to (1, 1).

`classmethod unit_regular_asterisk(numVertices)`

Return a `Path` for a unit regular asterisk with the given `numVertices` and radius of

1.0, centered at (0, 0).

`classmethod unit_regular_polygon(numVertices)`

Return a *Path* instance for a unit regular polygon with the given *numVertices* and radius of 1.0, centered at (0, 0).

`classmethod unit_regular_star(numVertices, innerCircle=0.5)`

Return a *Path* for a unit regular star with the given *numVertices* and radius of 1.0, centered at (0, 0).

`vertices`

The list of vertices in the *Path* as an Nx2 numpy array.

`classmethod wedge(theta1, theta2, n=None)`

Return a wedge of the unit circle from angle *theta1* to angle *theta2* (in degrees).

*theta2* is unwrapped to produce the shortest wedge within 360 degrees. That is, if *theta2* > *theta1* + 360, the wedge will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

`matplotlib.path.get_path_collection_extents(master_transform, paths, transforms, offsets, offset_transform)`

Given a sequence of *Path* objects, *Transform* objects and offsets, as found in a *PathCollection*, returns the bounding box that encapsulates all of them.

*master\_transform* is a global transformation to apply to all paths

*paths* is a sequence of *Path* instances.

*transforms* is a sequence of *Affine2D* instances.

*offsets* is a sequence of (x, y) offsets (or an Nx2 array)

*offset\_transform* is a *Affine2D* to apply to the offsets before applying the offset to the path.

The way that *paths*, *transforms* and *offsets* are combined follows the same method as for collections. Each is iterated over independently, so if you have 3 paths, 2 transforms and 1 offset, their combinations are as follows:

(A, A, A), (B, B, A), (C, A, A)

`matplotlib.path.get_paths_extents(paths, transforms=[])`

Given a sequence of *Path* objects and optional *Transform* objects, returns the bounding box that encapsulates all of them.

*paths* is a sequence of *Path* instances.

*transforms* is an optional sequence of *Affine2D* instances to apply to each path.

## 18.32 patheffects

### 18.32.1 matplotlib.patheffects

Defines classes for path effects. The path effects are supported in *Text*, *Line2D* and *Patch*.

---

```
class matplotlib.patheffects.AbstractPathEffect(offset=(0.0, 0.0))
```

Bases: `object`

A base class for path effects.

Subclasses should override the `draw_path` method to add effect functionality.

### Parameters

**offset** [pair of floats] The offset to apply to the path, measured in points.

```
draw_path(renderer, gc, tpath, affine, rgbFace=None)
```

Derived should override this method. The arguments are the same as `matplotlib.backend_bases.RendererBase.draw_path()` except the first argument is a renderer.

```
class matplotlib.patheffects.Normal(offset=(0.0, 0.0))
```

Bases: `matplotlib.patheffects.AbstractPathEffect`

The "identity" PathEffect.

The Normal PathEffect's sole purpose is to draw the original artist with no special path effect.

### Parameters

**offset** [pair of floats] The offset to apply to the path, measured in points.

```
class matplotlib.patheffects.PathEffectRenderer(path_effects, renderer)
```

Bases: `matplotlib.backend_bases.RendererBase`

Implements a Renderer which contains another renderer.

This proxy then intercepts draw calls, calling the appropriate `AbstractPathEffect` draw method.

---

**Note:** Not all methods have been overridden on this `RendererBase` subclass. It may be necessary to add further methods to extend the `PathEffects` capabilities further.

---

### Parameters

**path\_effects** [iterable of `AbstractPathEffect`] The path effects which this renderer represents.

**renderer** [`matplotlib.backend_bases.RendererBase` instance]

```
copy_with_path_effect(path_effects)
```

```
draw_markers(gc, marker_path, marker_trans, path, *args, **kwargs)
```

Draws a marker at each of the vertices in `path`. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

**gc** [`GraphicsContextBase`] The graphics context

**marker\_trans** [`matplotlib.transforms.Transform`] An affine transform applied to the marker.

**trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_path(gc, tpath, affine, rgbFace=None)`

Draws a *Path* instance using the given affine transform.

`draw_path_collection(gc, master_transform, paths, *args, **kwargs)`

Draws a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied. *offset\_position* may be either "screen" or "data" depending on the space that the offsets are in.

This provides a fallback implementation of *draw\_path\_collection()* that makes multiple calls to *draw\_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods *\_iter\_collection\_raw\_paths()* and *\_iter\_collection()* are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw\_path\_collection()* can be made globally.

`new_gc()`

Return an instance of a *GraphicsContextBase*

`points_to_pixels(points)`

Convert points to display units

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72.0 * dpi/72.0
```

### Parameters

**points** [scalar or array\_like] a float or a numpy array of float

### Returns

**Points converted to pixels**

`class matplotlib.patheffects.PathPatchEffect(offset=(0, 0), **kwargs)`

Bases: *matplotlib.patheffects.AbstractPathEffect*

Draws a *PathPatch* instance whose *Path* comes from the original *PathEffect* artist.

### Parameters

**offset** [pair of floats] The offset to apply to the path, in points.

**\*\*kwargs** : All keyword arguments are passed through to the *PathPatch* constructor. The properties which cannot be overridden are "path", "clip\_box" "transform" and "clip\_path".

`draw_path(renderer, gc, tpath, affine, rgbFace)`

Derived should override this method. The arguments are the same as *matplotlib.backend\_bases.RendererBase.draw\_path()* except the first argument is a renderer.

`class matplotlib.patheffects.SimpleLineShadow(offset=(2, -2), shadow_color='k', alpha=0.3, rho=0.3, **kwargs)`

Bases: *matplotlib.patheffects.AbstractPathEffect*

A simple shadow via a line.

### Parameters

**offset** [pair of floats] The offset to apply to the path, in points.

**shadow\_color** [color] The shadow color. Default is black. A value of `None` takes the original artist's color with a scale factor of `rho`.

**alpha** [float] The alpha transparency of the created shadow patch. Default is 0.3.

**rho** [float] A scale factor to apply to the `rgbFace` color if `shadow_rgbFace` is `None`. Default is 0.3.

**\*\*kwargs** Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path(renderer, gc, tpath, affine, rgbFace)`

Overrides the standard `draw_path` to add the shadow offset and necessary color changes for the shadow.

```
class matplotlib.patheffects.SimplePatchShadow(offset=(2, -2), shadow_rgbFace=None,
                                              alpha=None, rho=0.3, **kwargs)
```

Bases: `matplotlib.patheffects.AbstractPathEffect`

A simple shadow via a filled patch.

### Parameters

**offset** [pair of floats] The offset of the shadow in points.

**shadow\_rgbFace** [color] The shadow color.

**alpha** [float] The alpha transparency of the created shadow patch. Default is 0.3. <http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html>

**rho** [float] A scale factor to apply to the `rgbFace` color if `shadow_rgbFace` is not specified. Default is 0.3.

**\*\*kwargs** Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path(renderer, gc, tpath, affine, rgbFace)`

Overrides the standard `draw_path` to add the shadow offset and necessary color changes for the shadow.

```
class matplotlib.patheffects.Stroke(offset=(0, 0), **kwargs)
```

Bases: `matplotlib.patheffects.AbstractPathEffect`

A line based `PathEffect` which re-draws a stroke.

The path will be stroked with its `gc` updated with the given keyword arguments, i.e., the keyword arguments should be valid `gc` parameter values.

`draw_path(renderer, gc, tpath, affine, rgbFace)`

draw the path with updated `gc`.

```
class matplotlib.patheffects.withSimplePatchShadow(offset=(2, -2),
                                                  shadow_rgbFace=None,
                                                  alpha=None, rho=0.3, **kwargs)
```

Bases: `matplotlib.patheffects.SimplePatchShadow`

Adds a simple *SimplePatchShadow* and then draws the original Artist to avoid needing to call *Normal*.

### Parameters

**offset** [pair of floats] The offset of the shadow in points.

**shadow\_rgbFace** [color] The shadow color.

**alpha** [float] The alpha transparency of the created shadow patch. Default is 0.3. <http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html>

**rho** [float] A scale factor to apply to the rgbFace color if shadow\_rgbFace is not specified. Default is 0.3.

**\*\*kwargs** Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path(renderer, gc, tpath, affine, rgbFace)`

Overrides the standard `draw_path` to add the shadow offset and necessary color changes for the shadow.

`class matplotlib.patheffects.withStroke(offset=(0, 0), **kwargs)`

Bases: `matplotlib.patheffects.Stroke`

Adds a simple *Stroke* and then draws the original Artist to avoid needing to call *Normal*.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

`draw_path(renderer, gc, tpath, affine, rgbFace)`

draw the path with updated gc.

## 18.33 projections

### 18.33.1 matplotlib.projections

`class matplotlib.projections.ProjectionRegistry`

Bases: `object`

Manages the set of projections available to the system.

`get_projection_class(name)`

Get a projection class from its *name*.

`get_projection_names()`

Get a list of the names of all projections currently registered.

`register(*projections)`

Register a new set of projections.

`matplotlib.projections.get_projection_class(projection=None)`

Get a projection class from its name.

If *projection* is *None*, a standard rectilinear projection is returned.

`matplotlib.projections.get_projection_names()`

Get a list of acceptable projection names.

`matplotlib.projections.process_projection_requirements`(*figure*, \**args*, *polar=False*, *projection=None*, \*\**kwargs*)  
 Handle the args/kwargs to `add_axes/add_subplot/gca`, returning:

```
(axes_proj_class, proj_class_kwargs, proj_stack_key)
```

which can be used for new axes initialization/identification.

`matplotlib.projections.register_projection`(*cls*)

### 18.33.2 `matplotlib.projections.polar`

```
class matplotlib.projections.polar.InvertedPolarTransform(axis=None,
                                                         use_rmin=True, _apply_theta_transforms=True)
```

Bases: `matplotlib.transforms.Transform`

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

`input_dims = 2`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

`is_separable = False`

`output_dims = 2`

`transform_non_affine(xy)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

```
class matplotlib.projections.polar.PolarAffine(scale_transform, limits)
```

Bases: `matplotlib.transforms.Affine2DBase`

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

*limits* is the view limit of the data. The only part of its bounds that is used is the *y* limits (for the radius limits). The *theta* range is handled by the non-affine transform.

`get_matrix()`

Get the Affine transformation array for the affine part of this transform.

```
class matplotlib.projections.polar.PolarAxes(*args, theta_offset=0, theta_direction=1,
                                             rlabel_position=22.5, **kwargs)
```

Bases: matplotlib.axes.\_axes.Axes

A polar graph projection, where the input dimensions are *theta*, *r*.

Theta starts pointing east and goes anti-clockwise.

Build an axes in a figure.

### Parameters

**fig** [*Figure*] The axes is build in the *Figure fig*.

**rect** [[left, bottom, width, height]] The axes is build in the rectangle *rect*.  
*rect* is in *Figure* coordinates.

**sharex, sharey** [*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

**frameon** [bool, optional] True means that the axes frame is visible.

**\*\*kwargs** Other optional keyword arguments:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (
<i>alpha</i>	float
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto', 'equal'} or num

## Returns

**axes** [*Axes*] The new *Axes* object.

```
class InvertedPolarTransform(axis=None, use_rmin=True, _ap-
                             ply_theta_transforms=True)
```

Bases: *matplotlib.transforms.Transform*

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

`input_dims = 2`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x === self.inverted().transform(self.transform(x))
```

`is_separable = False`

`output_dims = 2`

`transform_non_affine(xy)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`.

In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

```
class PolarAffine(scale_transform, limits)
```

```
    Bases: matplotlib.transforms.Affine2DBase
```

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

*limits* is the view limit of the data. The only part of its bounds that is used is the y limits (for the radius limits). The theta range is handled by the non-affine transform.

```
    get_matrix()
```

Get the Affine transformation array for the affine part of this transform.

```
class PolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)
```

```
    Bases: matplotlib.transforms.Transform
```

The base polar transform. This handles projection *theta* and *r* into Cartesian coordinate space *x* and *y*, but does not perform the ultimate affine transformation into the correct position.

```
    input_dims = 2
```

```
    inverted()
```

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
    x == self.inverted().transform(self.transform(x))
```

```
    is_separable = False
```

```
    output_dims = 2
```

```
    transform_non_affine(tr)
```

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`.

In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

```
    transform_path_non_affine(path)
```

Returns a path, transformed only by the non-affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

```
class RadialLocator(base, axes=None)
```

```
    Bases: matplotlib.ticker.Locator
```

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base *Locator* (which may be different depending on the scale of the *r*-axis).

```
    autoscale()
```

autoscale the view limits

`pan(numsteps)`  
Pan numticks (can be positive or negative)

`refresh()`  
refresh internal information based on current lim

`view_limits(vmin, vmax)`  
select a scale for the range from *vmin* to *vmax*  
Normally this method is overridden by subclasses to change locator behaviour.

`zoom(direction)`  
Zoom in/out on axis; if *direction* is  $>0$  zoom in, else zoom out

`class ThetaFormatter`  
Bases: `matplotlib.ticker.Formatter`  
Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

`class ThetaLocator(base)`  
Bases: `matplotlib.ticker.Locator`  
Used to locate theta ticks.  
This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

`autoscale()`  
autoscale the view limits

`pan(numsteps)`  
Pan numticks (can be positive or negative)

`refresh()`  
refresh internal information based on current lim

`set_axis(axis)`

`view_limits(vmin, vmax)`  
select a scale for the range from *vmin* to *vmax*  
Normally this method is overridden by subclasses to change locator behaviour.

`zoom(direction)`  
Zoom in/out on axis; if *direction* is  $>0$  zoom in, else zoom out

`can_pan()`  
Return *True* if this axes supports the pan/zoom button functionality.  
For polar axes, this is slightly misleading. Both panning and zooming are performed by the same button. Panning is performed in azimuth while zooming is done along the radial.

`can_zoom()`  
Return *True* if this axes supports the zoom box button functionality.  
Polar axes do not support zoom boxes.

`cla()`  
Clear the current axes.

`drag_pan(button, key, x, y)`  
Called when the mouse moves during a pan operation.

*button* is the mouse button number:

- 1: LEFT
- 2: MIDDLE
- 3: RIGHT

*key* is a "shift" key

*x*, *y* are the mouse coordinates in display coords.

---

**Note:** Intended to be overridden by new projection types.

---

`draw(*args, **kwargs)`

Draw everything (plot lines, axes, labels)

`end_pan()`

Called when a pan operation completes (when the mouse button is up.)

---

**Note:** Intended to be overridden by new projection types.

---

`format_coord(theta, r)`

Return a format string formatting the coordinate using Unicode characters.

`get_data_ratio()`

Return the aspect ratio of the data itself. For a polar plot, this should always be 1.0

`get_rlabel_position()`

**Returns**

**float** The theta position of the radius labels in degrees.

`get_rmax()`

`get_rmin()`

`get_rorigin()`

`get_theta_direction()`

Get the direction in which theta increases.

**-1:** Theta increases in the clockwise direction

**1:** Theta increases in the counterclockwise direction

`get_theta_offset()`

Get the offset for the location of 0 in radians.

`get_thetamax()`

`get_thetamin()`

`get_xaxis_text1_transform(pad)`

Get the transformation used for drawing x-axis labels, which will add the given amount of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates. Returns a 3-tuple of the form:

(transform, valign, halign)
-----------------------------

where *valign* and *halign* are requested alignments for the text.

---

**Note:** This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

`get_xaxis_text2_transform(pad)`

Get the transformation used for drawing the secondary x-axis labels, which will add the given amount of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates. Returns a 3-tuple of the form:

```
(transform, valign, halign)
```

where *valign* and *halign* are requested alignments for the text.

---

**Note:** This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

`get_xaxis_transform(which='grid')`

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

---

**Note:** This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

`get_yaxis_text1_transform(pad)`

Get the transformation used for drawing y-axis labels, which will add the given amount of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates. Returns a 3-tuple of the form:

```
(transform, valign, halign)
```

where *valign* and *halign* are requested alignments for the text.

---

**Note:** This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

`get_yaxis_text2_transform(pad)`

Get the transformation used for drawing the secondary y-axis labels, which will add the given amount of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates. Returns a 3-tuple of the form:

```
(transform, valign, halign)
```

where *valign* and *halign* are requested alignments for the text.

---

**Note:** This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

`get_yaxis_transform(which='grid')`

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

---

**Note:** This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

`name = 'polar'`

`set_rgrids(radii, labels=None, angle=None, fmt=None, **kwargs)`

Set the radial gridlines on a polar plot.

#### Parameters

**radii** [tuple with floats] The radii for the radial gridlines

**labels** [tuple with strings or None] The labels to use at each radial gridline. The *matplotlib.ticker.ScalarFormatter* will be used if None.

**angle** [float] The angular position of the radius labels in degrees.

**fmt** [str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'.

#### Returns

**lines, labels** [list of *lines.Line2D*, list of *text.Text*] *lines* are the radial gridlines and *labels* are the tick labels.

#### Other Parameters

**\*\*kwargs** *kwargs* are optional *Text* properties for the labels.

#### See also:

*PolarAxes.set\_thetagrids*, *Axis.get\_gridlines*, *Axis.get\_ticklabels*

`set_rlabel_position(value)`

Updates the theta position of the radius labels.

#### Parameters

**value** [number] The angular position of the radius labels in degrees.

`set_rlim(*args, **kwargs)`

`set_rmax(rmax)`

`set_rmin(rmin)`

`set_rorigin(rorigin)`

`set_rscale(*args, **kwargs)`

`set_rticks(*args, **kwargs)`

`set_theta_direction(direction)`

Set the direction in which theta increases.

**clockwise, -1:** Theta increases in the clockwise direction

**counterclockwise, anticlockwise, 1:** Theta increases in the counterclockwise direction

`set_theta_offset(offset)`

Set the offset for the location of 0 in radians.

`set_theta_zero_location(loc, offset=0.0)`

Sets the location of theta's zero. (Calls `set_theta_offset` with the correct value in radians under the hood.)

**loc** [str] May be one of "N", "NW", "W", "SW", "S", "SE", "E", or "NE".

**offset** [float, optional] An offset in degrees to apply from the specified `loc`. **Note:** this offset is *always* applied counter-clockwise regardless of the direction setting.

`set_theta grids(angles, labels=None, fmt=None, **kwargs)`

Set the theta gridlines in a polar plot.

#### Parameters

**angles** [tuple with floats, degrees] The angles of the theta gridlines.

**labels** [tuple with strings or None] The labels to use at each theta gridline. The `projections.polar.ThetaFormatter` will be used if None.

**fmt** [str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example '%f'. Note that the angle that is used is in radians.

#### Returns

**lines, labels** [list of `lines.Line2D`, list of `text.Text`] `lines` are the theta gridlines and `labels` are the tick labels.

#### Other Parameters

**\*\*kwargs** `kwargs` are optional `Text` properties for the labels.

#### See also:

`PolarAxes.set_rgrids`, `Axis.get_gridlines`, `Axis.get_ticklabels`

`set_theta lim(*args, **kwargs)`

`set_theta max(theta max)`

`set_theta min(theta min)`

`set_xscale(scale, *args, **kwargs)`

Set the x-axis scale.

#### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] scaling strategy to apply

#### See also:

`matplotlib.scale.LinearScale` linear transform

`matplotlib.scale.LogTransform` log transform  
`matplotlib.scale.SymmetricalLogTransform` symlog transform  
`matplotlib.scale.LogisticTransform` logit transform

### Notes

Different kwargs are accepted, depending on the scale. See the `scale` module for more information.

`set_yscale(*args, **kwargs)`  
Set the y-axis scale.

### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] scaling strategy to apply

### See also:

`matplotlib.scale.LinearScale` linear transform  
`matplotlib.scale.LogTransform` log transform  
`matplotlib.scale.SymmetricalLogTransform` symlog transform  
`matplotlib.scale.LogisticTransform` logit transform

### Notes

Different kwargs are accepted, depending on the scale. See the `scale` module for more information.

`start_pan(x, y, button)`  
Called when a pan operation has started.

`x`, `y` are the mouse coordinates in display coords. `button` is the mouse button number:

- 1: LEFT
- 2: MIDDLE
- 3: RIGHT

---

**Note:** Intended to be overridden by new projection types.

---

`class matplotlib.projections.polar.PolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)`

Bases: `matplotlib.transforms.Transform`

The base polar transform. This handles projection `theta` and `r` into Cartesian coordinate space `x` and `y`, but does not perform the ultimate affine transformation into the correct position.

`input_dims = 2`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

`is_separable = False`

`output_dims = 2`

`transform_non_affine(tr)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

`transform_path_non_affine(path)`

Returns a path, transformed only by the non-affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`class matplotlib.projections.polar.RadialAxis(*args, **kwargs)`

Bases: *matplotlib.axis.YAxis*

A radial Axis.

This overrides certain properties of a *YAxis* to provide special-casing for a radial axis.

`axis_name = 'radius'`

`cla()`

clear the current axis

`class matplotlib.projections.polar.RadialLocator(base, axes=None)`

Bases: *matplotlib.ticker.Locator*

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base *Locator* (which may be different depending on the scale of the *r*-axis).

`autoscale()`

autoscale the view limits

`pan(numsteps)`

Pan numticks (can be positive or negative)

`refresh()`

refresh internal information based on current lim

`view_limits(vmin, vmax)`

select a scale for the range from *vmin* to *vmax*

Normally this method is overridden by subclasses to change locator behaviour.

`zoom(direction)`

Zoom in/out on axis; if direction is >0 zoom in, else zoom out

```
class matplotlib.projections.polar.RadialTick(axes, loc, label, size=None,
                                              width=None, color=None, tick-
                                              dir=None, pad=None, label-
                                              size=None, labelcolor=None,
                                              zorder=None, gridOn=None,
                                              tick1On=True, tick2On=True, la-
                                              bel1On=True, label2On=False,
                                              major=True, labelrotation=0,
                                              grid_color=None, grid_linestyle=None,
                                              grid_linewidth=None,
                                              grid_alpha=None, **kw)
```

Bases: `matplotlib.axis.YTick`

A radial-axis tick.

This subclass of `YTick` provides radial ticks with some small modification to their re-positioning such that ticks are rotated based on axes limits. This results in ticks that are correctly perpendicular to the spine. Labels are also rotated to be perpendicular to the spine, when 'auto' rotation is enabled.

`bbox` is the `Bound2D` bounding box in display coords of the `Axes` `loc` is the tick location in data coords `size` is the tick size in points

`update_position(loc)`

Set the location of tick in data coords with scalar `loc`

```
class matplotlib.projections.polar.ThetaAxis(axes, pickradius=15)
```

Bases: `matplotlib.axis.XAxis`

A theta Axis.

This overrides certain properties of an `XAxis` to provide special-casing for an angular axis.

Init the axis with the parent `Axes` instance

```
axis_name = 'theta'
```

```
cla()
```

clear the current axis

```
class matplotlib.projections.polar.ThetaFormatter
```

Bases: `matplotlib.ticker.Formatter`

Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

```
class matplotlib.projections.polar.ThetaLocator(base)
```

Bases: `matplotlib.ticker.Locator`

Used to locate theta ticks.

This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

```
autoscale()
```

autoscale the view limits

`pan(numsteps)`  
 Pan numticks (can be positive or negative)

`refresh()`  
 refresh internal information based on current lim

`set_axis(axis)`

`view_limits(vmin, vmax)`  
 select a scale for the range from vmin to vmax

Normally this method is overridden by subclasses to change locator behaviour.

`zoom(direction)`  
 Zoom in/out on axis; if direction is >0 zoom in, else zoom out

`class matplotlib.projections.polar.ThetaTick(axes, *args, **kwargs)`

Bases: `matplotlib.axis.XTick`

A theta-axis tick.

This subclass of `XTick` provides angular ticks with some small modification to their re-positioning such that ticks are rotated based on tick location. This results in ticks that are correctly perpendicular to the arc spine.

When 'auto' rotation is enabled, labels are also rotated to be parallel to the spine. The label padding is also applied here since it's not possible to use a generic axes transform to produce tick-specific padding.

`update_position(loc)`

Set the location of tick in data coords with scalar `loc`

## 18.34 rcsetup

### 18.34.1 matplotlib.rcsetup

The `rcsetup` module contains the default values and the validation code for customization using matplotlib's rc settings.

Each rc setting is assigned a default value and a function used to validate any attempted changes to that setting. The default values and validation functions are defined in the `rcsetup` module, and are used to construct the `rcParams` global object which stores the settings and is referenced throughout matplotlib.

These default values should be consistent with the default `matplotlibrc` file that actually reflects the values given here. Any additions or deletions to the parameter set listed here should also be visited to the `matplotlibrc.template` in matplotlib's root source directory.

`class matplotlib.rcsetup.ValidateInStrings(key, valid, ignorecase=False)`

Bases: `object`

`valid` is a list of legal strings

`class matplotlib.rcsetup.ValidateInterval(vmin, vmax, closedmin=True, closedmax=True)`

Bases: `object`

Value must be in interval

`matplotlib.rcsetup.cycler(*args, **kwargs)`

Creates a `Cycler` object much like `cycler.cycler()`, but includes input validation.

Call signatures:

```
cycler(cycler)
cycler(label=values[, label2=values2[, ...]])
cycler(label, values)
```

Form 1 copies a given `Cycler` object.

Form 2 creates a `Cycler` which cycles over one or more properties simultaneously. If multiple properties are given, their value lists must have the same length.

Form 3 creates a `Cycler` for a single property. This form exists for compatibility with the original `cycler`. Its use is discouraged in favor of the kwarg form, i.e. `cycler(label=values)`.

### Parameters

**cycler** [`Cycler`] Copy constructor for `Cycler`.

**label** [`str`] The property key. Must be a valid `Artist` property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

**values** [`iterable`] Finite-length iterable of the property values. These values are validated and will raise a `ValueError` if invalid.

### Returns

**cycler** [`Cycler`] A new `Cycler` for the given properties.

### Examples

Creating a `cycler` for a single property:

```
>>> c = cycler(color=['red', 'green', 'blue'])
```

Creating a `cycler` for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```
>>> c = cycler(color=['red', 'green', 'blue'],
...            marker=['o', '+', 'x'])
```

`matplotlib.rcsetup.update_savefig_format(value)`

`matplotlib.rcsetup.validate_animation_writer_path(p)`

`matplotlib.rcsetup.validate_any(s)`

`matplotlib.rcsetup.validate_anylist(s)`

`matplotlib.rcsetup.validate_aspect(s)`

`matplotlib.rcsetup.validate_axisbelow(s)`

`matplotlib.rcsetup.validate_backend(s)`

`matplotlib.rcsetup.validate_bbox(s)`

---

`matplotlib.rcsetup.validate_bool(b)`  
Convert `b` to a boolean or raise

`matplotlib.rcsetup.validate_bool_maybe_none(b)`  
Convert `b` to a boolean or raise

`matplotlib.rcsetup.validate_capstylelist(s)`

`matplotlib.rcsetup.validate_color(s)`  
return a valid color arg

`matplotlib.rcsetup.validate_color_for_prop_cycle(s)`

`matplotlib.rcsetup.validate_color_or_auto(s)`

`matplotlib.rcsetup.validate_color_or_inherit(s)`  
return a valid color arg

`matplotlib.rcsetup.validate_colorlist(s)`  
return a list of colorspecs

`matplotlib.rcsetup.validate_cycler(s)`  
return a `Cycler` object from a string repr or the object itself

`matplotlib.rcsetup.validate_dashlist(s)`

`matplotlib.rcsetup.validate_dpi(s)`  
confirm `s` is string 'figure' or convert `s` to float or raise

`matplotlib.rcsetup.validate_fillstylelist(s)`

`matplotlib.rcsetup.validate_float(s)`  
convert `s` to float or raise

`matplotlib.rcsetup.validate_float_or_None(s)`  
convert `s` to float, `None` or raise

`matplotlib.rcsetup.validate_floatlist(s)`  
convert `s` to float or raise

`matplotlib.rcsetup.validate_font_properties(s)`

`matplotlib.rcsetup.validate_fontsize(s)`

`matplotlib.rcsetup.validate_fontsize_None(s)`

`matplotlib.rcsetup.validate_fontsizelist(s)`

`matplotlib.rcsetup.validate_fonttype(s)`  
confirm that this is a Postscript or PDF font type that we know how to convert to

`matplotlib.rcsetup.validate_hatch(s)`  
Validate a hatch pattern. A hatch pattern string can have any sequence of the following characters: `\ / | - + * . x o 0`.

`matplotlib.rcsetup.validate_hatchlist(s)`  
Validate a hatch pattern. A hatch pattern string can have any sequence of the following characters: `\ / | - + * . x o 0`.

`matplotlib.rcsetup.validate_hinting(s)`

`matplotlib.rcsetup.validate_hist_bins(s)`

`matplotlib.rcsetup.validate_int(s)`  
convert `s` to int or raise

`matplotlib.rcsetup.validate_int_or_None(s)`  
if not None, tries to validate as an int

`matplotlib.rcsetup.validate_joinstylelist(s)`

`matplotlib.rcsetup.validate_markevery(s)`  
Validate the markevery property of a Line2D object.

**Parameters**

**s** [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,  
list of ints

**Returns**

**s** [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,  
list of ints

`matplotlib.rcsetup.validate_markeverylist(s)`  
Validate the markevery property of a Line2D object.

**Parameters**

**s** [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,  
list of ints

**Returns**

**s** [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,  
list of ints

`class matplotlib.rcsetup.validate_nseq_float(n=None, allow_none=False)`

Bases: `object`

`class matplotlib.rcsetup.validate_nseq_int(n=None)`

Bases: `object`

`matplotlib.rcsetup.validate_path_exists(s)`  
If s is a path, return s, else False

`matplotlib.rcsetup.validate_ps_distiller(s)`

`matplotlib.rcsetup.validate_qt4(s)`

`matplotlib.rcsetup.validate_qt5(s)`

`matplotlib.rcsetup.validate_sketch(s)`

`matplotlib.rcsetup.validate_string(s)`

`matplotlib.rcsetup.validate_string_or_None(s)`  
convert s to string or raise

`matplotlib.rcsetup.validate_stringlist(s)`  
return a list

`matplotlib.rcsetup.validate_svg_fonttype(s)`

`matplotlib.rcsetup.validate_toolbar(s)`

`matplotlib.rcsetup.validate_webagg_address(s)`

`matplotlib.rcsetup.validate_whiskers(s)`

## 18.35 sankey

### 18.35.1 matplotlib.sankey

Module for creating Sankey diagrams using matplotlib

```
class matplotlib.sankey.Sankey(ax=None, scale=1.0, unit="", format='%G',
                               gap=0.25, radius=0.1, shoulder=0.03, offset=0.15,
                               head_angle=100, margin=0.4, tolerance=1e-06,
                               **kwargs)
```

Bases: `object`

Sankey diagram in matplotlib

Sankey diagrams are a specific type of flow diagram, in which the width of the arrows is shown proportionally to the flow quantity. They are typically used to visualize energy or material or cost transfers between processes. [Wikipedia \(6/1/2011\)](#)

Create a new Sankey instance.

Optional keyword arguments:

Field	Description
<i>ax</i>	axes onto which the data should be plotted If <i>ax</i> isn't provided, new axes will be created.
<i>scale</i>	scaling factor for the flows <i>scale</i> sizes the width of the paths in order to maintain proper layout. The same scale is applied to all subdiagrams. The value should be chosen such that the product of the scale and the sum of the inputs is approximately 1.0 (and the product of the scale and the sum of the outputs is approximately -1.0).
<i>unit</i>	string representing the physical unit associated with the flow quantities If <i>unit</i> is None, then none of the quantities are labeled.
<i>format</i>	a Python number formatting string to be used in labeling the flow as a quantity (i.e., a number times a unit, where the unit is given)
<i>gap</i>	space between paths that break in/break away to/from the top or bottom
<i>radius</i>	inner radius of the vertical paths
<i>shoulder</i>	size of the shoulders of output arrows
<i>offset</i>	text offset (from the dip or tip of the arrow)
<i>head_angle</i>	angle of the arrow heads (and negative of the angle of the tails) [deg]
<i>margin</i>	minimum space between Sankey outlines and the edge of the plot area
<i>tolerance</i>	acceptable maximum of the magnitude of the sum of flows The magnitude of the sum of connected flows cannot be greater than <i>tolerance</i> .

The optional arguments listed above are applied to all subdiagrams so that there is consistent alignment and formatting.

If *Sankey* is instantiated with any keyword arguments other than those explicitly listed above (**\*\*kwargs**), they will be passed to `add()`, which will create the first subdiagram.

In order to draw a complex Sankey diagram, create an instance of *Sankey* by calling it without any kwargs:

```
sankey = Sankey()
```

Then add simple Sankey sub-diagrams:

```
sankey.add() # 1
sankey.add() # 2
#...
sankey.add() # n
```

Finally, create the full diagram:

```
sankey.finish()
```

Or, instead, simply daisy-chain those calls:

```
Sankey().add().add... .add().finish()
```

### See also:

*add()* *finish()*

### Examples:

The default settings produce a diagram like this.

Flow Diagram of a Widget

```
add(patchlabel="", flows=None, orientations=None, labels="", trunklength=1.0,
    pathlengths=0.25, prior=None, connect=(0, 0), rotation=0, **kwargs)
```

Add a simple Sankey diagram with flows at the same hierarchical level.

Return value is the instance of *Sankey*.

Optional keyword arguments:

Two Systems

Key-word	Description
<i>patch-label</i>	label to be placed at the center of the diagram Note: <i>label</i> (not <i>patchlabel</i> ) will be passed to the patch through <b>**kwargs</b> and can be used to create an entry in the legend.
<i>flows</i>	array of flow values By convention, inputs are positive and outputs are negative.
<i>orientations</i>	list of orientations of the paths Valid values are 1 (from/to the top), 0 (from/to the left or right), or -1 (from/to the bottom). If <i>orientations</i> == 0, inputs will break in from the left and outputs will break away to the right.
<i>labels</i>	list of specifications of the labels for the flows Each value may be <i>None</i> (no labels), " (just label the quantities), or a labeling string. If a single value is provided, it will be applied to all flows. If an entry is a non-empty string, then the quantity for the corresponding flow will be shown below the string. However, if the <i>unit</i> of the main diagram is <i>None</i> , then quantities are never shown, regardless of the value of this argument.
<i>trunk-length</i>	length between the bases of the input and output groups
<i>pathlengths</i>	list of lengths of the arrows before break-in or after break-away If a single value is given, then it will be applied to the first (inside) paths on the top and bottom, and the length of all other arrows will be justified accordingly. The <i>pathlengths</i> are not applied to the horizontal inputs and outputs.
<i>prior</i>	index of the prior diagram to which this diagram should be connected
<i>connect</i>	a (prior, this) tuple indexing the flow of the prior diagram and the flow of this diagram which should be connected If this is the first diagram or <i>prior</i> is <i>None</i> , <i>connect</i> will be ignored.

Valid kwargs are `matplotlib.patches.PathPatch()` arguments:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>antialiased</code>	unknown
<code>capstyle</code>	{'butt', 'round', 'projecting'}
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<code>color</code>	color
<code>contains</code>	callable
<code>edgecolor</code>	color or None or 'auto'
<code>facecolor</code>	color or None
<code>figure</code>	<i>Figure</i>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	{'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code>	{'-', '--', '-.', ':', "", (offset, on-off-seq), ...}
<code>linewidth</code>	float or None for default
<code>path_effects</code>	<i>AbstractPathEffect</i>
<code>picker</code>	None or bool or float or callable
<code>rasterized</code>	bool or None
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<i>Transform</i>
<code>url</code>	str
<code>visible</code>	bool
<code>zorder</code>	float

As examples, `fill=False` and `label='A legend entry'`. By default, `facecolor='#bfd1d4'` (light blue) and `linewidth=0.5`.

The indexing parameters (*prior* and *connect*) are zero-based.

The flows are placed along the top of the diagram from the inside out in order of their index within the *flows* list or array. They are placed along the sides of the diagram from the top down and along the bottom from the outside in.

If the sum of the inputs and outputs is nonzero, the discrepancy will appear as a cubic Bezier curve along the top and bottom edges of the trunk.

#### See also:

`finish()`

`finish()`

Adjust the axes and return a list of information about the Sankey subdiagram(s).

Return value is a list of subdiagrams represented with the following fields:

Field	Description
<i>patch</i>	Sankey outline (an instance of <code>PathPatch</code> )
<i>flows</i>	values of the flows (positive for input, negative for output)
<i>angles</i>	list of angles of the arrows [deg/90] For example, if the diagram has not been rotated, an input to the top side will have an angle of 3 (DOWN), and an output from the top side will have an angle of 1 (UP). If a flow has been skipped (because its magnitude is less than <i>tolerance</i> ), then its angle will be <i>None</i> .
<i>tips</i>	array in which each row is an [x, y] pair indicating the positions of the tips (or "dips") of the flow paths If the magnitude of a flow is less the <i>tolerance</i> for the instance of <i>Sankey</i> , the flow is skipped and its tip will be at the center of the diagram.
<i>text</i>	<i>Text</i> instance for the label of the diagram
<i>texts</i>	list of <i>Text</i> instances for the labels of flows

## 18.36 scale

### 18.36.1 matplotlib.scale

```
class matplotlib.scale.InvertedLog10Transform(shorthand_name=None)
```

Bases: `matplotlib.scale.InvertedLogTransformBase`

Creates a new `TransformNode`.

**Parameters**

**`shorthand_name`** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`base = 10.0`

```
inverted()
```

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
class matplotlib.scale.InvertedLog2Transform(shorthand_name=None)
```

Bases: `matplotlib.scale.InvertedLogTransformBase`

Creates a new `TransformNode`.

**Parameters**

**`shorthand_name`** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`base = 2.0`

```
inverted()
```

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
class matplotlib.scale.InvertedLogTransform(base)
```

Bases: *matplotlib.scale.InvertedLogTransformBase*

```
inverted()
```

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
class matplotlib.scale.InvertedLogTransformBase(shorthand_name=None)
```

Bases: *matplotlib.transforms.Transform*

Creates a new TransformNode.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
has_inverse = True
```

```
input_dims = 1
```

```
is_separable = True
```

```
output_dims = 1
```

```
transform_non_affine(a)
```

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape  $(N \times \text{input\_dims})$  and returns a numpy array of shape  $(N \times \text{output\_dims})$ .

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

```
class matplotlib.scale.InvertedNaturalLogTransform(shorthand_name=None)
```

Bases: *matplotlib.scale.InvertedLogTransformBase*

Creates a new TransformNode.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
base = 2.718281828459045
```

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
class matplotlib.scale.InvertedSymmetricalLogTransform(base, linthresh, linscale)
```

Bases: `matplotlib.transforms.Transform`

`has_inverse = True`

`input_dims = 1`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

`is_separable = True`

`output_dims = 1`

`transform_non_affine(a)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape  $(N \times \text{input\_dims})$  and returns a numpy array of shape  $(N \times \text{output\_dims})$ .

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

```
class matplotlib.scale.LinearScale(axis, **kwargs)
```

Bases: `matplotlib.scale.ScaleBase`

The default linear scale.

`get_transform()`

The transform for linear scaling is just the `IdentityTransform`.

`name = 'linear'`

`set_default_locators_and_formatters(axis)`

Set the locators and formatters to reasonable defaults for linear scaling.

```
class matplotlib.scale.Log10Transform(nonpos='clip')
```

Bases: `matplotlib.scale.LogTransformBase`

`base = 10.0`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
class matplotlib.scale.Log2Transform(nonpos='clip')
```

Bases: *matplotlib.scale.LogTransformBase*

base = 2.0

inverted()

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
class matplotlib.scale.LogScale(axis, **kwargs)
```

Bases: *matplotlib.scale.ScaleBase*

A standard logarithmic scale. Care is taken so non-positive values are not plotted.

For computational efficiency (to push as much as possible to Numpy C code in the common cases), this scale provides different transforms depending on the base of the logarithm:

- base 10 (*Log10Transform*)
- base 2 (*Log2Transform*)
- base e (*NaturalLogTransform*)
- arbitrary base (*LogTransform*)

**basex/basey:** The base of the logarithm

**nonposx/nonposy: {'mask', 'clip'}** non-positive values in x or y can be masked as invalid, or clipped to a very small positive number

**subsx/subsy:** Where to place the subticks between each major tick. Should be a sequence of integers. For example, in a log10 scale: [2, 3, 4, 5, 6, 7, 8, 9]

will place 8 logarithmically spaced minor ticks between each major tick.

```
class InvertedLog10Transform(shorthand_name=None)
```

Bases: *matplotlib.scale.InvertedLogTransformBase*

Creates a new TransformNode.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

base = 10.0

inverted()

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
class InvertedLog2Transform(shorthand_name=None)
```

Bases: *matplotlib.scale.InvertedLogTransformBase*

Creates a new TransformNode.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`base = 2.0`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x == self.inverted().transform(self.transform(x))`

`class InvertedLogTransform(base)`

Bases: `matplotlib.scale.InvertedLogTransformBase`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x == self.inverted().transform(self.transform(x))`

`class InvertedNaturalLogTransform(shorthand_name=None)`

Bases: `matplotlib.scale.InvertedLogTransformBase`

Creates a new TransformNode.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`base = 2.718281828459045`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x == self.inverted().transform(self.transform(x))`

`class Log10Transform(nonpos='clip')`

Bases: `matplotlib.scale.LogTransformBase`

`base = 10.0`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x == self.inverted().transform(self.transform(x))`

`class Log2Transform(nonpos='clip')`

Bases: `matplotlib.scale.LogTransformBase`

`base = 2.0`

```

inverted()
    Return the corresponding inverse transformation.

    The return value of this method should be treated as temporary. An update to
    self does not cause a corresponding update to its inverted copy.

    x === self.inverted().transform(self.transform(x))

class LogTransform(base, nonpos='clip')
    Bases: matplotlib.scale.LogTransformBase

    inverted()
        Return the corresponding inverse transformation.

        The return value of this method should be treated as temporary. An update to
        self does not cause a corresponding update to its inverted copy.

        x === self.inverted().transform(self.transform(x))

class LogTransformBase(nonpos='clip')
    Bases: matplotlib.transforms.Transform

    has_inverse = True

    input_dims = 1

    is_separable = True

    output_dims = 1

    transform_non_affine(a)
        Performs only the non-affine part of the transformation.

        transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

        In non-affine transformations, this is generally equivalent to transform(values).
        In affine transformations, this is always a no-op.

        Accepts a numpy array of shape (N x input_dims) and returns a numpy array of
        shape (N x output_dims).

        Alternatively, accepts a numpy array of length input_dims and returns a numpy
        array of length output_dims.

class NaturalLogTransform(nonpos='clip')
    Bases: matplotlib.scale.LogTransformBase

    base = 2.718281828459045

    inverted()
        Return the corresponding inverse transformation.

        The return value of this method should be treated as temporary. An update to
        self does not cause a corresponding update to its inverted copy.

        x === self.inverted().transform(self.transform(x))

get_transform()
    Return a Transform instance appropriate for the given logarithm base.

limit_range_for_scale(vmin, vmax, minpos)
    Limit the domain to positive values.

name = 'log'

```

```
set_default_locators_and_formatters(axis)
```

Set the locators and formatters to specialized versions for log scaling.

```
class matplotlib.scale.LogTransform(base, nonpos='clip')
```

Bases: `matplotlib.scale.LogTransformBase`

```
inverted()
```

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
class matplotlib.scale.LogTransformBase(nonpos='clip')
```

Bases: `matplotlib.transforms.Transform`

```
has_inverse = True
```

```
input_dims = 1
```

```
is_separable = True
```

```
output_dims = 1
```

```
transform_non_affine(a)
```

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

```
class matplotlib.scale.LogisticTransform(nonpos='mask')
```

Bases: `matplotlib.transforms.Transform`

```
has_inverse = True
```

```
input_dims = 1
```

```
inverted()
```

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
is_separable = True
```

```
output_dims = 1
```

```
transform_non_affine(a)
```

logistic transform (base 10)

```
class matplotlib.scale.LogitScale(axis, nonpos='mask')
```

Bases: `matplotlib.scale.ScaleBase`

Logit scale for data between zero and one, both excluded.

This scale is similar to a log scale close to zero and to one, and almost linear around 0.5. It maps the interval ]0, 1[ onto ]-infty, +infty[.

**nonpos:** **{'mask', 'clip'}** values beyond ]0, 1[ can be masked as invalid, or clipped to a number very close to 0 or 1

`get_transform()`  
Return a *LogitTransform* instance.

`limit_range_for_scale(vmin, vmax, minpos)`  
Limit the domain to values between 0 and 1 (excluded).

`name = 'logit'`

`set_default_locators_and_formatters(axis)`  
Set the *Locator* and *Formatter* objects on the given axis to match this scale.

`class matplotlib.scale.LogitTransform(nonpos='mask')`

Bases: *matplotlib.transforms.Transform*

`has_inverse = True`

`input_dims = 1`

`inverted()`  
Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x == self.inverted().transform(self.transform(x))`

`is_separable = True`

`output_dims = 1`

`transform_non_affine(a)`  
logit transform (base 10), masked or clipped

`class matplotlib.scale.NaturalLogTransform(nonpos='clip')`

Bases: *matplotlib.scale.LogTransformBase*

`base = 2.718281828459045`

`inverted()`  
Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x == self.inverted().transform(self.transform(x))`

`class matplotlib.scale.ScaleBase`

Bases: *object*

The base class for all scales.

Scales are separable transformations, working on a single dimension.

Any subclasses will want to override:

- `name`
- `get_transform()`
- `set_default_locators_and_formatters()`

**And optionally:**

- `limit_range_for_scale()`

`get_transform()`

Return the *Transform* object associated with this scale.

`limit_range_for_scale(vmin, vmax, minpos)`

Returns the range *vmin*, *vmax*, possibly limited to the domain supported by this scale.

***minpos* should be the minimum positive value in the data.** This is used by log scales to determine a minimum value.

`set_default_locators_and_formatters(axis)`

Set the *Locator* and *Formatter* objects on the given axis to match this scale.

```
class matplotlib.scale.SymmetricalLogScale(axis, **kwargs)
```

Bases: `matplotlib.scale.ScaleBase`

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter *linthresh* allows the user to specify the size of this range (*-linthresh*, *linthresh*).

***basex/basey*:** The base of the logarithm

***linthreshx/linthreshy*:** A single float which defines the range (-*x*, *x*), within which the plot is linear. This avoids having the plot go to infinity around zero.

***subsx/subsy*:** Where to place the subticks between each major tick. Should be a sequence of integers. For example, in a log10 scale: [2, 3, 4, 5, 6, 7, 8, 9]

will place 8 logarithmically spaced minor ticks between each major tick.

***linscalex/linscaley*:** This allows the linear range (*-linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

```
class InvertedSymmetricalLogTransform(base, linthresh, linscale)
```

Bases: `matplotlib.transforms.Transform`

```
has_inverse = True
```

```
input_dims = 1
```

```
inverted()
```

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
is_separable = True
```

```
output_dims = 1
```

```
transform_non_affine(a)
```

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`.  
In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

```
class SymmetricalLogTransform(base, linthresh, linscale)
```

Bases: *matplotlib.transforms.Transform*

`has_inverse = True`

`input_dims = 1`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

`is_separable = True`

`output_dims = 1`

`transform_non_affine(a)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`.  
In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

`get_transform()`

Return a *SymmetricalLogTransform* instance.

`name = 'symlog'`

`set_default_locators_and_formatters(axis)`

Set the locators and formatters to specialized versions for symmetrical log scaling.

```
class matplotlib.scale.SymmetricalLogTransform(base, linthresh, linscale)
```

Bases: *matplotlib.transforms.Transform*

`has_inverse = True`

`input_dims = 1`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

```
is_separable = True
```

```
output_dims = 1
```

```
transform_non_affine(a)
```

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape  $(N \times \textit{input\_dims})$  and returns a numpy array of shape  $(N \times \textit{output\_dims})$ .

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

```
matplotlib.scale.get_scale_docs()
```

Helper function for generating docstrings related to scales.

```
matplotlib.scale.get_scale_names()
```

```
matplotlib.scale.register_scale(scale_class)
```

Register a new kind of scale.

*scale\_class* must be a subclass of *ScaleBase*.

```
matplotlib.scale.scale_factory(scale, axis, **kwargs)
```

Return a scale class by name.

ACCEPTS: [ linear | log | logit | symlog ]

## 18.37 spines

### 18.37.1 matplotlib.spines

```
class matplotlib.spines.Spine(axes, spine_type, path, **kwargs)
```

Bases: *matplotlib.patches.Patch*

an axis spine - the line noting the data area boundaries

Spines are the lines connecting the axis tick marks and noting the boundaries of the data area. They can be placed at arbitrary positions. See function:*set\_position* for more information.

The default position is ('outward', 0).

Spines are subclasses of class:*Patch*, and inherit much of their behavior.

Spines draw a line, a circle, or an arc depending if function:*set\_patch\_line*, function:*set\_patch\_circle*, or function:*set\_patch\_arc* has been called. Line-like is the default.

- *axes* : the Axes instance containing the spine
- *spine\_type* : a string specifying the spine type
- *path* : the path instance used to draw the spine

Valid kwargs are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`classmethod arc_spine(axes, spine_type, center, radius, theta1, theta2, **kwargs)  
(classmethod) Returns an arc Spine.`

`classmethod circular_spine(axes, center, radius, **kwargs)  
(staticmethod) Returns a circular Spine.`

`cla()`  
Clear the current spine

`draw(renderer)`  
Draw the *Patch* to the given *renderer*.

`get_bounds()`  
Get the bounds of the spine.

`get_patch_transform()`  
Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path()`  
Return the path of this patch

`get_position()`  
get the spine position

`get_smart_bounds()`  
get whether the spine has smart bounds

`get_spine_transform()`  
get the spine transform

`get_window_extent(renderer=None)`  
Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`is_frame_like()`  
return True if directly on axes frame

This is useful for determining if a spine is the edge of an old style MPL plot. If so, this function will return True.

`classmethod linear_spine(axes, spine_type, **kwargs)`  
(staticmethod) Returns a linear *Spine*.

`register_axis(axis)`  
register an axis

An axis should be registered with its corresponding spine from the Axes instance. This allows the spine to clear any axis properties when needed.

`set_bounds(low, high)`  
Set the bounds of the spine.

`set_color(c)`  
Set the edgecolor.

### Parameters

**c** [color or sequence of rgba tuples]

### .. seealso::

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

`set_patch_arc(center, radius, theta1, theta2)`  
set the spine to be arc-like

`set_patch_circle(center, radius)`  
set the spine to be circular

`set_patch_line()`  
set the spine to be linear

`set_position(position)`  
set the position of the spine

Spine position is specified by a 2 tuple of (position type, amount). The position types are:

- 'outward' : place the spine out from the data area by the specified number of points. (Negative values specify placing the spine inward.)
- 'axes' : place the spine at the specified Axes coordinate (from 0.0-1.0).
- 'data' : place the spine at the specified data coordinate.

Additionally, shorthand notations define a special positions:

- 'center' -> ('axes', 0.5)
- 'zero' -> ('data', 0.0)

`set_smart_bounds(value)`

set the spine and associated axis to have smart bounds

## 18.38 style

### 18.38.1 matplotlib.style

`matplotlib.style.context(style, after_reset=False)`

Context manager for using style settings temporarily.

#### Parameters

**style** [str, dict, or list] A style specification. Valid options are:

str	The name of a style or a path/URL to a style file. For a list of available style names, see <code>style.available</code> .
dict	Dictionary with valid key/value pairs for <code>matplotlib.rcParams</code> .
list	A list of style specifiers (str or dict) applied from first to last in the list.

**after\_reset** [bool] If True, apply style after resetting settings to their defaults; otherwise, apply style on top of the current settings.

`matplotlib.style.reload_library()`

Reload style library.

`matplotlib.style.use(style)`

Use matplotlib style settings from a style specification.

The style name of 'default' is reserved for reverting back to the default style settings.

#### Parameters

**style** [str, dict, or list] A style specification. Valid options are:

str	The name of a style or a path/URL to a style file. For a list of available style names, see <code>style.available</code> .
dict	Dictionary with valid key/value pairs for <code>matplotlib.rcParams</code> .
list	A list of style specifiers (str or dict) applied from first to last in the list.

`matplotlib.style.library`  
Dictionary of available styles

`matplotlib.style.available`  
List of available styles

## 18.39 table

### 18.39.1 `matplotlib.table`

Place a table below the x-axis at location `loc`.

The table consists of a grid of cells.

The grid need not be rectangular and can have holes.

Cells are added by specifying their row and column.

For the purposes of positioning the cell at (0, 0) is assumed to be at the top left and the cell at (`max_row`, `max_col`) is assumed to be at bottom right.

You can add additional cells outside this range to have convenient ways of positioning more interesting grids.

Author : John Gill <[jng@europe.renre.com](mailto:jng@europe.renre.com)> Copyright : 2004 John Gill and John Hunter  
License : matplotlib license

```
class matplotlib.table.Cell(xy, width, height, edgecolor='k', facecolor='w', fill=True,
                           text="", loc=None, fontproperties=None)
```

Bases: `matplotlib.patches.Rectangle`

A cell is a `Rectangle` with some associated text.

`PAD = 0.1`

`auto_set_font_size(renderer)`  
Shrink font size until text fits.

`draw(renderer)`  
Draw the Patch to the given `renderer`.

`get_fontsize()`  
Return the cell fontsize.

`get_required_width(renderer)`  
Get width required for this cell.

`get_text()`  
Return the cell `Text` instance.

`get_text_bounds(renderer)`  
Get text bounds in axes co-ordinates.

`set_figure(fig)`  
Set the `Figure` instance the artist belongs to.

#### Parameters

**fig** [`Figure`]

`set_fontsize(size)`

`set_text_props(**kwargs)`  
 update the text properties with kwargs

`set_transform(trans)`  
 Set the artist transform.

### Parameters

**t** [*Transform*]

`class matplotlib.table.CustomCell(*args, visible_edges, **kwargs)`  
 Bases: `matplotlib.table.Cell`

A subclass of Cell where the sides may be visibly toggled.

`get_path()`  
 Return a path where the edges specified by `_visible_edges` are drawn.

`visible_edges`

`class matplotlib.table.Table(ax, loc=None, bbox=None, **kwargs)`  
 Bases: `matplotlib.artist.Artist`

Create a table of cells.

Table can have (optional) row and column headers.

Each entry in the table can be either text or patches.

Column widths and row heights for the table can be specified.

Return value is a sequence of text, line and patch instances that make up the table

`AXESPAD = 0.02`

`FONTSIZE = 10`

`add_cell(row, col, *args, **kwargs)`  
 Add a cell to the table.

### Parameters

**row** [int] Row index.

**col** [int] Column index.

### Returns

**'CustomCell': Automatically created cell**

`auto_set_column_width(col)`  
 Given column indexes in either List, Tuple or int. Will be able to automatically set the columns into optimal sizes.

Here is the example of the input, which trigger automatic adjustment on columns to optimal size by given index numbers. -1: the row labling 0: the 1st column 1: the 2nd column

**Args:** `col(List): list of indexes >>>table.auto_set_column_width([-1,0,1])`

`col(Tuple): tuple of indexes >>>table.auto_set_column_width((-1,0,1))`

`col(int): index integer >>>table.auto_set_column_width(-1) >>>table.auto_set_column_width(0) >>>table.auto_set_column_width(1)`

`auto_set_font_size(value=True)`  
 Automatically set font size.

```

codes = {'best': 0, 'bottom': 17, 'bottom left': 12, 'bottom right': 13, 'center': 9, 'center left': 10, 'center right': 11, 'left': 14, 'right': 15, 'top': 16, 'top left': 18, 'top right': 19}
contains(mouseevent)
    Test whether the mouse event occurred in the table.
    Returns T/F, {}
draw(renderer)
    Derived classes drawing method
edges
get_cellid()
    Return a dict of cells in the table.
get_child_artists()
    Deprecated since version 3.0: The get_children function was deprecated in Matplotlib 3.0 and will be removed in 3.2.
    Return the Artists contained by the table.
get_children()
    Return the Artists contained by the table.
get_window_extent(renderer)
    Return the bounding box of the table in window coords.
scale(xscale, yscale)
    Scale column widths by xscale and row heights by yscale.
set_fontsize(size)
    Set the font size, in points, of the cell text.

```

### Parameters

**size** [float]

```

matplotlib.table.table(cellText=None, cellColours=None, cellLoc='right', colWidths=None, rowLabels=None, rowColours=None, rowLoc='left', colLabels=None, colColours=None, colLoc='center', loc='bottom', bbox=None, edges='closed')

```

Factory function to generate a Table instance.

Thanks to John Gill for providing the class and table.

## 18.40 text

### 18.40.1 matplotlib.text

Classes for including text in a figure.

```

class matplotlib.text.Annotation(s, xy, xytext=None, xycoords='data', textcoords=None, arrowprops=None, annotation_clip=None, **kwargs)

```

Bases: `matplotlib.text.Text`, `matplotlib.text._AnnotationBase`

Annotate the point *xy* with text *s*.

Additional kwargs are passed to `Text`.

### Parameters

- s** [str] The text of the annotation.
- xy** [iterable] Length 2 sequence specifying the (x,y) point to annotate.
- xytext** [iterable, optional] Length 2 sequence specifying the (x,y) to place the text at. If None, defaults to xy.
- xycoords** [str, Artist, Transform, callable or tuple, optional] The coordinate system that xy is given in.

For a `str` the allowed values are:

Property	Description
'figure points'	points from the lower left of the figure
'figure pixels'	pixels from the lower left of the figure
'figure fraction'	fraction of figure from lower left
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	fraction of axes from lower left
'data'	use the coordinate system of the object being annotated (default)
'polar'	$(\theta, r)$ if not native 'data' coordinates

If a `Artist` object is passed in the units are fraction if it's bounding box.

If a `Transform` object is passed in use that to transform xy to screen coordinates

If a callable it must take a `RendererBase` object as input and return a `Transform` or `Bbox` object

If a `tuple` must be length 2 tuple of str, Artist, Transform or callable objects. The first transform is used for the x coordinate and the second for y.

See [Advanced Annotation](#) for more details.

Defaults to 'data'

- textcoords** [str, Artist, Transform, callable or tuple, optional] The coordinate system that xytext is given, which may be different than the coordinate system used for xy.

All xycoords values are valid as well as the following strings:

Property	Description
'offset points'	offset (in points) from the xy value
'offset pixels'	offset (in pixels) from the xy value

defaults to the input of xycoords

- arrowprops** [dict, optional] If not None, properties used to draw a `FancyArrowPatch` arrow between xy and xytext.

If `arrowprops` does not contain the key `'arrowstyle'` the allowed keys are:

Key	Description
<code>width</code>	the width of the arrow in points
<code>headwidth</code>	the width of the base of the arrow head in points
<code>headlength</code>	the length of the arrow head in points
<code>shrink</code>	fraction of total length to 'shrink' from both ends
<code>?</code>	any key to <code>matplotlib.patches.FancyArrowPatch</code>

If the `arrowprops` contains the key `'arrowstyle'` the above keys are forbidden. The allowed values of `'arrowstyle'` are:

Name	Attrs
<code>'-'</code>	None
<code>'-&gt;'</code>	<code>head_length=0.4,head_width=0.2</code>
<code>'-['</code>	<code>widthB=1.0,lengthB=0.2,angleB=None</code>
<code>' -'</code>	<code>widthA=1.0,widthB=1.0</code>
<code>'- &gt;'</code>	<code>head_length=0.4,head_width=0.2</code>
<code>'&lt;-'</code>	<code>head_length=0.4,head_width=0.2</code>
<code>'&lt;-&gt;'</code>	<code>head_length=0.4,head_width=0.2</code>
<code>'&lt; -'</code>	<code>head_length=0.4,head_width=0.2</code>
<code>'&lt; -&gt;'</code>	<code>head_length=0.4,head_width=0.2</code>
<code>'fancy'</code>	<code>head_length=0.4,head_width=0.4,tail_width=0.4</code>
<code>'simple'</code>	<code>head_length=0.5,head_width=0.5,tail_width=0.2</code>
<code>'wedge'</code>	<code>tail_width=0.3,shrink_factor=0.5</code>

Valid keys for `FancyArrowPatch` are:

Key	Description
<code>arrowstyle</code>	the arrow style
<code>connectionstyle</code>	the connection style
<code>relpos</code>	default is (0.5, 0.5)
<code>patchA</code>	default is bounding box of the text
<code>patchB</code>	default is None
<code>shrinkA</code>	default is 2 points
<code>shrinkB</code>	default is 2 points
<code>mutation_scale</code>	default is text size (in points)
<code>mutation_aspect</code>	default is 1.
<code>?</code>	any key for <code>matplotlib.patches.PathPatch</code>

Defaults to None

**annotation\_clip** [bool, optional] Controls the visibility of the annotation when it goes outside the axes area.

If `True`, the annotation will only be drawn when the `xy` is inside the axes. If `False`, the annotation will always be drawn regardless of its position.

The default is `None`, which behave as `True` only if `xycoords` is "data".

## Returns

## Annotation

`anncoords`

`arrow`

Deprecated since version 3.0: The `<lambda>` function was deprecated in Matplotlib 3.0 and will be removed in 3.2.

`contains(event)`

Test whether the mouse event occurred in the patch.

In the case of text, a hit is true anywhere in the axis-aligned bounding-box containing the text.

## Returns

**bool** [bool]

`draw(renderer)`

Draw the *Annotation* object to the given *renderer*.

`get_window_extent(renderer=None)`

Return a *Bbox* object bounding the text and arrow annotation, in display units.

*renderer* defaults to the `_renderer` attribute of the text object. This is not assigned until the first execution of `draw()`, so you must use this kwarg if you want to call `get_window_extent()` prior to the first `draw()`. For getting web page regions, it is simpler to call the method after saving the figure. The *dpi* used defaults to `self.figure.dpi`; the *renderer dpi* is irrelevant.

`set_figure(fig)`

Set the *Figure* instance the artist belongs to.

## Parameters

**fig** [*Figure*]

`update_positions(renderer)`

Update the pixel positions of the annotated point and the text.

`xyann`

`class matplotlib.text.OffsetFrom(artist, ref_coord, unit='points')`

Bases: `object`

Callable helper class for working with *Annotation*

## Parameters

**artist** [Artist, BboxBase, or Transform] The object to compute the offset from.

**ref\_coord** [length 2 sequence] If *artist* is an Artist or BboxBase, this value is the location to of the offset origin in fractions of the *artist* bounding box.

If *artist* is a transform, the offset origin is the transform applied to this value.

**unit** [{'points', 'pixels'}] The screen units to use (pixels or points) for the offset input.

`get_unit()`

The unit for input to the transform used by `__call__`

`set_unit(unit)`

The unit for input to the transform used by `__call__`

**Parameters**

**unit** [{'points', 'pixels'}]

```
class matplotlib.text.Text(x=0, y=0, text="", color=None, verticalalign=
    'baseline', horizontalalignment='left', multialign-
    ment=None, fontproperties=None, rotation=None,
    linespacing=None, rotation_mode=None, usetex=None,
    wrap=False, **kwargs)
```

Bases: `matplotlib.artist.Artist`

Handle storing and drawing of text in window or data coordinates.

Create a `Text` instance at `x`, `y` with string `text`.

Valid kwargs are

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	float
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <code>patches.FancyBboxPatch</code>
<code>clip_box</code>	<code>matplotlib.transforms.Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	{ ( <code>path.Path</code> , <code>transforms.Transform</code> ), <code>patches.Patch</code> , None }
<code>color</code>	color
<code>contains</code>	callable
<code>figure</code>	<code>Figure</code>
<code>fontfamily</code>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontname</code>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontproperties</code>	<code>font_manager.FontProperties</code>
<code>fontsize</code>	{size in points, 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}
<code>fontstretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed'}
<code>fontstyle</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code>	{'normal', 'small-caps'}
<code>fontweight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'bold', 'extra-bold'}
<code>gid</code>	str
<code>horizontalalignment</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>multialignment</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or float or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool or None
<code>rotation</code>	{angle in degrees, 'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>text</code>	string or object castable to string (but None becomes '')

Property	Description
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>usetex</i>	bool or None
<i>verticalalignment</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

`contains(mouseevent)`

Test whether the mouse event occurred in the patch.

In the case of text, a hit is true anywhere in the axis-aligned bounding-box containing the text.

### Returns

**bool** [bool]

`draw(renderer)`

Draws the *Text* object to the given *renderer*.

`get_bbox_patch()`

Return the bbox Patch, or None if the *patches.FancyBboxPatch* is not made.

`get_color()`

Return the color of the text

`get_family(*args, **kwargs)`

alias for *get\_fontfamily*

`get_font_properties(*args, **kwargs)`

alias for *get\_fontproperties*

`get_fontfamily()`

Return the list of font families used for font lookup

### See also:

*font\_manager.FontProperties.get\_family*

`get_fontname()`

Return the font name as string

### See also:

*font\_manager.FontProperties.get\_name*

`get_fontproperties()`

Return the *font\_manager.FontProperties* object

`get_fontsize()`

Return the font size as integer

### See also:

*font\_manager.FontProperties.get\_size\_in\_points*

`get_fontstyle()`  
Return the font style as string  
**See also:**  
*font\_manager.FontProperties.get\_style*

`get_fontvariant()`  
Return the font variant as a string  
**See also:**  
*font\_manager.FontProperties.get\_variant*

`get_fontweight()`  
Get the font weight as string or number  
**See also:**  
*font\_manager.FontProperties.get\_weight*

`get_ha(*args, **kwargs)`  
alias for *get\_horizontalalignment*

`get_horizontalalignment()`  
Return the horizontal alignment as string. Will be one of 'left', 'center' or 'right'.

`get_name(*args, **kwargs)`  
alias for *get\_fontname*

`get_position()`  
Return the position of the text as a tuple (x, y)

`get_prop_tup(renderer=None)`  
Return a hashable tuple of properties.  
  
Not intended to be human readable, but useful for backends who want to cache derived information about text (e.g., layouts) and need to know if the text has changed.

`get_rotation()`  
Return the text angle as float in degrees.

`get_rotation_mode()`  
Get the text rotation mode.

`get_size(*args, **kwargs)`  
alias for *get\_fontsize*

`get_stretch()`  
Get the font stretch as a string or number  
**See also:**  
*font\_manager.FontProperties.get\_stretch*

`get_style(*args, **kwargs)`  
alias for *get\_fontstyle*

`get_text()`  
Get the text as string

`get_unitless_position()`  
Return the unitless position of the text as a tuple (x, y)

`get_usetex()`  
 Return whether this *Text* object uses TeX for rendering.  
 If the user has not manually set this value, it defaults to `rcParams["text.usetex"]`.

`get_va(*args, **kwargs)`  
 alias for `get_verticalalignment`

`get_variant(*args, **kwargs)`  
 alias for `get_fontvariant`

`get_verticalalignment()`  
 Return the vertical alignment as string. Will be one of 'top', 'center', 'bottom' or 'baseline'.

`get_weight(*args, **kwargs)`  
 alias for `get_fontweight`

`get_window_extent(renderer=None, dpi=None)`  
 Return a *Bbox* object bounding the text, in display units.  
 In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.  
*renderer* defaults to the `_renderer` attribute of the text object. This is not assigned until the first execution of `draw()`, so you must use this kwarg if you want to call `get_window_extent` prior to the first `draw`. For getting web page regions, it is simpler to call the method after saving the figure.  
*dpi* defaults to `self.figure.dpi`; the *renderer* dpi is irrelevant. For the web application, if `figure.dpi` is not the value used when saving the figure, then the value that was used must be specified as the *dpi* argument.

`get_wrap()`  
 Return the wrapping state for the text.

`static is_math_text(s, usetex=None)`  
 Returns a cleaned string and a boolean flag. The flag indicates if the given string *s* contains any mathtext, determined by counting unescaped dollar signs. If no mathtext is present, the cleaned string has its dollar signs unescaped. If *usetex* is on, the flag always has the value "TeX".

`set_backgroundcolor(color)`  
 Set the background color of the text by updating the *bbox*.

**Parameters****color** [color]**See also:**`set_bbox` To change the position of the bounding box

`set_bbox(rectprops)`  
 Draw a bounding box around self.

**Parameters**

**rectprops** [dict with properties for `patches.FancyBboxPatch`] The default boxstyle is 'square'. The mutation scale of the `patches.FancyBboxPatch` is set to the fontsize.

## Examples

```
t.set_bbox(dict(facecolor='red', alpha=0.5))
```

`set_clip_box(clipbox)`

Set the artist's clip *Bbox*.

### Parameters

**clipbox** [*matplotlib.transforms.Bbox*]

`set_clip_on(b)`

Set whether artist uses clipping.

When False, artists will be visible outside of the axes, which can lead to unexpected results.

### Parameters

**b** [bool]

`set_clip_path(path, transform=None)`

Set the artist's clip path, which may be:

- a *Patch* (or subclass) instance
- a **Path instance, in which case** an optional *Transform* instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

**ACCEPTS:** { (*path.Path*, *transforms.Transform*), *patches.Patch*, None }

`set_color(color)`

Set the foreground color of the text

### Parameters

**color** [color]

`set_family(*args, **kwargs)`

alias for *set\_fontfamily*

`set_font_properties(*args, **kwargs)`

alias for *set\_fontproperties*

`set_fontfamily(fontname)`

Set the font family. May be either a single string, or a list of strings in decreasing priority. Each string may be either a real font name or a generic font class name. If the latter, the specific font names will be looked up in the corresponding rcParams.

### Parameters

**fontname** [{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

### See also:

*font\_manager.FontProperties.set\_family*

`set_fontname(fontname)`  
alias for `set_family`

One-way alias only: the getter differs.

#### Parameters

**fontname** [{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

#### See also:

`font_manager.FontProperties.set_family`

`set_fontproperties(fp)`  
Set the font properties that control the text.

#### Parameters

**fp** [`font_manager.FontProperties`]

`set_fontsize(fontsize)`  
Set the font size. May be either a size string, relative to the default font size, or an absolute font size in points.

#### Parameters

**fontsize** [{size in points, 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}]

#### See also:

`font_manager.FontProperties.set_size`

`set_fontstretch(stretch)`  
Set the font stretch (horizontal condensation or expansion).

#### Parameters

**stretch** [{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'}]

#### See also:

`font_manager.FontProperties.set_stretch`

`set_fontstyle(fontstyle)`  
Set the font style.

#### Parameters

**fontstyle** [{'normal', 'italic', 'oblique'}]

#### See also:

`font_manager.FontProperties.set_style`

`set_fontvariant(variant)`  
Set the font variant, either 'normal' or 'small-caps'.

#### Parameters

**variant** [{'normal', 'small-caps'}]

#### See also:

`font_manager.FontProperties.set_variant`

`set_fontweight(weight)`  
Set the font weight.

**Parameters**

**weight** [{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'}]

**See also:**

*font\_manager.FontProperties.set\_weight*

`set_ha(*args, **kwargs)`  
alias for *set\_horizontalalignment*

`set_horizontalalignment(align)`  
Set the horizontal alignment to one of

**Parameters**

**align** [{'center', 'right', 'left'}]

`set_linespacing(spacing)`  
Set the line spacing as a multiple of the font size. Default is 1.2.

**Parameters**

**spacing** [float (multiple of font size)]

`set_ma(*args, **kwargs)`  
alias for *set\_multialignment*

`set_multialignment(align)`  
Set the alignment for multiple lines layout. The layout of the bounding box of all the lines is determined by the *horizontalalignment* and *verticalalignment* properties, but the multiline text within that box can be

**Parameters**

**align** [{'left', 'right', 'center'}]

`set_name(*args, **kwargs)`  
alias for *set\_fontname*

`set_position(xy)`  
Set the (x, y) position of the text.

**Parameters**

**xy** [(float, float)]

`set_rotation(s)`  
Set the rotation of the text.

**Parameters**

**s** [{angle in degrees, 'vertical', 'horizontal'}]

`set_rotation_mode(m)`  
Set text rotation mode.

**Parameters**

**m** [{None, 'default', 'anchor'}] If None or "default", the text will be first rotated, then aligned according to their horizontal and vertical alignments. If "anchor", then alignment occurs before rotation.

`set_size(*args, **kwargs)`  
alias for `set_fontsize`

`set_stretch(*args, **kwargs)`  
alias for `set_fontstretch`

`set_style(*args, **kwargs)`  
alias for `set_fontstyle`

`set_text(s)`  
Set the text string *s*.

It may contain newlines (`\n`) or math in LaTeX syntax.

#### Parameters

**s** [string or object castable to string (but None becomes '')]

`set_usetex(usetex)`

#### Parameters

**usetex** [bool or None] Whether to render using TeX, None means to use `rcParams["text.usetex"]`.

`set_va(*args, **kwargs)`  
alias for `set_verticalalignment`

`set_variant(*args, **kwargs)`  
alias for `set_fontvariant`

`set_verticalalignment(alignment)`  
Set the vertical alignment

#### Parameters

**alignment** [{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}]

`set_weight(*args, **kwargs)`  
alias for `set_fontweight`

`set_wrap(wrap)`  
Set the wrapping state for the text.

#### Parameters

**wrap** [bool]

`set_x(x)`  
Set the x position of the text.

#### Parameters

**x** [float]

`set_y(y)`  
Set the y position of the text.

#### Parameters

**y** [float]

`update(kwargs)`

Update properties from a dictionary.

`update_bbox_position_size(renderer)`

Update the location and the size of the bbox.

This method should be used when the position and size of the bbox needs to be updated before actually drawing the bbox.

`update_from(other)`

Copy properties from other to self.

`zorder = 3`

```
class matplotlib.text.TextWithDash(x=0, y=0, text="", color=None, verticalalign='center', horizontalalignment='center', multialignment=None, fontproperties=None, rotation=None, linespacing=None, dashlength=0.0, dashdirection=0, dashrotation=None, dashpad=3, dashpush=0)
```

Bases: `matplotlib.text.Text`

This is basically a `Text` with a dash (drawn with a `Line2D`) before/after it. It is intended to be a drop-in replacement for `Text`, and should behave identically to it when `dashlength = 0.0`.

The dash always comes between the point specified by `set_position()` and the text. When a dash exists, the text alignment arguments (`horizontalalignment`, `verticalalignment`) are ignored.

`dashlength` is the length of the dash in canvas units. (default = 0.0).

`dashdirection` is one of 0 or 1, where 0 draws the dash after the text and 1 before. (default = 0).

`dashrotation` specifies the rotation of the dash, and should generally stay `None`. In this case `get_dashrotation()` returns `get_rotation()`. (i.e., the dash takes its rotation from the text's rotation). Because the text center is projected onto the dash, major deviations in the rotation cause what may be considered visually unappealing results. (default = `None`)

`dashpad` is a padding length to add (or subtract) space between the text and the dash, in canvas units. (default = 3)

`dashpush` "pushes" the dash and text away from the point specified by `set_position()` by the amount in canvas units. (default = 0)

---

**Note:** The alignment of the two objects is based on the bounding box of the `Text`, as obtained by `get_window_extent()`. This, in turn, appears to depend on the font metrics as given by the rendering backend. Hence the quality of the "centering" of the label text with respect to the dash varies depending on the backend used.

---

---

**Note:** I'm not sure that I got the `get_window_extent()` right, or whether that's sufficient for providing the object bounding box.

---

`draw(renderer)`

Draw the `TextWithDash` object to the given `renderer`.

`get_dashdirection()`  
Get the direction dash. 1 is before the text and 0 is after.

`get_dashlength()`  
Get the length of the dash.

`get_dashpad()`  
Get the extra spacing between the dash and the text, in canvas units.

`get_dashpush()`  
Get the extra spacing between the dash and the specified text position, in canvas units.

`get_dashrotation()`  
Get the rotation of the dash in degrees.

`get_figure()`  
return the figure instance the artist belongs to

`get_position()`  
Return the position of the text as a tuple (x, y)

`get_prop_tup(renderer=None)`  
Return a hashable tuple of properties.

Not intended to be human readable, but useful for backends who want to cache derived information about text (e.g., layouts) and need to know if the text has changed.

`get_unitless_position()`  
Return the unitless position of the text as a tuple (x, y)

`get_window_extent(renderer=None)`  
Return a *Bbox* object bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

*renderer* defaults to the `_renderer` attribute of the text object. This is not assigned until the first execution of `draw()`, so you must use this kwarg if you want to call `get_window_extent()` prior to the first `draw()`. For getting web page regions, it is simpler to call the method after saving the figure.

`set_dashdirection(dd)`  
Set the direction of the dash following the text. 1 is before the text and 0 is after. The default is 0, which is what you'd want for the typical case of ticks below and on the left of the figure.

**Parameters****dd** [int (1 is before, 0 is after)]

`set_dashlength(dl)`  
Set the length of the dash, in canvas units.

**Parameters****dl** [float]

`set_dashpad(dp)`  
Set the "pad" of the `TextWithDash`, which is the extra spacing between the dash and the text, in canvas units.

**Parameters**

**dp** [float]

`set_dashpush(dp)`

Set the "push" of the `TextWithDash`, which is the extra spacing between the beginning of the dash and the specified position.

**Parameters**

**dp** [float]

`set_dashrotation(dr)`

Set the rotation of the dash, in degrees.

**Parameters**

**dr** [float]

`set_figure(fig)`

Set the figure instance the artist belongs to.

**Parameters**

**fig** [matplotlib.figure.Figure]

`set_position(xy)`

Set the (x, y) position of the `TextWithDash`.

**Parameters**

**xy** [(float, float)]

`set_transform(t)`

Set the `matplotlib.transforms.Transform` instance used by this artist.

**Parameters**

**t** [matplotlib.transforms.Transform]

`set_x(x)`

Set the x position of the `TextWithDash`.

**Parameters**

**x** [float]

`set_y(y)`

Set the y position of the `TextWithDash`.

**Parameters**

**y** [float]

`update_coords(renderer)`

Computes the actual x, y coordinates for text based on the input x, y and the `dash-length`. Since the rotation is with respect to the actual canvas's coordinates we need to map back and forth.

`matplotlib.text.get_rotation(rotation)`

Return the text angle as float between 0 and 360 degrees.

`rotation` may be 'horizontal', 'vertical', or a numeric value in degrees.

## 18.41 ticker

### 18.41.1 matplotlib.ticker

#### Tick locating and formatting

This module contains classes to support completely configurable tick locating and formatting. Although the locators know nothing about major or minor ticks, they are used by the Axis class to support major and minor tick locating and formatting. Generic tick locators and formatters are provided, as well as domain specific custom ones.

#### Default Formatter

The default formatter identifies when the x-data being plotted is a small range on top of a large offset. To reduce the chances that the ticklabels overlap the ticks are labeled as deltas from a fixed offset. For example:

```
ax.plot(np.arange(2000, 2010), range(10))
```

will have tick of 0-9 with an offset of +2e3. If this is not desired turn off the use of the offset on the default formatter:

```
ax.get_xaxis().get_major_formatter().set_useOffset(False)
```

set the rcParam `axes.formatter.useoffset=False` to turn it off globally, or set a different formatter.

#### Tick locating

The Locator class is the base class for all tick locators. The locators handle autoscaling of the view limits based on the data limits, and the choosing of tick locations. A useful semi-automatic tick locator is *MultipleLocator*. It is initialized with a base, e.g., 10, and it picks axis limits and ticks that are multiples of that base.

The Locator subclasses defined here are

*AutoLocator* *MaxNLocator* with simple defaults. This is the default tick locator for most plotting.

*MaxNLocator* Finds up to a max number of intervals with ticks at nice locations.

*LinearLocator* Space ticks evenly from min to max.

*LogLocator* Space ticks logarithmically from min to max.

*MultipleLocator* Ticks and range are a multiple of base; either integer or float.

*FixedLocator* Tick locations are fixed.

*IndexLocator* Locator for index plots (e.g., where  $x = \text{range}(\text{len}(y))$ ).

*NullLocator* No ticks.

*SymmetricalLogLocator* Locator for use with with the symlog norm; works like *LogLocator* for the part outside of the threshold and adds 0 if inside the limits.

*LogitLocator* Locator for logit scaling.

*OldAutoLocator* Choose a *MultipleLocator* and dynamically reassign it for intelligent ticking during navigation.

*AutoMinorLocator* Locator for minor ticks when the axis is linear and the major ticks are uniformly spaced. Subdivides the major tick interval into a specified number of minor intervals, defaulting to 4 or 5 depending on the major interval.

There are a number of locators specialized for date locations - see the `dates` module.

You can define your own locator by deriving from `Locator`. You must override the `__call__` method, which returns a sequence of locations, and you will probably want to override the `autoscale` method to set the view limits from the data limits.

If you want to override the default locator, use one of the above or a custom locator and pass it to the x or y axis instance. The relevant methods are:

```
ax.xaxis.set_major_locator(xmajor_locator)
ax.xaxis.set_minor_locator(xminor_locator)
ax.yaxis.set_major_locator(ymajor_locator)
ax.yaxis.set_minor_locator(yminor_locator)
```

The default minor locator is *NullLocator*, i.e., no minor ticks on by default.

### Tick formatting

Tick formatting is controlled by classes derived from `Formatter`. The formatter operates on a single tick value and returns a string to the axis.

*NullFormatter* No labels on the ticks.

*IndexFormatter* Set the strings from a list of labels.

*FixedFormatter* Set the strings manually for the labels.

*FuncFormatter* User defined function sets the labels.

*StrMethodFormatter* Use string `format` method.

*FormatStrFormatter* Use an old-style `sprintf` format string.

*ScalarFormatter* Default formatter for scalars: autopick the format string.

*LogFormatter* Formatter for log axes.

*LogFormatterExponent* Format values for log axis using `exponent = log_base(value)`.

*LogFormatterMathtext* Format values for log axis using `exponent = log_base(value)` using `Math` text.

*LogFormatterSciNotation* Format values for log axis using scientific notation.

*LogitFormatter* Probability formatter.

*EngFormatter* Format labels in engineering notation

*PercentFormatter* Format labels as a percentage

You can derive your own formatter from the `Formatter` base class by simply overriding the `__call__` method. The formatter class has access to the axis view and data limits.

To control the major and minor tick label formats, use one of the following methods:

```
ax.xaxis.set_major_formatter(xmajor_formatter)
ax.xaxis.set_minor_formatter(xminor_formatter)
ax.yaxis.set_major_formatter(ymajor_formatter)
ax.yaxis.set_minor_formatter(yminor_formatter)
```

See [/gallery/ticks\\_and\\_spines/major\\_minor\\_demo](#) for an example of setting major and minor ticks. See the `matplotlib.dates` module for more information and examples of using date locators and formatters.

```
class matplotlib.ticker.TickHelper
```

Bases: `object`

`axis = None`

`create_dummy_axis(**kwargs)`

`set_axis(axis)`

`set_bounds(vmin, vmax)`

`set_data_interval(vmin, vmax)`

`set_view_interval(vmin, vmax)`

```
class matplotlib.ticker.Formatter
```

Bases: `matplotlib.ticker.TickHelper`

Create a string based on a tick value and location.

`fix_minus(s)`

Some classes may want to replace a hyphen for minus with the proper unicode symbol (U+2212) for typographical correctness. The default is to not replace it.

Note, if you use this method, e.g., in `format_data()` or call, you probably don't want to use it for `format_data_short()` since the toolbar uses this for interactive coord reporting and I doubt we can expect GUIs across platforms will handle the unicode correctly. So for now the classes that override `fix_minus()` should have an explicit `format_data_short()` method

`format_data(value)`

Returns the full string representation of the value with the position unspecified.

`format_data_short(value)`

Return a short string version of the tick value.

Defaults to the position-independent long value.

`get_offset()`

`locs = []`

`set_locs(locs)`

```
class matplotlib.ticker.FixedFormatter(seq)
```

Bases: `matplotlib.ticker.Formatter`

Return fixed strings for tick labels based only on position, not value.

Set the sequence of strings that will be used for labels.

`get_offset()`

`set_offset_string(ofs)`

```
class matplotlib.ticker.NullFormatter
    Bases: matplotlib.ticker.Formatter
```

Always return the empty string.

```
class matplotlib.ticker.FuncFormatter(func)
    Bases: matplotlib.ticker.Formatter
```

Use a user-defined function for formatting.

The function should take in two inputs (a tick value  $x$  and a position  $pos$ ), and return a string containing the corresponding tick label.

```
class matplotlib.ticker.FormatStrFormatter(fmt)
    Bases: matplotlib.ticker.Formatter
```

Use an old-style ('%' operator) format string to format the tick.

The format string should have a single variable format (%) in it. It will be applied to the value (not the position) of the tick.

```
class matplotlib.ticker.StrMethodFormatter(fmt)
    Bases: matplotlib.ticker.Formatter
```

Use a new-style format string (as used by `str.format()`) to format the tick.

The field used for the value must be labeled  $x$  and the field used for the position must be labeled  $pos$ .

```
class matplotlib.ticker.ScalarFormatter(useOffset=None, useMathText=None, useLocale=None)
    Bases: matplotlib.ticker.Formatter
```

Format tick values as a number.

Tick value is interpreted as a plain old number. If `useOffset==True` and the data range is much smaller than the data average, then an offset will be determined such that the tick labels are meaningful. Scientific notation is used for data  $< 10^{-n}$  or data  $\geq 10^m$ , where  $n$  and  $m$  are the power limits set using `set_powerlimits((n,m))`. The defaults for these are controlled by the `axes.formatter.limits` RC parameter.

```
fix_minus(s)
    Replace hyphens with a unicode minus.
```

```
format_data(value)
    Return a formatted string representation of a number.
```

```
format_data_short(value)
    Return a short formatted string representation of a number.
```

```
get_offset()
    Return scientific notation, plus offset.
```

```
get_useLocale()
```

```
get_useMathText()
```

```
get_useOffset()
```

```
pprint_val(x)
```

```
set_locs(locs)
    Set the locations of the ticks.
```

```
set_powerlimits(lims)
    Sets size thresholds for scientific notation.
```

### Parameters

**lims** [(min\_exp, max\_exp)] A tuple containing the powers of 10 that determine the switchover threshold. Numbers below  $10^{\text{min\_exp}}$  and above  $10^{\text{max\_exp}}$  will be displayed in scientific notation.

For example, `formatter.set_powerlimits((-3, 4))` sets the pre-2007 default in which scientific notation is used for numbers less than  $1e^{-3}$  or greater than  $1e^4$ .

.. **seealso:: Method :meth:'set\_scientific'**

`set_scientific(b)`

Turn scientific notation on or off.

#### See also:

Method `set_powerlimits()`

`set_useLocale(val)`

`set_useMathText(val)`

`set_useOffset(val)`

`useLocale`

`useMathText`

`useOffset`

```
class matplotlib.ticker.LogFormatter(base=10.0, labelOnlyBase=False, mi-
                                   nor_thresholds=None, lenthresh=None)
```

Bases: `matplotlib.ticker.Formatter`

Base class for formatting ticks on a log or symlog scale.

It may be instantiated directly, or subclassed.

### Parameters

**base** [float, optional, default: 10.] Base of the logarithm used in all calculations.

**labelOnlyBase** [bool, optional, default: False] If True, label ticks only at integer powers of base. This is normally True for major ticks and False for minor ticks.

**minor\_thresholds** [(subset, all), optional, default: (1, 0.4)] If labelOnlyBase is False, these two numbers control the labeling of ticks that are not at integer powers of base; normally these are the minor ticks. The controlling parameter is the log of the axis data range. In the typical case where base is 10 it is the number of decades spanned by the axis, so we can call it 'numdec'. If `numdec <= all`, all minor ticks will be labeled. If `all < numdec <= subset`, then only a subset of minor ticks will be labeled, so as to avoid crowding. If `numdec > subset` then no minor ticks will be labeled.

**lenthresh** [None or float, optional, default: None] If a symmetric log scale is in use, its `lenthresh` parameter must be supplied here.

## Notes

The `set_locs` method must be called to enable the subsetting logic controlled by the `minor_thresholds` parameter.

In some cases such as the colorbar, there is no distinction between major and minor ticks; the tick locations might be set manually, or by a locator that puts ticks at integer powers of base and at intermediate locations. For this situation, disable the `minor_thresholds` logic by using `minor_thresholds=(np.inf, np.inf)`, so that all ticks will be labeled.

To disable labeling of minor ticks when 'labelOnlyBase' is False, use `minor_thresholds=(0, 0)`. This is the default for the "classic" style.

## Examples

To label a subset of minor ticks when the view limits span up to 2 decades, and all of the ticks when zoomed in to 0.5 decades or less, use `minor_thresholds=(2, 0.5)`.

To label all minor ticks when the view limits span up to 1.5 decades, use `minor_thresholds=(1.5, 1.5)`.

`base(base)`

Change the *base* for labeling.

**Warning:** Should always match the base used for *LogLocator*

`format_data(value)`

Returns the full string representation of the value with the position unspecified.

`format_data_short(value)`

Return a short formatted string representation of a number.

`label_minor(labelOnlyBase)`

Switch minor tick labeling on or off.

### Parameters

**labelOnlyBase** [bool] If True, label ticks only at integer powers of base.

`pprint_val(x, d)`

`set_locs(locs=None)`

Use axis view limits to control which ticks are labeled.

The *locs* parameter is ignored in the present algorithm.

`class matplotlib.ticker.LogFormatterExponent(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)`

Bases: `matplotlib.ticker.LogFormatter`

Format values for log axis using `exponent = log_base(value)`.

`class matplotlib.ticker.LogFormatterMathtext(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)`

Bases: `matplotlib.ticker.LogFormatter`

Format values for log axis using `exponent = log_base(value)`.

```
class matplotlib.ticker.IndexFormatter(labels)
```

```
    Bases: matplotlib.ticker.Formatter
```

Format the position  $x$  to the nearest  $i$ -th label where  $i=\text{int}(x+0.5)$

```
class matplotlib.ticker.LogFormatterSciNotation(base=10.0, labelOnlyBase=False,
                                                minor_thresholds=None,
                                                linthresh=None)
```

```
    Bases: matplotlib.ticker.LogFormatterMathtext
```

Format values following scientific notation in a logarithmic axis.

```
class matplotlib.ticker.LogitFormatter
```

```
    Bases: matplotlib.ticker.Formatter
```

Probability formatter (using Math text).

```
    format_data_short(value)
```

return a short formatted string representation of a number

```
class matplotlib.ticker.EngFormatter(unit="", places=None, sep=' ')
```

```
    Bases: matplotlib.ticker.Formatter
```

Formats axis values using engineering prefixes to represent powers of 1000, plus a specified unit, e.g., 10 MHz instead of  $1e7$ .

### Parameters

**unit** [str (default: "")] Unit symbol to use, suitable for use with single-letter representations of powers of 1000. For example, 'Hz' or 'm'.

**places** [int (default: None)] Precision with which to display the number, specified in digits after the decimal point (there will be between one and three digits before the decimal point). If it is None, the formatting falls back to the floating point format '%g', which displays up to 6 *significant* digits, i.e. the equivalent value for *places* varies between 0 and 5 (inclusive).

**sep** [str (default: " ")] Separator used between the value and the prefix/unit. For example, one get '3.14 mV' if *sep* is " " (default) and '3.14mV' if *sep* is "". Besides the default behavior, some other useful options may be:

- *sep*="" to append directly the prefix/unit to the value;
- *sep*="\N{THIN SPACE}" (U+2009);
- *sep*="\N{NARROW NO-BREAK SPACE}" (U+202F);
- *sep*="\N{NO-BREAK SPACE}" (U+00A0).

```
ENG_PREFIXES = {-24: 'y', -21: 'z', -18: 'a', -15: 'f', -12: 'p', -9: 'n', -6: 'μ', -3: 'm', 0:
```

```
format_eng(num)
```

Formats a number in engineering notation, appending a letter representing the power of 1000 of the original number. Some examples:

```
>>> format_eng(0)           # for self.places = 0
'0'
```

```
>>> format_eng(1000000) # for self.places = 1
'1.0 M'
```

```
>>> format_eng("-1e-6") # for self.places = 2
'-1.00 μ'
```

```
class matplotlib.ticker.PercentFormatter(xmax=100, decimals=None, symbol='%',
                                         is_latex=False)
```

Bases: `matplotlib.ticker.Formatter`

Format numbers as a percentage.

### Parameters

**xmax** [float] Determines how the number is converted into a percentage. *xmax* is the data value that corresponds to 100%. Percentages are computed as  $x / xmax * 100$ . So if the data is already scaled to be percentages, *xmax* will be 100. Another common situation is where *xmax* is 1.0.

**decimals** [None or int] The number of decimal places to place after the point. If *None* (the default), the number will be computed automatically.

**symbol** [string or None] A string that will be appended to the label. It may be *None* or empty to indicate that no symbol should be used. LaTeX special characters are escaped in *symbol* whenever latex mode is enabled, unless *is\_latex* is *True*.

**is\_latex** [bool] If *False*, reserved LaTeX characters in *symbol* will be escaped.

`convert_to_pct(x)`

`format_pct(x, display_range)`

Formats the number as a percentage number with the correct number of decimals and adds the percent symbol, if any.

If `self.decimals` is *None*, the number of digits after the decimal point is set based on the `display_range` of the axis as follows:

display_range	decimals	sample
>50	0	x = 34.5 => 35%
>5	1	x = 34.5 => 34.5%
>0.5	2	x = 34.5 => 34.50%
...	...	...

This method will not be very good for tiny axis ranges or extremely large ones. It assumes that the values on the chart are percentages displayed on a reasonable scale.

**symbol**

The configured percent symbol as a string.

If LaTeX is enabled via `rcParams["text.usetex"]`, the special characters `{'#, '$', '%', '&', '~', '_', '^', '\\', '{', '}'` are automatically escaped in the string.

```
class matplotlib.ticker.Locator
```

Bases: `matplotlib.ticker.TickHelper`

Determine the tick locations;

Note, you should not use the same locator between different *Axis* because the locator stores references to the Axis data and view limits

`MAXTICKS = 1000`

`autoscale()`  
autoscale the view limits

`pan(numsteps)`  
Pan numticks (can be positive or negative)

`raise_if_exceeds(locs)`  
raise a `RuntimeError` if Locator attempts to create more than `MAXTICKS` locs

`refresh()`  
refresh internal information based on current lim

`set_params(**kwargs)`  
Do nothing, and raise a warning. Any locator class not supporting the `set_params()` function will call this.

`tick_values(vmin, vmax)`  
Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`view_limits(vmin, vmax)`  
select a scale for the range from `vmin` to `vmax`

Normally this method is overridden by subclasses to change locator behaviour.

`zoom(direction)`  
Zoom in/out on axis; if `direction` is `>0` zoom in, else zoom out

`class matplotlib.ticker.IndexLocator(base, offset)`  
Bases: `matplotlib.ticker.Locator`

Place a tick on every multiple of some base number of points plotted, e.g., on every 5th point. It is assumed that you are doing index plotting; i.e., the axis is 0, `len(data)`. This is mainly useful for x ticks.

place ticks on the `i`-th data points where  $(i - \text{offset}) \% \text{base} == 0$

`set_params(base=None, offset=None)`  
Set parameters within this locator

`tick_values(vmin, vmax)`  
Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```
class matplotlib.ticker.FixedLocator(locs, nbins=None)
```

Bases: *matplotlib.ticker.Locator*

Tick locations are fixed. If *nbins* is not *None*, the array of possible positions will be subsampled to keep the number of ticks  $\leq$  *nbins* + 1. The subsampling will be done so as to include the smallest absolute value; for example, if zero is included in the array of possibilities, then it is guaranteed to be one of the chosen ticks.

```
set_params(nbins=None)
```

Set parameters within this locator.

```
tick_values(vmin, vmax)
```

Return the locations of the ticks.

---

**Note:** Because the values are fixed, *vmin* and *vmax* are not used in this method.

---

```
class matplotlib.ticker.NullLocator
```

Bases: *matplotlib.ticker.Locator*

No ticks

```
tick_values(vmin, vmax)
```

Return the locations of the ticks.

---

**Note:** Because the values are *Null*, *vmin* and *vmax* are not used in this method.

---

```
class matplotlib.ticker.LinearLocator(numticks=None, presets=None)
```

Bases: *matplotlib.ticker.Locator*

Determine the tick locations

The first time this function is called it will try to set the number of ticks to make a nice tick partitioning. Thereafter the number of ticks will be fixed so that interactive navigation will be nice

Use presets to set *locs* based on *lom*. A dict mapping *vmin*, *vmax*->*locs*

```
set_params(numticks=None, presets=None)
```

Set parameters within this locator.

```
tick_values(vmin, vmax)
```

Return the values of the located ticks given ***vmin*** and ***vmax***.

---

**Note:** To get tick locations with the *vmin* and *vmax* values defined automatically for the associated axis simply call the *Locator* instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits(vmin, vmax)`

Try to choose the view limits intelligently

```
class matplotlib.ticker.LogLocator(base=10.0, subs=(1.0, ), numdecs=4,
                                  numticks=None)
```

Bases: `matplotlib.ticker.Locator`

Determine the tick locations for log axes

Place ticks on the locations : `subs[j] * base**i`

### Parameters

**subs** [None, string, or sequence of float, optional, default (1.0,)] Gives the multiples of integer powers of the base at which to place ticks. The default places ticks only at integer powers of the base. The permitted string values are 'auto' and 'all', both of which use an algorithm based on the axis view limits to determine whether and how to put ticks between integer powers of the base. With 'auto', ticks are placed only between integer powers; with 'all', the integer powers are included. A value of None is equivalent to 'auto'.

`base(base)`

set the base of the log scaling (major tick every `base**i`, `i` integer)

`nonsingular(vmin, vmax)`

`set_params(base=None, subs=None, numdecs=None, numticks=None)`

Set parameters within this locator.

`subs(subs)`

set the minor ticks for the log scaling every `base**i*subs[j]`

`tick_values(vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the `Locator` instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits(vmin, vmax)`

Try to choose the view limits intelligently

```
class matplotlib.ticker.AutoLocator
```

Bases: `matplotlib.ticker.MaxNLocator`

Dynamically find major tick positions. This is actually a subclass of `MaxNLocator`, with parameters `nbins = 'auto'` and `steps = [1, 2, 2.5, 5, 10]`.

To know the values of the non-public parameters, please have a look to the defaults of `MaxNLocator`.

```
class matplotlib.ticker.MultipleLocator(base=1.0)
```

Bases: `matplotlib.ticker.Locator`

Set a tick on each integer multiple of a base within the view interval.

`set_params(base)`

Set parameters within this locator.

`tick_values(vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`view_limits(dmin, dmax)`

Set the view limits to the nearest multiples of base that contain the data.

`class matplotlib.ticker.MaxNLocator(*args, **kwargs)`

Bases: `matplotlib.ticker.Locator`

Select no more than N intervals at nice locations.

Keyword args:

**nbins** Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

**steps** Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

**integer** If True, ticks will take only integer values, provided at least `min_n_ticks` integers are found within the view limits.

**symmetric** If True, autoscaling will result in a range symmetric about zero.

**prune** ['lower' | 'upper' | 'both' | None] Remove edge ticks - useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when `rcParams["axes.autolimit_mode"]` is 'round\_numbers'. If `prune=='lower'`, the smallest tick will be removed. If `prune == 'upper'`, the largest tick will be removed. If `prune == 'both'`, the largest and smallest ticks will be removed. If `prune == None`, no ticks will be removed.

**min\_n\_ticks** Relax `nbins` and `integer` constraints if necessary to obtain this minimum number of ticks.

`default_params = {'integer': False, 'min_n_ticks': 2, 'nbins': 10, 'prune': None, 'steps': None,`

`set_params(**kwargs)`

Set parameters within this locator.

`tick_values(vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`view_limits(dmin, dmax)`

select a scale for the range from `vmin` to `vmax`

Normally this method is overridden by subclasses to change locator behaviour.

`class matplotlib.ticker.AutoMinorLocator(n=None)`

Bases: `matplotlib.ticker.Locator`

Dynamically find minor tick positions based on the positions of major ticks. The scale must be linear with major ticks evenly spaced.

`n` is the number of subdivisions of the interval between major ticks; e.g., `n=2` will place a single minor tick midway between major ticks.

If `n` is omitted or `None`, it will be set to 5 or 4.

`tick_values(vmin, vmax)`

Return the values of the located ticks given **`vmin`** and **`vmax`**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`class matplotlib.ticker.SymmetricalLogLocator(transform=None, subs=None, linthresh=None, base=None)`

Bases: `matplotlib.ticker.Locator`

Determine the tick locations for symmetric log axes

place ticks on the location= `base**i*subs[j]`

`set_params(subs=None, numticks=None)`

Set parameters within this locator.

`tick_values(vmin, vmax)`

Return the values of the located ticks given **`vmin`** and **`vmax`**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`view_limits(vmin, vmax)`

Try to choose the view limits intelligently

`class matplotlib.ticker.LogitLocator(minor=False)`

Bases: `matplotlib.ticker.Locator`

Determine the tick locations for logit axes

place ticks on the logit locations

`nonsingular(vmin, vmax)`

`set_params(minor=None)`

Set parameters within this locator.

`tick_values(vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the `Locator` instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

## 18.42 tight\_layout

### 18.42.1 matplotlib.tight\_layout

This module provides routines to adjust subplot params so that subplots are nicely fit in the figure. In doing so, only axis labels, tick labels, axes titles and offsetboxes that are anchored to axes are currently considered.

Internally, it assumes that the margins (`left_margin`, etc.) which are differences between `ax.get_tightbbox` and `ax.bbox` are independent of axes position. This may fail if `Axes.adjustable` is `datalim`. Also, This will fail for some cases (for example, left or right margin is affected by `xlabel`).

```
matplotlib.tight_layout.auto_adjust_subplotpars(fig, renderer, nrows_ncols,
                                                num1num2_list, subplot_list,
                                                ax_bbox_list=None, pad=1.08,
                                                h_pad=None, w_pad=None,
                                                rect=None)
```

Return a dict of subplot parameters to adjust spacing between subplots.

Note that this function ignores geometry information of subplot itself, but uses what is given by the `nrows_ncols` and `num1num2_list` parameters. Also, the results could be incorrect if some subplots have `adjustable=datalim`.

#### Parameters

**nrows\_ncols** [Tuple[int, int]] Number of rows and number of columns of the grid.

**num1num2\_list** [List[int]] List of numbers specifying the area occupied by the subplot

**subplot\_list** [list of subplots] List of subplots that will be used to calculate optimal subplot\_params.

**pad** [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h\_pad, w\_pad** [float] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to *pad*.

**rect** [Tuple[float, float, float, float]] [left, bottom, right, top] in normalized (0, 1) figure coordinates.

`matplotlib.tight_layout.get_renderer(fig)`

`matplotlib.tight_layout.get_subplotspec_list(axes_list, grid_spec=None)`  
Return a list of subplotspec from the given list of axes.

For an instance of axes that does not support subplotspec, None is inserted in the list.

If grid\_spec is given, None is inserted for those not from the given grid\_spec.

`matplotlib.tight_layout.get_tight_layout_figure(fig, axes_list, subplotspec_list, renderer, pad=1.08, h_pad=None, w_pad=None, rect=None)`

Return subplot parameters for tight-laid-out-figure with specified padding.

#### Parameters

**fig** [Figure]

**axes\_list** [list of Axes]

**subplotspec\_list** [list of *SubplotSpec*] The subplotspecs of each axes.

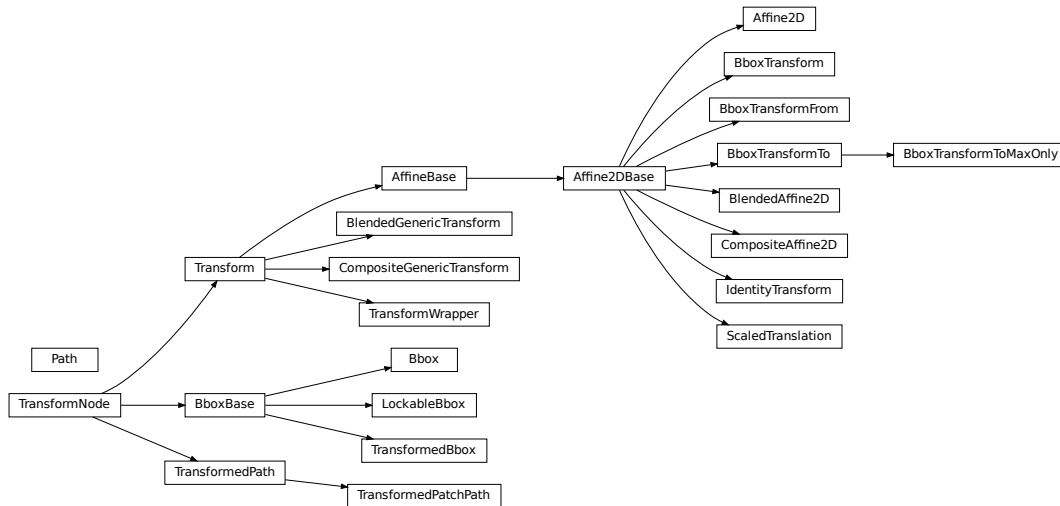

**renderer** [renderer]

**pad** [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h\_pad, w\_pad** [float] Padding (height/width) between edges of adjacent subplots. Defaults to *pad\_inches*.

**rect** [Tuple[float, float, float, float], optional] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Defaults to using the entire figure.

## 18.43 transformations

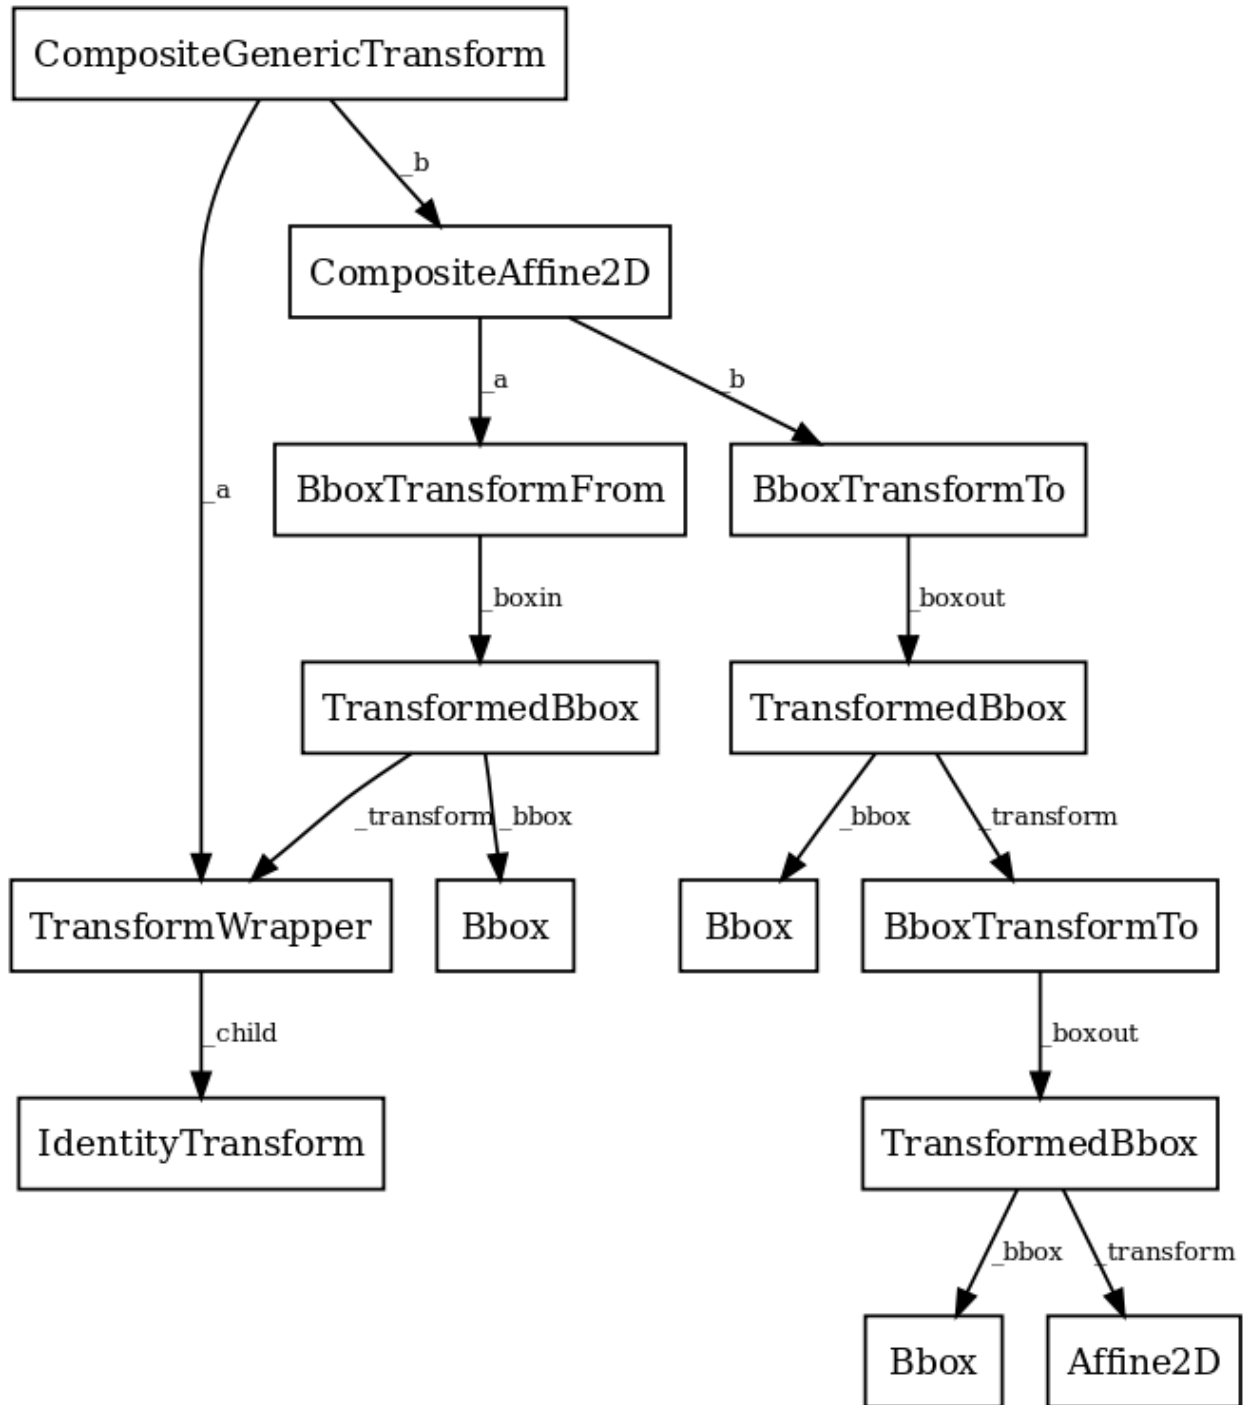

### 18.43.1 matplotlib.transforms

matplotlib includes a framework for arbitrary geometric transformations that is used to determine the final position of all elements drawn on the canvas.

Transforms are composed into trees of *TransformNode* objects whose actual value depends on their children. When the contents of children change, their parents are automatically invalidated. The next time an invalidated transform is accessed, it is recomputed to reflect those changes. This invalidation/caching approach prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

For example, here is a graph of the transform tree used to plot data to the graph:

The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

```
full transform == non-affine part + affine part
```

The backends are not expected to handle non-affine transformations themselves.

```
class matplotlib.transforms.Affine2D(matrix=None, **kwargs)
```

Bases: `matplotlib.transforms.Affine2DBase`

A mutable 2D affine transformation.

Initialize an Affine transform from a 3x3 numpy float array:

```
a c e
b d f
0 0 1
```

If `matrix` is `None`, initialize with the identity transform.

`clear()`

Reset the underlying matrix to the identity transform.

`static from_values(a, b, c, d, e, f)`

(staticmethod) Create a new `Affine2D` instance from the given values:

```
a c e
b d f
0 0 1
```

`get_matrix()`

Get the underlying transformation matrix as a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

`static identity()`

(staticmethod) Return a new `Affine2D` object that is the identity transform.

Unless this transform will be mutated later on, consider using the faster `IdentityTransform` class instead.

`is_separable`

`rotate(theta)`

Add a rotation (in radians) to this transform in place.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`rotate_around(x, y, theta)`

Add a rotation (in radians) around the point (x, y) in place.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`rotate_deg(degrees)`

Add a rotation (in degrees) to this transform in place.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`rotate_deg_around(x, y, degrees)`

Add a rotation (in degrees) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`scale(sx, sy=None)`

Adds a scale in place.

If `sy` is `None`, the same scale is applied in both the `x`- and `y`-directions.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`set(other)`

Set this transformation from the frozen copy of another `Affine2DBase` object.

`set_matrix(mtx)`

Set the underlying transformation matrix from a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

.

`skew(xShear, yShear)`

Adds a skew in place.

`xShear` and `yShear` are the shear angles along the `x`- and `y`-axes, respectively, in radians.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`skew_deg(xShear, yShear)`

Adds a skew in place.

`xShear` and `yShear` are the shear angles along the `x`- and `y`-axes, respectively, in degrees.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`translate(tx, ty)`

Adds a translation in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`class matplotlib.transforms.Affine2DBase(*args, **kwargs)`

Bases: `matplotlib.transforms.AffineBase`

The base class of all 2D affine transformations.

2D affine transformations are performed using a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

This class provides the read-only interface. For a mutable 2D affine transformation, use `Affine2D`.

Subclasses of this class will generally only need to override a constructor and `get_matrix()` that generates a custom 3x3 matrix.

`frozen()`

Returns a frozen copy of this transform node. The frozen copy will not update when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`has_inverse = True`

`input_dims = 2`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x == self.inverted().transform(self.transform(x))`

`is_separable`

`static matrix_from_values(a, b, c, d, e, f)`

(staticmethod) Create a new transformation matrix as a 3x3 numpy array of the form:

```
a c e
b d f
0 0 1
```

`output_dims = 2`

`to_values()`

Return the values of the matrix as a sequence (a,b,c,d,e,f)

`transform_affine(points)`

Performs only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

`transform_point(point)`

A convenience function that returns the transformed copy of a single point.

The point is given as a sequence of length *input\_dims*. The transformed point is returned as a sequence of length *output\_dims*.

`class matplotlib.transforms.AffineBase(*args, **kwargs)`

Bases: `matplotlib.transforms.Transform`

The base class of all affine transformations of any number of dimensions.

`get_affine()`

Get the affine part of this transform.

`is_affine = True`

`transform(values)`

Performs the transformation on the given array of values.

Accepts a numpy array of shape (N x input\_dims) and returns a numpy array of shape (N x output\_dims).

Alternatively, accepts a numpy array of length input\_dims and returns a numpy array of length output\_dims.

`transform_affine(values)`

Performs only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Accepts a numpy array of shape (N x input\_dims) and returns a numpy array of shape (N x output\_dims).

Alternatively, accepts a numpy array of length input\_dims and returns a numpy array of length output\_dims.

`transform_non_affine(points)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input\_dims) and returns a numpy array of shape (N x output\_dims).

Alternatively, accepts a numpy array of length input\_dims and returns a numpy array of length output\_dims.

`transform_path(path)`

Returns a transformed path.

*path*: a *Path* instance.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine(path)`

Returns a path, transformed only by the affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_path_non_affine(path)`

Returns a path, transformed only by the non-affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

```
class matplotlib.transforms.Bbox(points, **kwargs)
```

Bases: *matplotlib.transforms.BboxBase*

A mutable bounding box.

### Parameters

**points** [ndarray] A 2x2 numpy array of the form `[[x0, y0], [x1, y1]]`.

## Notes

If you need to create a *Bbox* object from another form of data, consider the static methods *unit()*, *from\_bounds()* and *from\_extents()*.

### **bounds**

Returns (*x0*, *y0*, *width*, *height*).

### **static from\_bounds(*x0*, *y0*, *width*, *height*)**

(staticmethod) Create a new *Bbox* from *x0*, *y0*, *width* and *height*.

*width* and *height* may be negative.

### **static from\_extents(\**args*)**

(staticmethod) Create a new *Bbox* from *left*, *bottom*, *right* and *top*.

The y-axis increases upwards.

### **get\_points()**

Get the points of the bounding box directly as a numpy array of the form: `[[x0, y0], [x1, y1]]`.

### **ignore(*value*)**

Set whether the existing bounds of the box should be ignored by subsequent calls to *update\_from\_data\_xy()*.

### **value [bool]**

- When True, subsequent calls to *update\_from\_data\_xy()* will ignore the existing bounds of the *Bbox*.
- When False, subsequent calls to *update\_from\_data\_xy()* will include the existing bounds of the *Bbox*.

### **intervalx**

*intervalx* is the pair of x coordinates that define the bounding box. It is not guaranteed to be sorted from left to right.

### **intervaly**

*intervaly* is the pair of y coordinates that define the bounding box. It is not guaranteed to be sorted from bottom to top.

### **minpos**

### **minposx**

### **minposy**

### **mutated()**

Return whether the *bbox* has changed since *init*.

### **mutatedx()**

Return whether the x-limits have changed since *init*.

### **mutatedy()**

Return whether the y-limits have changed since *init*.

### **static null()**

(staticmethod) Create a new null *Bbox* from (inf, inf) to (-inf, -inf).

### **p0**

*p0* is the first pair of (x, y) coordinates that define the bounding box. It is not guaranteed to be the bottom-left corner. For that, use *min*.

`p1`

`p1` is the second pair of (x, y) coordinates that define the bounding box. It is not guaranteed to be the top-right corner. For that, use `max`.

`set(other)`

Set this bounding box from the "frozen" bounds of another `Bbox`.

`set_points(points)`

Set the points of the bounding box directly from a numpy array of the form: `[[x0, y0], [x1, y1]]`. No error checking is performed, as this method is mainly for internal use.

`static unit()`

(staticmethod) Create a new unit `Bbox` from (0, 0) to (1, 1).

`update_from_data_xy(xy, ignore=None, updatex=True, updatey=True)`

Update the bounds of the `Bbox` based on the passed in data. After updating, the bounds will have positive *width* and *height*; `x0` and `y0` will be the minimal values.

### Parameters

**xy** [ndarray] A numpy array of 2D points.

**ignore** [bool, optional]

- When `True`, ignore the existing bounds of the `Bbox`.
- When `False`, include the existing bounds of the `Bbox`.
- When `None`, use the last value passed to `ignore()`.

**updatex, updatey** [bool, optional] When `True`, update the x/y values.

`update_from_path(path, ignore=None, updatex=True, updatey=True)`

Update the bounds of the `Bbox` based on the passed in data. After updating, the bounds will have positive *width* and *height*; `x0` and `y0` will be the minimal values.

### Parameters

**path** [`Path`]

**ignore** [bool, optional]

- when `True`, ignore the existing bounds of the `Bbox`.
- when `False`, include the existing bounds of the `Bbox`.
- when `None`, use the last value passed to `ignore()`.

**updatex, updatey** [bool, optional] When `True`, update the x/y values.

`x0`

`x0` is the first of the pair of x coordinates that define the bounding box. `x0` is not guaranteed to be less than `x1`. If you require that, use `xmin`.

`x1`

`x1` is the second of the pair of x coordinates that define the bounding box. `x1` is not guaranteed to be greater than `x0`. If you require that, use `xmax`.

`y0`

`y0` is the first of the pair of y coordinates that define the bounding box. `y0` is not guaranteed to be less than `y1`. If you require that, use `ymin`.

`y1`

`y1` is the second of the pair of y coordinates that define the bounding box. `y1` is not guaranteed to be greater than `y0`. If you require that, use `ymax`.

```
class matplotlib.transforms.BboxBase(shorthand_name=None)
```

Bases: `matplotlib.transforms.TransformNode`

This is the base class of all bounding boxes, and provides read-only access to its data. A mutable bounding box is provided by the `Bbox` class.

The canonical representation is as two points, with no restrictions on their ordering. Convenience properties are provided to get the left, bottom, right and top edges and width and height, but these are not stored explicitly.

Creates a new `TransformNode`.

### Parameters

**`shorthand_name`** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
anchored(c, container=None)
```

Return a copy of the `Bbox`, shifted to position `c` within a container.

### Parameters

**`c`** : May be either:

- A sequence (`cx`, `cy`) where `cx` and `cy` range from 0 to 1, where 0 is left or bottom and 1 is right or top
- a string: - 'C' for centered - 'S' for bottom-center - 'SE' for bottom-left - 'E' for left - etc.

**`container`** [`Bbox`, optional] The box within which the `Bbox` is positioned; it defaults to the initial `Bbox`.

```
bounds
```

Returns (`x0`, `y0`, `width`, `height`).

```
coefs = {'C': (0.5, 0.5), 'E': (1.0, 0.5), 'N': (0.5, 1.0), 'NE': (1.0, 1.0), 'NW': (0, 1.0), 'S':
```

```
contains(x, y)
```

Returns whether (`x`, `y`) is in the bounding box or on its edge.

```
containsx(x)
```

Returns whether `x` is in the closed (`x0`, `x1`) interval.

```
containsy(y)
```

Returns whether `y` is in the closed (`y0`, `y1`) interval.

```
corners()
```

Return an array of points which are the four corners of this rectangle. For example, if this `Bbox` is defined by the points (`a`, `b`) and (`c`, `d`), `corners()` returns (`a`, `b`), (`a`, `d`), (`c`, `b`) and (`c`, `d`).

```
count_contains(vertices)
```

Count the number of vertices contained in the `Bbox`. Any vertices with a non-finite `x` or `y` value are ignored.

### Parameters

**`vertices`** [`Nx2` Numpy array.]

`count_overlaps(bboxes)`

Count the number of bounding boxes that overlap this one.

### Parameters

**bboxes** [sequence of *BboxBase* objects]

`expanded(sw, sh)`

Return a new *Bbox* which is this *Bbox* expanded around its center by the given factors *sw* and *sh*.

`extents`

Returns  $(x_0, y_0, x_1, y_1)$ .

`frozen()`

*TransformNode* is the base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

`fully_contains(x, y)`

Returns whether  $x, y$  is in the bounding box, but not on its edge.

`fully_containsx(x)`

Returns whether  $x$  is in the open  $(x_0, x_1)$  interval.

`fully_containsy(y)`

Returns whether  $y$  is in the open  $(y_0, y_1)$  interval.

`fully_overlaps(other)`

Returns whether this bounding box overlaps with the other bounding box, not including the edges.

### Parameters

**other** [*BboxBase*]

`get_points()`

`height`

The height of the bounding box. It may be negative if  $y_1 < y_0$ .

`static intersection(bbox1, bbox2)`

Return the intersection of the two bboxes or None if they do not intersect.

`intervalx`

*intervalx* is the pair of  $x$  coordinates that define the bounding box. It is not guaranteed to be sorted from left to right.

`intervaly`

*intervaly* is the pair of  $y$  coordinates that define the bounding box. It is not guaranteed to be sorted from bottom to top.

`inverse_transformed(transform)`

Return a new *Bbox* object, statically transformed by the inverse of the given transform.

`is_affine = True`

`is_bbox = True`

`is_unit()`

Returns True if the *Bbox* is the unit bounding box from  $(0, 0)$  to  $(1, 1)$ .

**max**

*max* is the top-right corner of the bounding box.

**min**

*min* is the bottom-left corner of the bounding box.

**overlaps(*other*)**

Returns whether this bounding box overlaps with the other bounding box.

### Parameters

**other** [BboxBase]

**p0**

*p0* is the first pair of (x, y) coordinates that define the bounding box. It is not guaranteed to be the bottom-left corner. For that, use *min*.

**p1**

*p1* is the second pair of (x, y) coordinates that define the bounding box. It is not guaranteed to be the top-right corner. For that, use *max*.

**padded(*p*)**

Return a new *Bbox* that is padded on all four sides by the given value.

**rotated(*radians*)**

Return a new bounding box that bounds a rotated version of this bounding box by the given radians. The new bounding box is still aligned with the axes, of course.

**shrunk(*mx*, *my*)**

Return a copy of the *Bbox*, shrunk by the factor *mx* in the x direction and the factor *my* in the y direction. The lower left corner of the box remains unchanged. Normally *mx* and *my* will be less than 1, but this is not enforced.

**shrunk\_to\_aspect(*box\_aspect*, *container=None*, *fig\_aspect=1.0*)**

Return a copy of the *Bbox*, shrunk so that it is as large as it can be while having the desired aspect ratio, *box\_aspect*. If the box coordinates are relative—that is, fractions of a larger box such as a figure—then the physical aspect ratio of that figure is specified with *fig\_aspect*, so that *box\_aspect* can also be given as a ratio of the absolute dimensions, not the relative dimensions.

**size**

The width and height of the bounding box. May be negative, in the same way as *width* and *height*.

**splitx(\**args*)**

e.g., `bbox.splitx(f1, f2, ...)`

Returns a list of new *Bbox* objects formed by splitting the original one with vertical lines at fractional positions *f1*, *f2*, ...

**splity(\**args*)**

e.g., `bbox.splity(f1, f2, ...)`

Returns a list of new *Bbox* objects formed by splitting the original one with horizontal lines at fractional positions *f1*, *f2*, ...

**transformed(*transform*)**

Return a new *Bbox* object, statically transformed by the given transform.

**translated(*tx*, *ty*)**

Return a copy of the *Bbox*, statically translated by *tx* and *ty*.

```

static union(bboxes)
    Return a Bbox that contains all of the given bboxes.

width
    The width of the bounding box. It may be negative if  $x1 < x0$ .

x0
     $x0$  is the first of the pair of  $x$  coordinates that define the bounding box.  $x0$  is not
    guaranteed to be less than  $x1$ . If you require that, use xmin.

x1
     $x1$  is the second of the pair of  $x$  coordinates that define the bounding box.  $x1$  is not
    guaranteed to be greater than  $x0$ . If you require that, use xmax.

xmax
    xmax is the right edge of the bounding box.

xmin
    xmin is the left edge of the bounding box.

y0
     $y0$  is the first of the pair of  $y$  coordinates that define the bounding box.  $y0$  is not
    guaranteed to be less than  $y1$ . If you require that, use ymin.

y1
     $y1$  is the second of the pair of  $y$  coordinates that define the bounding box.  $y1$  is not
    guaranteed to be greater than  $y0$ . If you require that, use ymax.

ymax
    ymax is the top edge of the bounding box.

ymin
    ymin is the bottom edge of the bounding box.

class matplotlib.transforms.BboxTransform(boxin, boxout, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

    BboxTransform linearly transforms points from one Bbox to another Bbox.

    Create a new BboxTransform that linearly transforms points from boxin to boxout.

    get_matrix()
        Get the Affine transformation array for the affine part of this transform.

    is_separable = True

class matplotlib.transforms.BboxTransformFrom(boxin, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

    BboxTransformFrom linearly transforms points from a given Bbox to the unit bounding box.

    get_matrix()
        Get the Affine transformation array for the affine part of this transform.

    is_separable = True

class matplotlib.transforms.BboxTransformTo(boxout, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

    BboxTransformTo is a transformation that linearly transforms points from the unit bound-
    ing box to a given Bbox.

```

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

```
get_matrix()
    Get the Affine transformation array for the affine part of this transform.

is_separable = True
```

```
class matplotlib.transforms.BboxTransformToMaxOnly(boxout, **kwargs)
    Bases: matplotlib.transforms.BboxTransformTo
```

*BboxTransformTo* is a transformation that linearly transforms points from the unit bounding box to a given *Bbox* with a fixed upper left of (0, 0).

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

```
get_matrix()
    Get the Affine transformation array for the affine part of this transform.
```

```
class matplotlib.transforms.BlendedAffine2D(x_transform, y_transform, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase
```

A "blended" transform uses one transform for the x-direction, and another transform for the y-direction.

This version is an optimization for the case where both child transforms are of type *Affine2DBase*.

Create a new "blended" transform using *x\_transform* to transform the x-axis and *y\_transform* to transform the y-axis.

Both *x\_transform* and *y\_transform* must be 2D affine transforms.

You will generally not call this constructor directly but use the *blended\_transform\_factory()* function instead, which can determine automatically which kind of blended transform to create.

```
contains_branch_seperately(transform)
    Returns whether the given branch is a sub-tree of this transform on each separate dimension.
```

A common use for this method is to identify if a transform is a blended transform containing an axes' data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)
```

```
get_matrix()
    Get the Affine transformation array for the affine part of this transform.
```

```
is_separable = True
```

```
class matplotlib.transforms.BlendedGenericTransform(x_transform, y_transform,
                                                    **kwargs)
    Bases: matplotlib.transforms.Transform
```

A "blended" transform uses one transform for the x-direction, and another transform for the y-direction.

This "generic" version can handle any given child transform in the x- and y-directions.

Create a new "blended" transform using *x\_transform* to transform the x-axis and *y\_transform* to transform the y-axis.

You will generally not call this constructor directly but use the `blended_transform_factory()` function instead, which can determine automatically which kind of blended transform to create.

`contains_branch(other)`

Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

`contains_branch_seperately(transform)`

Returns whether the given branch is a sub-tree of this transform on each separate dimension.

A common use for this method is to identify if a transform is a blended transform containing an axes' data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)
```

`depth`

Returns the number of transforms which have been chained together to form this Transform instance.

---

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

---

`frozen()`

Returns a frozen copy of this transform node. The frozen copy will not update when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`get_affine()`

Get the affine part of this transform.

`has_inverse`

`input_dims = 2`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

`is_affine`

`is_separable = True`

`output_dims = 2`

`pass_through = True`

`transform_non_affine(points)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape  $(N \times \text{input\_dims})$  and returns a numpy array of shape  $(N \times \text{output\_dims})$ .

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

```
class matplotlib.transforms.CompositeAffine2D(a, b, **kwargs)
```

Bases: `matplotlib.transforms.Affine2DBase`

A composite transform formed by applying transform `a` then transform `b`.

This version is an optimization that handles the case where both `a` and `b` are 2D affines.

Create a new composite transform that is the result of applying transform `a` then transform `b`.

Both `a` and `b` must be instances of `Affine2DBase`.

You will generally not call this constructor directly but use the `composite_transform_factory()` function instead, which can automatically choose the best kind of composite transform instance to create.

`depth`

Returns the number of transforms which have been chained together to form this Transform instance.

---

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

---

`get_matrix()`

Get the Affine transformation array for the affine part of this transform.

```
class matplotlib.transforms.CompositeGenericTransform(a, b, **kwargs)
```

Bases: `matplotlib.transforms.Transform`

A composite transform formed by applying transform `a` then transform `b`.

This "generic" version can handle any two arbitrary transformations.

Create a new composite transform that is the result of applying transform `a` then transform `b`.

You will generally not call this constructor directly but use the `composite_transform_factory()` function instead, which can automatically choose the best kind of composite transform instance to create.

`depth`

Returns the number of transforms which have been chained together to form this Transform instance.

---

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

---

`frozen()`

Returns a frozen copy of this transform node. The frozen copy will not update when

its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`get_affine()`

Get the affine part of this transform.

`has_inverse`

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

`is_affine`

`is_separable`

`pass_through = True`

`transform_affine(points)`

Performs only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_non_affine(points)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_path_non_affine(path)`

Returns a path, transformed only by the non-affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

```
class matplotlib.transforms.IdentityTransform(*args, **kwargs)
```

Bases: `matplotlib.transforms.Affine2DBase`

A special class that does one thing, the identity transform, in a fast way.

`frozen()`

Returns a frozen copy of this transform node. The frozen copy will not update when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`get_affine()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

`get_matrix()`

Get the Affine transformation array for the affine part of this transform.

`inverted()`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
x == self.inverted().transform(self.transform(x))
```

`transform(points)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input\_dims) and returns a numpy array of shape (N x output\_dims).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_affine(points)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input\_dims) and returns a numpy array of shape (N x output\_dims).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_non_affine(points)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input\_dims) and returns a numpy array of shape (N x output\_dims).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_path(path)`

Returns a path, transformed only by the non-affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_path_affine(path)`

Returns a path, transformed only by the non-affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_path_non_affine(path)`

Returns a path, transformed only by the non-affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

```
class matplotlib.transforms.LockableBbox(bbox, x0=None, y0=None, x1=None,
                                       y1=None, **kwargs)
```

Bases: *matplotlib.transforms.BboxBase*

A *Bbox* where some elements may be locked at certain values.

When the child bounding box changes, the bounds of this bbox will update accordingly with the exception of the locked elements.

### Parameters

**bbox** [Bbox] The child bounding box to wrap.

**x0** [float or None] The locked value for x0, or None to leave unlocked.

**y0** [float or None] The locked value for y0, or None to leave unlocked.

**x1** [float or None] The locked value for x1, or None to leave unlocked.

**y1** [float or None] The locked value for y1, or None to leave unlocked.

`get_points()`

Get the points of the bounding box directly as a numpy array of the form: `[[x0, y0], [x1, y1]]`.

`locked_x0`

float or None: The value used for the locked x0.

`locked_x1`

float or None: The value used for the locked x1.

`locked_y0`

float or None: The value used for the locked y0.

`locked_y1`

float or None: The value used for the locked y1.

```
class matplotlib.transforms.ScaledTranslation(xt, yt, scale_trans, **kwargs)
```

Bases: *matplotlib.transforms.Affine2DBase*

A transformation that translates by *xt* and *yt*, after *xt* and *yt* have been transformed by the given transform *scale\_trans*.

`get_matrix()`

Get the Affine transformation array for the affine part of this transform.

```
class matplotlib.transforms.Transform(shorthand_name=None)
```

Bases: *matplotlib.transforms.TransformNode*

The base class of all *TransformNode* instances that actually perform a transformation.

All non-affine transformations should be subclasses of this class. New affine transformations should be subclasses of *Affine2D*.

Subclasses of this class should override the following members (at minimum):

- *input\_dims*
- *output\_dims*
- *transform()*
- *is\_separable*
- *has\_inverse*
- *inverted()* (if *has\_inverse* is True)

If the transform needs to do something non-standard with *matplotlib.path.Path* objects, such as adding curves where there were once line segments, it should override:

- *transform\_path()*

Creates a new *TransformNode*.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`contains_branch(other)`

Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

`contains_branch_seperately(other_transform)`

Returns whether the given branch is a sub-tree of this transform on each separate dimension.

A common use for this method is to identify if a transform is a blended transform containing an axes' data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)
```

`depth`

Returns the number of transforms which have been chained together to form this Transform instance.

---

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

---

`get_affine()`

Get the affine part of this transform.

`get_matrix()`

Get the Affine transformation array for the affine part of this transform.

`has_inverse = False`

True if this transform has a corresponding inverse transform.

`input_dims = None`  
 The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

`inverted()`  
 Return the corresponding inverse transformation.  
 The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.  
`x == self.inverted().transform(self.transform(x))`

`is_separable = False`  
 True if this transform is separable in the x- and y- dimensions.

`output_dims = None`  
 The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

`transform(values)`  
 Performs the transformation on the given array of values.  
 Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).  
 Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

`transform_affine(values)`  
 Performs only the affine part of this transformation on the given array of values.  
`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.  
 In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.  
 Accepts a numpy array of shape (N x *input\_dims*) and returns a numpy array of shape (N x *output\_dims*).  
 Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

`transform_angles(angles, pts, radians=False, pushoff=1e-05)`  
 Performs transformation on a set of angles anchored at specific locations.  
 The *angles* must be a column vector (i.e., numpy array).  
 The *pts* must be a two-column numpy array of x,y positions (angle transforms currently only work in 2D). This array must have the same number of rows as *angles*.  
***radians* indicates whether or not input angles are given in** radians (True) or degrees (False; the default).  
***pushoff* is the distance to move away from pts for** determining transformed angles (see discussion of method below).  
 The transformed angles are returned in an array with the same size as *angles*.  
 The generic version of this method uses a very generic algorithm that transforms *pts*, as well as locations very close to *pts*, to find the angle in the transformed system.

`transform_bbox(bbox)`  
 Transform the given bounding box.

Note, for smarter transforms including caching (a common requirement for matplotlib figures), see *TransformedBbox*.

`transform_non_affine(values)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape  $(N \times \text{input\_dims})$  and returns a numpy array of shape  $(N \times \text{output\_dims})$ .

Alternatively, accepts a numpy array of length *input\_dims* and returns a numpy array of length *output\_dims*.

`transform_path(path)`

Returns a transformed path.

*path*: a *Path* instance.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine(path)`

Returns a path, transformed only by the affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_path_non_affine(path)`

Returns a path, transformed only by the non-affine part of this transform.

*path*: a *Path* instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_point(point)`

A convenience function that returns the transformed copy of a single point.

The point is given as a sequence of length *input\_dims*. The transformed point is returned as a sequence of length *output\_dims*.

`class matplotlib.transforms.TransformNode(shorthand_name=None)`

Bases: `object`

*TransformNode* is the base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

Creates a new *TransformNode*.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`INVALID = 3`

`INVALID_AFFINE = 2`

`INVALID_NON_AFFINE = 1`

`frozen()`  
Returns a frozen copy of this transform node. The frozen copy will not update when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`invalidate()`  
Invalidate this *TransformNode* and triggers an invalidation of its ancestors. Should be called any time the transform changes.

`is_affine = False`

`is_bbox = False`

`pass_through = False`

If `pass_through` is True, all ancestors will always be invalidated, even if 'self' is already invalid.

`set_children(*children)`

Set the children of the transform, to let the invalidation system know which transforms can invalidate this transform. Should be called from the constructor of any transforms that depend on other transforms.

`class matplotlib.transforms.TransformWrapper(child)`

Bases: *matplotlib.transforms.Transform*

A helper class that holds a single child transform and acts equivalently to it.

This is useful if a node of the transform tree must be replaced at run time with a transform of a different type. This class allows that replacement to correctly trigger invalidation.

Note that *TransformWrapper* instances must have the same input and output dimensions during their entire lifetime, so the child transform may only be replaced with another child transform of the same dimensions.

*child*: A class:*Transform* instance. This child may later be replaced with `set()`.

`frozen()`

Returns a frozen copy of this transform node. The frozen copy will not update when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`has_inverse`

`is_affine`

`is_separable`

`pass_through = True`

`set(child)`

Replace the current child of this transform with another one.

The new child must have the same number of input and output dimensions as the current child.

`class matplotlib.transforms.TransformedException(bbox, transform, **kwargs)`

Bases: *matplotlib.transforms.BboxBase*

A *Bbox* that is automatically transformed by a given transform. When either the child bounding box or transform changes, the bounds of this bbox will update accordingly.

### Parameters

**bbox** [*Bbox*]

**transform** [*Transform*]`get_points()`

Get the points of the bounding box directly as a numpy array of the form: `[[x0, y0], [x1, y1]]`.

```
class matplotlib.transforms.TransformPatchPath(patch)
```

Bases: `matplotlib.transforms.TransformPatch`

A `TransformPatchPath` caches a non-affine transformed copy of the `Patch`. This cached copy is automatically updated when the non-affine part of the transform or the patch changes.

Create a new `TransformPatchPath` from the given `Patch`.

```
class matplotlib.transforms.TransformPath(path, transform)
```

Bases: `matplotlib.transforms.TransformNode`

A `TransformPath` caches a non-affine transformed copy of the `Path`. This cached copy is automatically updated when the non-affine part of the transform changes.

---

**Note:** Paths are considered immutable by this class. Any update to the path's vertices/codes will not trigger a transform recomputation.

---

Create a new `TransformPath` from the given `Path` and `Transform`.

`get_affine()``get_fully_transformed_path()`

Return a fully-transformed copy of the child path.

`get_transformed_path_and_affine()`

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation.

`get_transformed_points_and_affine()`

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation. Unlike `get_transformed_path_and_affine()`, no interpolation will be performed.

```
matplotlib.transforms.blended_transform_factory(x_transform, y_transform)
```

Create a new "blended" transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

A faster version of the blended transform is returned for the case where both child transforms are affine.

```
matplotlib.transforms.composite_transform_factory(a, b)
```

Create a new composite transform that is the result of applying transform a then transform b.

Shortcut versions of the blended transform are provided for the case where both child transforms are affine, or one or the other is the identity transform.

Composite transforms may also be created using the '+' operator, e.g.:

```
c = a + b
```

```
matplotlib.transforms.interval_contains(interval, val)
```

Check, inclusively, whether an interval includes a given value.

**Parameters**

**interval** [sequence of scalar] A 2-length sequence, endpoints that define the interval.

**val** [scalar] Value to check is within interval.

**Returns**

**bool** Returns true if given val is within the interval.

`matplotlib.transforms.interval_contains_open(interval, val)`

Check, excluding endpoints, whether an interval includes a given value.

**Parameters**

**interval** [sequence of scalar] A 2-length sequence, endpoints that define the interval.

**val** [scalar] Value to check is within interval.

**Returns**

**bool** Returns true if given val is within the interval.

`matplotlib.transforms.nonsingular(vmin, vmax, expander=0.001, tiny=1e-15, increasing=True)`

Modify the endpoints of a range as needed to avoid singularities.

**Parameters**

**vmin, vmax** [float] The initial endpoints.

**expander** [float, optional, default: 0.001] Fractional amount by which *vmin* and *vmax* are expanded if the original interval is too small, based on *tiny*.

**tiny** [float, optional, default: 1e-15] Threshold for the ratio of the interval to the maximum absolute value of its endpoints. If the interval is smaller than this, it will be expanded. This value should be around 1e-15 or larger; otherwise the interval will be approaching the double precision resolution limit.

**increasing** [bool, optional, default: True] If True, swap *vmin*, *vmax* if  $vmin > vmax$ .

**Returns**

**vmin, vmax** [float] Endpoints, expanded and/or swapped if necessary. If either input is inf or NaN, or if both inputs are 0 or very close to zero, it returns *-expander, expander*.

`matplotlib.transforms.offset_copy(trans, fig=None, x=0.0, y=0.0, units='inches')`

Return a new transform with an added offset.

**Parameters**

**trans** [*Transform* instance] Any transform, to which offset will be applied.

**fig** [*Figure*, optional, default: None] Current figure. It can be None if *units* are 'dots'.

**x, y** [float, optional, default: 0.0] Specifies the offset to apply.

**units** [{'inches', 'points', 'dots'}, optional] Units of the offset.

**Returns**

**trans** [*Transform* instance] Transform with applied offset.

## 18.44 triangular grids

### 18.44.1 matplotlib.tri

Unstructured triangular grid functions.

```
class matplotlib.tri.Triangulation(x, y, triangles=None, mask=None)
```

An unstructured triangular grid consisting of `npoints` points and `ntri` triangles. The triangles can either be specified by the user or automatically generated using a Delaunay triangulation.

**Parameters**

**x, y** [array-like of shape (`npoints`)] Coordinates of grid points.

**triangles** [integer array\_like of shape (`ntri`, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

**mask** [boolean array-like of shape (`ntri`), optional] Which triangles are masked out.

**Notes**

For a `Triangulation` to be valid it must not have duplicate points, triangles formed from colinear points, or overlapping triangles.

**Attributes**

**edges** [int array of shape (`nedges`, 2)] Return integer array of shape (`nedges`, 2) containing all edges of non-masked triangles.

**neighbors** [int array of shape (`ntri`, 3)] Return integer array of shape (`ntri`, 3) containing neighbor triangles.

**mask** [bool array of shape (`ntri`, 3)] Masked out triangles.

**is\_delaunay** [bool] Whether the `Triangulation` is a calculated Delaunay triangulation (where `triangles` was not specified) or not.

```
calculate_plane_coefficients(z)
```

Calculate plane equation coefficients for all unmasked triangles from the point (`x`, `y`) coordinates and specified `z`-array of shape (`npoints`). The returned array has shape (`npoints`, 3) and allows `z`-value at (`x`, `y`) position in triangle `tri` to be calculated using `z = array[tri, 0] * x + array[tri, 1] * y + array[tri, 2]`.

**edges**

Return integer array of shape (`nedges`, 2) containing all edges of non-masked triangles.

Each row defines an edge by its start point index and end point index. Each edge appears only once, i.e. for an edge between points  $i$  and  $j$ , there will only be either  $(i, j)$  or  $(j, i)$ .

`get_cpp_triangulation()`

Return the underlying C++ Triangulation object, creating it if necessary.

`static get_from_args_and_kwargs(*args, **kwargs)`

Return a Triangulation object from the args and kwargs, and the remaining args and kwargs with the consumed values removed.

There are two alternatives: either the first argument is a Triangulation object, in which case it is returned, or the args and kwargs are sufficient to create a new Triangulation to return. In the latter case, see `Triangulation.__init__` for the possible args and kwargs.

`get_masked_triangles()`

Return an array of triangles that are not masked.

`get_trifinder()`

Return the default `matplotlib.tri.TriFinder` of this triangulation, creating it if necessary. This allows the same TriFinder object to be easily shared.

`neighbors`

Return integer array of shape  $(ntri, 3)$  containing neighbor triangles.

For each triangle, the indices of the three triangles that share the same edges, or -1 if there is no such neighboring triangle. `neighbors[i,j]` is the triangle that is the neighbor to the edge from point index `triangles[i,j]` to point index `triangles[i,(j+1)%3]`.

`set_mask(mask)`

Set or clear the mask array. This is either None, or a boolean array of shape  $(ntri)$ .

`class matplotlib.tri.TriFinder(triangulation)`

Abstract base class for classes used to find the triangles of a Triangulation in which  $(x,y)$  points lie.

Rather than instantiate an object of a class derived from TriFinder, it is usually better to use the function `matplotlib.tri.Triangulation.get_trifinder()`.

Derived classes implement `__call__(x,y)` where  $x,y$  are array\_like point coordinates of the same shape.

`class matplotlib.tri.TrapezoidMapTriFinder(triangulation)`

Bases: `matplotlib.tri.trifinder.TriFinder`

*TriFinder* class implemented using the trapezoid map algorithm from the book "Computational Geometry, Algorithms and Applications", second edition, by M. de Berg, M. van Kreveld, M. Overmars and O. Schwarzkopf.

The triangulation must be valid, i.e. it must not have duplicate points, triangles formed from colinear points, or overlapping triangles. The algorithm has some tolerance to triangles formed from colinear points, but this should not be relied upon.

`class matplotlib.tri.TriInterpolator(triangulation, z, trifinder=None)`

Abstract base class for classes used to perform interpolation on triangular grids.

Derived classes implement the following methods:

- `__call__(x, y)`, where  $x, y$  are array\_like point coordinates of the same shape, and that returns a masked array of the same shape containing the interpolated  $z$ -values.

- `gradient(x, y)`, where `x, y` are array\_like point coordinates of the same shape, and that returns a list of 2 masked arrays of the same shape containing the 2 derivatives of the interpolator (derivatives of interpolated `z` values with respect to `x` and `y`).

```
class matplotlib.tri.LinearTriInterpolator(triangulation, z, trifinder=None)
```

Bases: `matplotlib.tri.triinterpolate.TriInterpolator`

A `LinearTriInterpolator` performs linear interpolation on a triangular grid.

Each triangle is represented by a plane so that an interpolated value at point `(x,y)` lies on the plane of the triangle containing `(x,y)`. Interpolated values are therefore continuous across the triangulation, but their first derivatives are discontinuous at edges between triangles.

### Parameters

**triangulation** [*Triangulation* object] The triangulation to interpolate over.

**z** [array\_like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.

**trifinder** [*TriFinder* object, optional] If this is not specified, the Triangulation's default `TriFinder` will be used by calling `matplotlib.tri.Triangulation.get_trifinder()`.

### Methods

<code>'__call__' (x, y)</code>	( Returns interpolated values at x,y points)
<code>'gradient' (x, y)</code>	(Returns interpolated derivatives at x,y points)

```
gradient(x, y)
```

Returns a list of 2 masked arrays containing interpolated derivatives at the specified `x,y` points.

### Parameters

**x, y** [array-like] `x` and `y` coordinates of the same shape and any number of dimensions.

### Returns

**dzdx, dzdy** [`np.ma.array`] 2 masked arrays of the same shape as `x` and `y`; values corresponding to `(x,y)` points outside of the triangulation are masked out. The first returned array contains the values of  $\frac{\partial z}{\partial x}$  and the second those of  $\frac{\partial z}{\partial y}$ .

```
class matplotlib.tri.CubicTriInterpolator(triangulation, z, kind='min_E',  
                                         trifinder=None, dz=None)
```

Bases: `matplotlib.tri.triinterpolate.TriInterpolator`

A `CubicTriInterpolator` performs cubic interpolation on triangular grids.

In one-dimension - on a segment - a cubic interpolating function is defined by the values of the function and its derivative at both ends. This is almost the same in 2-d inside a triangle, except that the values of the function and its 2 derivatives have to be defined at each triangle node.

The `CubicTriInterpolator` takes the value of the function at each node - provided by the user - and internally computes the value of the derivatives, resulting in a smooth interpolation. (As a special feature, the user can also impose the value of the derivatives at each node, but this is not supposed to be the common usage.)

### Parameters

**triangulation** [*Triangulation* object] The triangulation to interpolate over.

**z** [array\_like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.

**kind** [{'min\_E', 'geom', 'user'}, optional] Choice of the smoothing algorithm, in order to compute the interpolant derivatives (defaults to 'min\_E'):

- if 'min\_E': (default) The derivatives at each node is computed to minimize a bending energy.
- if 'geom': The derivatives at each node is computed as a weighted average of relevant triangle normals. To be used for speed optimization (large grids).
- if 'user': The user provides the argument `dz`, no computation is hence needed.

**trifinder** [*TriFinder* object, optional] If not specified, the *Triangulation*'s default *TriFinder* will be used by calling `matplotlib.tri.Triangulation.get_trifinder()`.

**dz** [tuple of array\_likes (dzdx, dzdy), optional] Used only if `kind = 'user'`. In this case `dz` must be provided as (dzdx, dzdy) where dzdx, dzdy are arrays of the same shape as `z` and are the interpolant first derivatives at the *triangulation* points.

### Notes

This note is a bit technical and details the way a *CubicTriInterpolator* computes a cubic interpolation.

The interpolation is based on a Clough-Tocher subdivision scheme of the *triangulation* mesh (to make it clearer, each triangle of the grid will be divided in 3 child-triangles, and on each child triangle the interpolated function is a cubic polynomial of the 2 coordinates). This technique originates from FEM (Finite Element Method) analysis; the element used is a reduced Hsieh-Clough-Tocher (HCT) element. Its shape functions are described in [1]. The assembled function is guaranteed to be C1-smooth, i.e. it is continuous and its first derivatives are also continuous (this is easy to show inside the triangles but is also true when crossing the edges).

In the default case (`kind = 'min_E'`), the interpolant minimizes a curvature energy on the functional space generated by the HCT element shape functions - with imposed values but arbitrary derivatives at each node. The minimized functional is the integral of the so-called total curvature (implementation based on an algorithm from [2] - PCG sparse solver):

$$E(z) = \frac{1}{2} \int_{\Omega} \left( \left( \frac{\partial^2 z}{\partial x^2} \right)^2 + \left( \frac{\partial^2 z}{\partial y^2} \right)^2 + 2 \left( \frac{\partial^2 z}{\partial y \partial x} \right)^2 \right) dx dy \quad (18.6)$$

If the case *kind* = 'geom' is chosen by the user, a simple geometric approximation is used (weighted average of the triangle normal vectors), which could improve speed on very large grids.

## References

[1], [2]

## Methods

' <b>_call_</b> ' (x, y)	( Returns interpolated values at x,y points)
' <b>gradient</b> ' (x, y)	(Returns interpolated derivatives at x,y points)

`gradient(x, y)`

Returns a list of 2 masked arrays containing interpolated derivatives at the specified x,y points.

### Parameters

**x, y** [array-like] x and y coordinates of the same shape and any number of dimensions.

### Returns

**dzdx, dzdy** [np.ma.array] 2 masked arrays of the same shape as x and y; values corresponding to (x,y) points outside of the triangulation are masked out. The first returned array contains the values of  $\frac{\partial z}{\partial x}$  and the second those of  $\frac{\partial z}{\partial y}$ .

`class matplotlib.tri.TriRefiner(triangulation)`

Abstract base class for classes implementing mesh refinement.

A TriRefiner encapsulates a Triangulation object and provides tools for mesh refinement and interpolation.

Derived classes must implements:

- `refine_triangulation(return_tri_index=False, **kwargs)` , where the optional keyword arguments *kwargs* are defined in each TriRefiner concrete implementation, and which returns :
  - a refined triangulation
  - optionally (depending on *return\_tri\_index*), for each point of the refined triangulation: the index of the initial triangulation triangle to which it belongs.
- `refine_field(z, triinterpolator=None, **kwargs)` , where:
  - *z* array of field values (to refine) defined at the base triangulation nodes
  - *triinterpolator* is a *TriInterpolator* (optional)
  - the other optional keyword arguments *kwargs* are defined in each TriRefiner concrete implementation

and which returns (as a tuple) a refined triangular mesh and the interpolated values of the field at the refined triangulation nodes.

```
class matplotlib.tri.UniformTriRefiner(triangulation)
```

```
    Bases: matplotlib.tri.trirefine.TriRefiner
```

Uniform mesh refinement by recursive subdivisions.

### Parameters

**triangulation** [*Triangulation*] The encapsulated triangulation (to be refined)

```
refine_field(z, triinterpolator=None, subdiv=3)
```

Refines a field defined on the encapsulated triangulation.

Returns *refi\_tri* (refined triangulation), *refi\_z* (interpolated values of the field at the node of the refined triangulation).

### Parameters

**z** [1d-array-like of length *n\_points*] Values of the field to refine, defined at the nodes of the encapsulated triangulation. (*n\_points* is the number of points in the initial triangulation)

**triinterpolator** [*TriInterpolator*, optional] Interpolator used for field interpolation. If not specified, a *CubicTriInterpolator* will be used.

**subdiv** [integer, optional] Recursion level for the subdivision. Defaults to 3. Each triangle will be divided into  $4^{**subdiv}$  child triangles.

### Returns

**refi\_tri** [*Triangulation* object] The returned refined triangulation

**refi\_z** [1d array of length: *refi\_tri* node count.] The returned interpolated field (at *refi\_tri* nodes)

```
refine_triangulation(return_tri_index=False, subdiv=3)
```

Computes an uniformly refined triangulation *refi\_triangulation* of the encapsulated triangulation.

This function refines the encapsulated triangulation by splitting each father triangle into 4 child sub-triangles built on the edges midside nodes, recursively (level of recursion *subdiv*). In the end, each triangle is hence divided into  $4^{**subdiv}$  child triangles. The default value for *subdiv* is 3 resulting in 64 refined subtriangles for each triangle of the initial triangulation.

### Parameters

**return\_tri\_index** [boolean, optional] Boolean indicating whether an index table indicating the father triangle index of each point will be returned. Default value False.

**subdiv** [integer, optional] Recursion level for the subdivision. Defaults value 3. Each triangle will be divided into  $4^{**subdiv}$  child triangles.

### Returns

**refi\_triangulation** [*Triangulation*] The returned refined triangulation

**found\_index** [array-like of integers] Index of the initial triangulation containing triangle, for each point of *refi\_triangulation*. Returned only if *return\_tri\_index* is set to True.

```
class matplotlib.tri.TriAnalyzer(triangulation)
```

Define basic tools for triangular mesh analysis and improvement.

A TriAnalyzer encapsulates a *Triangulation* object and provides basic tools for mesh analysis and mesh improvement.

### Parameters

**triangulation** [*Triangulation* object] The encapsulated triangulation to analyze.

### Attributes

#### 'scale\_factors'

`circle_ratios(rescale=True)`

Returns a measure of the triangulation triangles flatness.

The ratio of the incircle radius over the circumcircle radius is a widely used indicator of a triangle flatness. It is always  $\leq 0.5$  and  $= 0.5$  only for equilateral triangles. Circle ratios below 0.01 denote very flat triangles.

To avoid unduly low values due to a difference of scale between the 2 axis, the triangular mesh can first be rescaled to fit inside a unit square with *scale\_factors* (Only if *rescale* is True, which is its default value).

### Parameters

**rescale** [boolean, optional] If True, a rescaling will be internally performed (based on *scale\_factors*, so that the (unmasked) triangles fit exactly inside a unit square mesh. Default is True.

### Returns

**circle\_ratios** [masked array] Ratio of the incircle radius over the circumcircle radius, for each 'rescaled' triangle of the encapsulated triangulation. Values corresponding to masked triangles are masked out.

`get_flat_tri_mask(min_circle_ratio=0.01, rescale=True)`

Eliminates excessively flat border triangles from the triangulation.

Returns a mask *new\_mask* which allows to clean the encapsulated triangulation from its border-located flat triangles (according to their *circle\_ratios()*). This mask is meant to be subsequently applied to the triangulation using *matplotlib.tri.Triangulation.set\_mask()*. *new\_mask* is an extension of the initial triangulation mask in the sense that an initially masked triangle will remain masked.

The *new\_mask* array is computed recursively; at each step flat triangles are removed only if they share a side with the current mesh border. Thus no new holes in the triangulated domain will be created.

### Parameters

**min\_circle\_ratio** [float, optional] Border triangles with incircle/circumcircle radii ratio  $r/R$  will be removed if  $r/R < min\_circle\_ratio$ . Default value: 0.01

**rescale** [boolean, optional] If True, a rescaling will first be internally performed (based on *scale\_factors*), so that the (unmasked) triangles fit exactly inside a unit square mesh. This rescaling accounts for the difference of scale which might exist between the 2 axis. Default (and recommended) value is True.

### Returns

**new\_mask** [array-like of booleans] Mask to apply to encapsulated triangulation. All the initially masked triangles remain masked in the *new\_mask*.

### Notes

The rationale behind this function is that a Delaunay triangulation - of an unstructured set of points - sometimes contains almost flat triangles at its border, leading to artifacts in plots (especially for high-resolution contouring). Masked with computed *new\_mask*, the encapsulated triangulation would contain no more unmasked border triangles with a circle ratio below *min\_circle\_ratio*, thus improving the mesh quality for subsequent plots or interpolation.

### scale\_factors

Factors to rescale the triangulation into a unit square.

Returns *k*, tuple of 2 scale factors.

### Returns

**k** [tuple of 2 floats (kx, ky)] Tuple of floats that would rescale the triangulation: [triangulation.x \* kx, triangulation.y \* ky] fits exactly inside a unit square.

## 18.45 type1font

### 18.45.1 matplotlib.type1font

This module contains a class representing a Type 1 font.

This version reads pfa and pfb files and splits them for embedding in pdf files. It also supports SlantFont and ExtendFont transformations, similarly to pdfTeX and friends. There is no support yet for subsetting.

Usage:

```
>>> font = Type1Font(filename)
>>> clear_part, encrypted_part, finale = font.parts
>>> slanted_font = font.transform({'slant': 0.167})
>>> extended_font = font.transform({'extend': 1.2})
```

Sources:

- Adobe Technical Note #5040, Supporting Downloadable PostScript Language Fonts.
- Adobe Type 1 Font Format, Adobe Systems Incorporated, third printing, v1.1, 1993. ISBN 0-201-57044-0.

```
class matplotlib.type1font.Type1Font(input)
```

Bases: `object`

A class representing a Type-1 font, for use by backends.

### Attributes

**parts** [tuple] A 3-tuple of the cleartext part, the encrypted part, and the finale of zeros.

**prop** [Dict[str, Any]] A dictionary of font properties.

Initialize a Type-1 font. *input* can be either the file name of a pfb file or a 3-tuple of already-decoded Type-1 font parts.

parts

prop

transform(*effects*)

Transform the font by slanting or extending. *effects* should be a dict where *effects*['slant'] is the tangent of the angle that the font is to be slanted to the right (so negative values slant to the left) and *effects*['extend'] is the multiplier by which the font is to be extended (so values less than 1.0 condense). Returns a new *Type1Font* object.

## 18.46 units

### 18.46.1 matplotlib.units

The classes here provide support for using custom classes with Matplotlib, e.g., those that do not expose the array interface but know how to convert themselves to arrays. It also supports classes with units and units conversion. Use cases include converters for custom objects, e.g., a list of datetime objects, as well as for objects that are unit aware. We don't assume any particular units implementation; rather a units implementation must provide the register with the Registry converter dictionary and a *ConversionInterface*. For example, here is a complete implementation which supports plotting with native datetime objects:

```
import matplotlib.units as units
import matplotlib.dates as dates
import matplotlib.ticker as ticker
import datetime

class DateConverter(units.ConversionInterface):

    @staticmethod
    def convert(value, unit, axis):
        'Convert a datetime value to a scalar or array'
        return dates.date2num(value)

    @staticmethod
    def axisinfo(unit, axis):
        'Return major and minor tick locators and formatters'
        if unit != 'date': return None
        majloc = dates.AutoDateLocator()
        majfmt = dates.AutoDateFormatter(majloc)
        return AxisInfo(majloc=majloc,
                        majfmt=majfmt,
                        label='date')

    @staticmethod
    def default_units(x, axis):
        'Return the default unit for x or None'
        return 'date'
```

(continues on next page)

(continued from previous page)

```
# Finally we register our object type with the Matplotlib units registry.
units.registry[datetime.date] = DateConverter()
```

```
class matplotlib.units.AxisInfo(majloc=None,      minloc=None,      majfmt=None,
                                minfmt=None, label=None, default_limits=None)
```

Bases: `object`

Information to support default axis labeling, tick labeling, and default limits. An instance of this class must be returned by `ConversionInterface.axisinfo()`.

### Parameters

**majloc, minloc** [Locator, optional] Tick locators for the major and minor ticks.

**majfmt, minfmt** [Formatter, optional] Tick formatters for the major and minor ticks.

**label** [str, optional] The default axis label.

**default\_limits** [optional] The default min and max limits of the axis if no data has been plotted.

### Notes

If any of the above are `None`, the axis will simply use the default value.

```
class matplotlib.units.ConversionInterface
```

Bases: `object`

The minimal interface for a converter to take custom data types (or sequences) and convert them to values Matplotlib can use.

```
static axisinfo(unit, axis)
```

Return an `AxisInfo` instance for the axis with the specified units.

```
static convert(obj, unit, axis)
```

Convert `obj` using `unit` for the specified `axis`. If `obj` is a sequence, return the converted sequence. The output must be a sequence of scalars that can be used by the numpy array layer.

```
static default_units(x, axis)
```

Return the default unit for `x` or `None` for the given axis.

```
static is_numlike(x)
```

The Matplotlib datalim, autoscaling, locators etc work with scalars which are the units converted to floats given the current unit. The converter may be passed these floats, or arrays of them, even when units are set.

```
class matplotlib.units.Registry
```

Bases: `dict`

A register that maps types to conversion interfaces.

```
get_converter(x)
```

Get the converter for data that has the same type as `x`. If no converters are registered for `x`, returns `None`.

## 18.47 widgets

### 18.47.1 matplotlib.widgets

#### GUI neutral widgets

Widgets that are designed to work for any of the GUI backends. All of these widgets require you to predefine a `matplotlib.axes.Axes` instance and pass that as the first arg. matplotlib doesn't try to be too smart with respect to layout - you will have to figure out how wide and tall you want your Axes to be to accommodate your widget.

```
class matplotlib.widgets.AxesWidget(ax)
```

Bases: `matplotlib.widgets.Widget`

Widget that is connected to a single `Axes`.

To guarantee that the widget remains responsive and not garbage-collected, a reference to the object should be maintained by the user.

This is necessary because the callback registry maintains only weak-refs to the functions, which are member functions of the widget. If there are no references to the widget object it may be garbage collected which will disconnect the callbacks.

Attributes:

**ax** [`Axes`] The parent axes for the widget

**canvas** [`FigureCanvasBase` subclass] The parent figure canvas for the widget.

**active** [bool] If False, the widget does not respond to events.

```
connect_event(event, callback)
```

Connect callback with an event.

This should be used in lieu of `figure.canvas.mpl_connect` since this function stores callback ids for later clean up.

```
disconnect_events()
```

Disconnect all events created by this widget.

```
class matplotlib.widgets.Button(ax, label, image=None, color='0.85', hover-  
                                color='0.95')
```

Bases: `matplotlib.widgets.AxesWidget`

A GUI neutral button.

For the button to remain responsive you must keep a reference to it. Call `on_clicked()` to connect to the button.

#### Attributes

**ax** : The `matplotlib.axes.Axes` the button renders into.

**label** : A `matplotlib.text.Text` instance.

**color** : The color of the button when not hovering.

**hovercolor** : The color of the button when hovering.

#### Parameters

**ax** [`matplotlib.axes.Axes`] The `matplotlib.axes.Axes` instance the button will be placed into.

**label** [str] The button text. Accepts string.

**image** [array, mpl image, Pillow Image] The image to place in the button, if not *None*. Can be any legal arg to `imshow` (numpy array, matplotlib Image instance, or Pillow Image).

**color** [color] The color of the button when not activated

**hovercolor** [color] The color of the button when the mouse is over it

`disconnect(cid)`

remove the observer with connection id *cid*

`on_clicked(func)`

When the button is clicked, call this *func* with event.

A connection id is returned. It can be used to disconnect the button from its callback.

`class matplotlib.widgets.CheckButtons(ax, labels, actives=None)`

Bases: `matplotlib.widgets.AxesWidget`

A GUI neutral set of check buttons.

For the check buttons to remain responsive you must keep a reference to this object.

The following attributes are exposed

**ax** The `matplotlib.axes.Axes` instance the buttons are located in

**labels** List of `matplotlib.text.Text` instances

**lines** List of (*line1*, *line2*) tuples for the x's in the check boxes. These lines exist for each box, but have `set_visible(False)` when its box is not checked.

**rectangles** List of `matplotlib.patches.Rectangle` instances

Connect to the CheckButtons with the `on_clicked()` method

Add check buttons to `matplotlib.axes.Axes` instance *ax*

#### Parameters

**ax** [*Axes*] The parent axes for the widget.

**labels** [List[str]] The labels of the check buttons.

**actives** [List[bool], optional] The initial check states of the buttons. The list must have the same length as *labels*. If not given, all buttons are unchecked.

`disconnect(cid)`

remove the observer with connection id *cid*

`get_status()`

returns a tuple of the status (True/False) of all of the check buttons

`on_clicked(func)`

When the button is clicked, call *func* with button label

A connection id is returned which can be used to disconnect

`set_active(index)`

Directly (de)activate a check button by index.

***index*** is an index into the original label list that this object was constructed with. Raises `ValueError` if *index* is invalid.

Callbacks will be triggered if `eventson` is `True`.

```
class matplotlib.widgets.Cursor(ax, horizOn=True, vertOn=True, useblit=False, **line-
                                props)
```

Bases: `matplotlib.widgets.AxesWidget`

A horizontal and vertical line that spans the axes and moves with the pointer. You can turn off the `hline` or `vline` respectively with the following attributes:

***horizOn*** Controls the visibility of the horizontal line

***vertOn*** Controls the visibility of the horizontal line

and the visibility of the cursor itself with the *visible* attribute.

For the cursor to remain responsive you must keep a reference to it.

Add a cursor to *ax*. If `useblit=True`, use the backend-dependent blitting features for faster updates. *lineprops* is a dictionary of line properties.

```
clear(event)
    clear the cursor
```

```
onmove(event)
    on mouse motion draw the cursor if visible
```

```
class matplotlib.widgets.EllipseSelector(ax,          onselect,          drawtype='box',
                                         minspanx=None,      minspany=None,
                                         useblit=False,    lineprops=None,  rect-
                                         props=None,       spancoords='data',
                                         button=None,      maxdist=10,
                                         marker_props=None, interactive=False,
                                         state_modifier_keys=None)
```

Bases: `matplotlib.widgets.RectangleSelector`

Select an elliptical region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.widgets import EllipseSelector

def onselect(eclick, erelease):
    "eclick and erelease are matplotlib events at press and release."
    print('startposition: (%f, %f)' % (eclick.xdata, eclick.ydata))
    print('endposition   : (%f, %f)' % (erelease.xdata, erelease.ydata))
    print('used button   : ', eclick.button)

def toggle_selector(event):
    print(' Key pressed.')
    if event.key in ['Q', 'q'] and toggle_selector.ES.active:
        print('EllipseSelector deactivated.')
        toggle_selector.RS.set_active(False)
    if event.key in ['A', 'a'] and not toggle_selector.ES.active:
        print('EllipseSelector activated.')
        toggle_selector.ES.set_active(True)
```

(continues on next page)

(continued from previous page)

```
x = np.arange(100.) / 99
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)

toggle_selector.ES = EllipseSelector(ax, onselect, drawtype='line')
fig.canvas.connect('key_press_event', toggle_selector)
plt.show()
```

Create a selector in *ax*. When a selection is made, clear the span and call `onselect` with:

```
onselect(pos_1, pos_2)
```

and clear the drawn box/line. The `pos_1` and `pos_2` are arrays of length 2 containing the x- and y-coordinate.

If *minspanx* is not *None* then events smaller than *minspanx* in x direction are ignored (it's the same for y).

The rectangle is drawn with *rectprops*; default:

```
rectprops = dict(facecolor='red', edgecolor = 'black',
                 alpha=0.2, fill=True)
```

The line is drawn with *lineprops*; default:

```
lineprops = dict(color='black', linestyle='-',
                 linewidth = 2, alpha=0.5)
```

Use *drawtype* if you want the mouse to draw a line, a box or nothing between click and actual position by setting

`drawtype = 'line'`, `drawtype='box'` or `drawtype = 'none'`. Drawing a line would result in a line from vertex A to vertex C in a rectangle ABCD.

*spancoords* is one of 'data' or 'pixels'. If 'data', *minspanx* and *minspany* will be interpreted in the same coordinates as the x and y axis. If 'pixels', they are in pixels.

*button* is a list of integers indicating which mouse buttons should be used for rectangle selection. You can also specify a single integer if only a single button is desired. Default is *None*, which does not limit which button can be used.

**Note, typically:** 1 = left mouse button 2 = center mouse button (scroll wheel) 3 = right mouse button

*interactive* will draw a set of handles and allow you interact with the widget after it is drawn.

*state\_modifier\_keys* are keyboard modifiers that affect the behavior of the widget.

The defaults are: `dict(move=' ', clear='escape', square='shift', center='ctrl')`

Keyboard modifiers, which: 'move': Move the existing shape. 'clear': Clear the current shape. 'square': Makes the shape square. 'center': Make the initial point the center of the shape. 'square' and 'center' can be combined.

`draw_shape(extents)`

```
class matplotlib.widgets.Lasso(ax, xy, callback=None, useblit=True)
```

Bases: `matplotlib.widgets.AxesWidget`

Selection curve of an arbitrary shape.

The selected path can be used in conjunction with `contains_point()` to select data points from an image.

Unlike `LassoSelector`, this must be initialized with a starting point `xy`, and the `Lasso` events are destroyed upon release.

### Parameters

**ax** [`Axes`] The parent axes for the widget.

**xy** [array] Coordinates of the start of the lasso.

**callback** [callable] Whenever the lasso is released, the `callback` function is called and passed the vertices of the selected path.

`onmove(event)`

`onrelease(event)`

```
class matplotlib.widgets.LassoSelector(ax, onselect=None, useblit=True, line-props=None, button=None)
```

Bases: `matplotlib.widgets._SelectorWidget`

Selection curve of an arbitrary shape.

For the selector to remain responsive you must keep a reference to it.

The selected path can be used in conjunction with `contains_point` to select data points from an image.

In contrast to `Lasso`, `LassoSelector` is written with an interface similar to `RectangleSelector` and `SpanSelector`, and will continue to interact with the axes until disconnected.

Example usage:

```
ax = subplot(111)
ax.plot(x,y)

def onselect(verts):
    print(verts)
lasso = LassoSelector(ax, onselect)
```

### Parameters

**ax** [`Axes`] The parent axes for the widget.

**onselect** [function] Whenever the lasso is released, the `onselect` function is called and passed the vertices of the selected path.

**button** [List[Int], optional] A list of integers indicating which mouse buttons should be used for rectangle selection. You can also specify a single integer if only a single button is desired. Default is `None`, which does not limit which button can be used.

Note, typically:

- 1 = left mouse button
- 2 = center mouse button (scroll wheel)

- 3 = right mouse button

```
onpress(event)
onrelease(event)
```

```
class matplotlib.widgets.LockDraw
    Bases: object
```

Some widgets, like the cursor, draw onto the canvas, and this is not desirable under all circumstances, like when the toolbar is in zoom-to-rect mode and drawing a rectangle. To avoid this, a widget can acquire a canvas' lock with `canvas.widgetlock(widget)` before drawing on the canvas; this will prevent other widgets from doing so at the same time (if they also try to acquire the lock first).

```
available(o)
    Return whether drawing is available to o.

isowner(o)
    Return whether o owns this lock.

locked()
    Return whether the lock is currently held by an owner.

release(o)
    Release the lock from o.
```

```
class matplotlib.widgets.MultiCursor(canvas, axes, useblit=True, horizOn=False, ver-
    tOn=True, **lineprops)
```

```
    Bases: matplotlib.widgets.Widget
```

Provide a vertical (default) and/or horizontal line cursor shared between multiple axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```
from matplotlib.widgets import MultiCursor
import matplotlib.pyplot as plt
import numpy as np

fig, (ax1, ax2) = plt.subplots(nrows=2, sharex=True)
t = np.arange(0.0, 2.0, 0.01)
ax1.plot(t, np.sin(2*np.pi*t))
ax2.plot(t, np.sin(4*np.pi*t))

multi = MultiCursor(fig.canvas, (ax1, ax2), color='r', lw=1,
                    horizOn=False, vertOn=True)
plt.show()
```

```
clear(event)
    clear the cursor

connect()
    connect events

disconnect()
    disconnect events

onmove(event)
```

```
class matplotlib.widgets.PolygonSelector(ax, onselect, useblit=False, line-
                                     props=None, markerprops=None, ver-
                                     tex_select_radius=15)
```

Bases: `matplotlib.widgets._SelectorWidget`

Select a polygon region of an axes.

Place vertices with each mouse click, and make the selection by completing the polygon (clicking on the first vertex). Hold the *ctrl* key and click and drag a vertex to reposition it (the *ctrl* key is not necessary if the polygon has already been completed). Hold the *shift* key and click and drag anywhere in the axes to move all vertices. Press the *esc* key to start a new polygon.

For the selector to remain responsive you must keep a reference to it.

### Parameters

**ax** [*Axes*] The parent axes for the widget.

**onselect** [function] When a polygon is completed or modified after completion, the *onselect* function is called and passed a list of the vertices as (xdata, ydata) tuples.

**useblit** [bool, optional]

**lineprops** [dict, optional] The line for the sides of the polygon is drawn with the properties given by *lineprops*. The default is `dict(color='k', linestyle='-', linewidth=2, alpha=0.5)`.

**markerprops** [dict, optional] The markers for the vertices of the polygon are drawn with the properties given by *markerprops*. The default is `dict(marker='o', markersize=7, mec='k', mfc='k', alpha=0.5)`.

**vertex\_select\_radius** [float, optional] A vertex is selected (to complete the polygon or to move a vertex) if the mouse click is within *vertex\_select\_radius* pixels of the vertex. The default radius is 15 pixels.

### Examples

```
/gallery/widgets/polygon_selector_demo
```

```
onmove(event)
```

Cursor move event handler and validator

```
verts
```

Get the polygon vertices.

### Returns

**list** A list of the vertices of the polygon as (xdata, ydata) tuples.

```
class matplotlib.widgets.RadioButtons(ax, labels, active=0, activecolor='blue')
```

Bases: `matplotlib.widgets.AxesWidget`

A GUI neutral radio button.

For the buttons to remain responsive you must keep a reference to this object.

The following attributes are exposed:

**ax** The `matplotlib.axes.Axes` instance the buttons are in

**activecolor** The color of the button when clicked  
**labels** A list of `matplotlib.text.Text` instances  
**circles** A list of `matplotlib.patches.Circle` instances  
**value\_selected** A string listing the current value selected

Connect to the RadioButtons with the `on_clicked()` method

Add radio buttons to `matplotlib.axes.Axes` instance `ax`

**labels** A len(buttons) list of labels as strings

**active** The index into labels for the button that is active

**activecolor** The color of the button when clicked

`disconnect(cid)`

remove the observer with connection id `cid`

`on_clicked(func)`

When the button is clicked, call `func` with button label

A connection id is returned which can be used to disconnect

`set_active(index)`

Trigger which radio button to make active.

**index is an index into the original label list** that this object was constructed with. Raise `ValueError` if the index is invalid.

Callbacks will be triggered if `eventson` is `True`.

```
class matplotlib.widgets.RectangleSelector(ax,          onselect,          drawtype='box',
                                           minspanx=None,      minspany=None,
                                           useblit=False,    lineprops=None,  rect-
                                           props=None,        spancoords='data',
                                           button=None,         maxdist=10,
                                           marker_props=None,  interactive=False,
                                           state_modifier_keys=None)
```

Bases: `matplotlib.widgets._SelectorWidget`

Select a rectangular region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.widgets import RectangleSelector

def onselect(eclick, erelease):
    "eclick and erelease are matplotlib events at press and release."
    print('startposition: (%f, %f)' % (eclick.xdata, eclick.ydata))
    print('endposition   : (%f, %f)' % (erelease.xdata, erelease.ydata))
    print('used button   : ', eclick.button)

def toggle_selector(event):
    print('Key pressed.')
    if event.key in ['Q', 'q'] and toggle_selector.RS.active:
        print('RectangleSelector deactivated.')
        toggle_selector.RS.set_active(False)
```

(continues on next page)

(continued from previous page)

```

if event.key in ['A', 'a'] and not toggle_selector.RS.active:
    print('RectangleSelector activated.')
    toggle_selector.RS.set_active(True)

x = np.arange(100.) / 99
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)

toggle_selector.RS = RectangleSelector(ax, onselect, drawtype='line')
fig.canvas.connect('key_press_event', toggle_selector)
plt.show()

```

Create a selector in *ax*. When a selection is made, clear the span and call *onselect* with:

```
onselect(pos_1, pos_2)
```

and clear the drawn box/line. The *pos\_1* and *pos\_2* are arrays of length 2 containing the x- and y-coordinate.

If *minspanx* is not *None* then events smaller than *minspanx* in x direction are ignored (it's the same for y).

The rectangle is drawn with *rectprops*; default:

```
rectprops = dict(facecolor='red', edgecolor = 'black',
                 alpha=0.2, fill=True)
```

The line is drawn with *lineprops*; default:

```
lineprops = dict(color='black', linestyle='-',
                 linewidth = 2, alpha=0.5)
```

Use *drawtype* if you want the mouse to draw a line, a box or nothing between click and actual position by setting

*drawtype* = 'line', *drawtype*='box' or *drawtype* = 'none'. Drawing a line would result in a line from vertex A to vertex C in a rectangle ABCD.

*spancoords* is one of 'data' or 'pixels'. If 'data', *minspanx* and *minspany* will be interpreted in the same coordinates as the x and y axis. If 'pixels', they are in pixels.

*button* is a list of integers indicating which mouse buttons should be used for rectangle selection. You can also specify a single integer if only a single button is desired. Default is *None*, which does not limit which button can be used.

**Note, typically:** 1 = left mouse button 2 = center mouse button (scroll wheel) 3 = right mouse button

*interactive* will draw a set of handles and allow you interact with the widget after it is drawn.

*state\_modifier\_keys* are keyboard modifiers that affect the behavior of the widget.

The defaults are: dict(move=' ', clear='escape', square='shift', center='ctrl')

Keyboard modifiers, which: 'move': Move the existing shape. 'clear': Clear the current shape. 'square': Makes the shape square. 'center': Make the initial point the center of the shape. 'square' and 'center' can be combined.

**center**  
Center of rectangle

**corners**  
Corners of rectangle from lower left, moving clockwise.

**draw\_shape**(*extents*)

**edge\_centers**  
Midpoint of rectangle edges from left, moving clockwise.

**extents**  
Return (xmin, xmax, ymin, ymax).

**geometry**  
Returns numpy.ndarray of shape (2,5) containing x (`RectangleSelector.geometry[1, :]`) and y (`RectangleSelector.geometry[0, :]`) coordinates of the four corners of the rectangle starting and ending in the top left corner.

```
class matplotlib.widgets.Slider(ax, label, valmin, valmax, valinit=0.5, valfmt='%1.2f',
                                closedmin=True, closedmax=True, slidermin=None,
                                slidermax=None, dragging=True, valstep=None,
                                **kwargs)
```

Bases: `matplotlib.widgets.AxesWidget`

A slider representing a floating point range.

Create a slider from *valmin* to *valmax* in axes *ax*. For the slider to remain responsive you must maintain a reference to it. Call `on_changed()` to connect to the slider event.

### Attributes

**val** [float] Slider value.

### Parameters

**ax** [Axes] The Axes to put the slider in.

**label** [str] Slider label.

**valmin** [float] The minimum value of the slider.

**valmax** [float] The maximum value of the slider.

**valinit** [float, optional, default: 0.5] The slider initial position.

**valfmt** [str, optional, default: "%1.2f"] Used to format the slider value, fprint format string.

**closedmin** [bool, optional, default: True] Indicate whether the slider interval is closed on the bottom.

**closedmax** [bool, optional, default: True] Indicate whether the slider interval is closed on the top.

**slidermin** [Slider, optional, default: None] Do not allow the current slider to have a value less than the value of the Slider `slidermin`.

**slidermax** [Slider, optional, default: None] Do not allow the current slider to have a value greater than the value of the Slider `slidermax`.

**dragging** [bool, optional, default: True] If True the slider can be dragged by the mouse.

**valstep** [float, optional, default: None] If given, the slider will snap to multiples of *valstep*.

### Notes

Additional kwargs are passed on to `self.poly` which is the *Rectangle* that draws the slider knob. See the *Rectangle* documentation for valid property names (e.g., *facecolor*, *edgecolor*, *alpha*).

`disconnect(cid)`

Remove the observer with connection id *cid*

### Parameters

**cid** [int] Connection id of the observer to be removed

`on_changed(func)`

When the slider value is changed call *func* with the new slider value

### Parameters

**func** [callable] Function to call when slider is changed. The function must accept a single float as its arguments.

### Returns

**cid** [int] Connection id (which can be used to disconnect *func*)

`reset()`

Reset the slider to the initial value

`set_val(val)`

Set slider value to *val*

### Parameters

**val** [float]

```
class matplotlib.widgets.SpanSelector(ax, onselect, direction, minspan=None,
                                     useblit=False, rectprops=None, on-
                                     move_callback=None, span_stays=False, but-
                                     ton=None)
```

Bases: `matplotlib.widgets._SelectorWidget`

Visually select a min/max range on a single axis and call a function with those values.

To guarantee that the selector remains responsive, keep a reference to it.

In order to turn off the `SpanSelector`, set `span_selector.active=False`. To turn it back on, set `span_selector.active=True`.

### Parameters

**ax** [*matplotlib.axes.Axes* object]

**onselect** [func(min, max), min/max are floats]

**direction** ["horizontal" or "vertical"] The axis along which to draw the span selector

**minspan** [float, default is None] If selection is less than *minspan*, do not call *onselect*

**useblit** [bool, default is False] If True, use the backend-dependent blitting features for faster canvas updates.

**rectprops** [dict, default is None] Dictionary of `matplotlib.patches.Patch` properties

**onmove\_callback** [func(min, max), min/max are floats, default is None] Called on mouse move while the span is being selected

**span\_stays** [bool, default is False] If True, the span stays visible after the mouse is released

**button** [int or list of ints]

**Determines which mouse buttons activate the span selector** 1

= left mouse button

2 = center mouse button (scroll wheel)

3 = right mouse button

### Examples

```
>>> import matplotlib.pyplot as plt
>>> import matplotlib.widgets as mwidgets
>>> fig, ax = plt.subplots()
>>> ax.plot([1, 2, 3], [10, 50, 100])
>>> def onselect(vmin, vmax):
...     print(vmin, vmax)
>>> rectprops = dict(facecolor='blue', alpha=0.5)
>>> span = mwidgets.SpanSelector(ax, onselect, 'horizontal',
...                             rectprops=rectprops)
...
>>> fig.show()
```

See also: [/gallery/widgets/span\\_selector](/gallery/widgets/span_selector)

`ignore(event)`  
return *True* if *event* should be ignored

`new_axes(ax)`  
Set `SpanSelector` to operate on a new `Axes`

`class matplotlib.widgets.SubplotTool(targetfig, toolfig)`  
Bases: `matplotlib.widgets.Widget`

A tool to adjust the subplot params of a `matplotlib.figure.Figure`.

**targetfig** The figure instance to adjust.

**toolfig** The figure instance to embed the subplot tool into. If *None*, a default figure will be created. If you are using this from the GUI

`funcbottom(val)`

`funcspace(val)`

`funcleft(val)`

`funcright(val)`

`functop(val)`

`funcwspace(val)`

```
class matplotlib.widgets.TextBox(ax, label, initial="", color='.95', hovercolor='1', label_pad=0.01)
```

Bases: `matplotlib.widgets.AxesWidget`

A GUI neutral text input box.

For the text box to remain responsive you must keep a reference to it.

The following attributes are accessible:

**ax** The `matplotlib.axes.Axes` the button renders into.

**label** A `matplotlib.text.Text` instance.

**color** The color of the text box when not hovering.

**hovercolor** The color of the text box when hovering.

Call `on_text_change()` to be updated whenever the text changes.

Call `on_submit()` to be updated whenever the user hits enter or leaves the text entry field.

### Parameters

**ax** [`matplotlib.axes.Axes`] The `matplotlib.axes.Axes` instance the button will be placed into.

**label** [`str`] Label for this text box. Accepts string.

**initial** [`str`] Initial value in the text box

**color** [`color`] The color of the box

**hovercolor** [`color`] The color of the box when the mouse is over it

**label\_pad** [`float`] the distance between the label and the right side of the textbox

`begin_typing(x)`

`disconnect(cid)`

Remove the observer with connection id `cid`.

`on_submit(func)`

When the user hits enter or leaves the submission box, call this `func` with event.

A connection id is returned which can be used to disconnect.

`on_text_change(func)`

When the text changes, call this `func` with event.

A connection id is returned which can be used to disconnect.

`position_cursor(x)`

`set_val(val)`

`stop_typing()`

```
class matplotlib.widgets.ToolHandles(ax, x, y, marker='o', marker_props=None, useblit=True)
```

Bases: `object`

Control handles for canvas tools.

### Parameters

**ax** [`matplotlib.axes.Axes`] Matplotlib axes where tool handles are displayed.

**x, y** [1D arrays] Coordinates of control handles.

**marker** [str] Shape of marker used to display handle. See *matplotlib.pyplot.plot*.

**marker\_props** [dict] Additional marker properties. See *matplotlib.lines.Line2D*.

`closest(x, y)`

Return index and pixel distance to closest index.

`set_animated(val)`

`set_data(pts, y=None)`

Set x and y positions of handles

`set_visible(val)`

`x`

`y`

`class matplotlib.widgets.Widget`

Bases: `object`

Abstract base class for GUI neutral widgets

`active`

Is the widget active?

`drawon = True`

`eventson = True`

`get_active()`

Get whether the widget is active.

`ignore(event)`

Return True if event should be ignored.

This method (or a version of it) should be called at the beginning of any event callback.

`set_active(active)`

Set whether the widget is active.

## 19.1 Toolkits

Toolkits are collections of application-specific functions that extend Matplotlib.

### 19.1.1 mplot3d

`mpl_toolkits.mplot3d` provides some basic 3D plotting (scatter, surf, line, mesh) tools. Not the fastest or most feature complete 3D library out there, but it ships with Matplotlib and thus may be a lighter weight solution for some use cases. Check out the [mplot3d tutorial](#) for more information.

Fig. 1: Contourf3d 2

### `mplot3d`

#### Matplotlib `mplot3d` toolkit

The `mplot3d` toolkit adds simple 3D plotting capabilities to matplotlib by supplying an axes object that can create a 2D projection of a 3D scene. The resulting graph will have the same look and feel as regular 2D plots.

See the [mplot3d tutorial](#) for more information on how to use this toolkit.

The interactive backends also provide the ability to rotate and zoom the 3D scene. One can rotate the 3D scene by simply clicking-and-dragging the scene. Zooming is done by right-clicking the scene and dragging the mouse up and down. Note that one does not use the zoom button like one would use for regular 2D plots.

### **mplot3d FAQ**

#### **How is mplot3d different from MayaVi?**

[MayaVi2](#) is a very powerful and featureful 3D graphing library. For advanced 3D scenes and excellent rendering capabilities, it is highly recommended to use MayaVi2.

mplot3d was intended to allow users to create simple 3D graphs with the same “look-and-feel” as matplotlib’s 2D plots. Furthermore, users can use the same toolkit that they are already familiar with to generate both their 2D and 3D plots.

#### **My 3D plot doesn’t look right at certain viewing angles**

This is probably the most commonly reported issue with mplot3d. The problem is that - from some viewing angles - a 3D object would appear in front of another object, even though it is physically behind it. This can result in plots that do not look “physically correct.”

Unfortunately, while some work is being done to reduce the occurrence of this artifact, it is currently an intractable problem, and can not be fully solved until matplotlib supports 3D

graphics rendering at its core.

The problem occurs due to the reduction of 3D data down to 2D + z-order scalar. A single value represents the 3rd dimension for all parts of 3D objects in a collection. Therefore, when the bounding boxes of two collections intersect, it becomes possible for this artifact to occur. Furthermore, the intersection of two 3D objects (such as polygons or patches) can not be rendered properly in matplotlib's 2D rendering engine.

This problem will likely not be solved until OpenGL support is added to all of the backends (patches are greatly welcomed). Until then, if you need complex 3D scenes, we recommend using [MayaVi](#).

### I don't like how the 3D plot is laid out, how do I change that?

Historically, mplot3d has suffered from a hard-coding of parameters used to control visuals such as label spacing, tick length, and grid line width. Work is being done to eliminate this issue. For matplotlib v1.1.0, there is a semi-official manner to modify these parameters. See the note in the [axis3d](#) section of the mplot3d API documentation for more information.

## 19.1.2 Matplotlib axes\_grid1 Toolkit

The matplotlib `mpl_toolkits.axes_grid1` toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the `aspect` parameter in matplotlib adjust the position of the single axes, `axes_grid1` toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See [What is axes\\_grid1 toolkit?](#) for a guide on the usage of `axes_grid1`.

### The submodules of the axes\_grid1 API are:

---

`axes_grid1.anchored_artists`

---

`axes_grid1.axes_divider`

The `axes_divider` module provides helper classes to adjust the positions of multiple axes at drawing time.

---

`axes_grid1.axes_grid`

---

`axes_grid1.axes_rgb`

Continued on next page

Table 1 – continued from previous page

<code>axes_grid1.axes_size</code>	provides a classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes.
<code>axes_grid1.colorbar</code>	Colorbar toolkit with two classes and a function:
<code>axes_grid1.inset_locator</code>	A collection of functions and objects for creating or placing inset axes.
<code>axes_grid1.mpl_axes</code>	
<code>axes_grid1.parasite_axes</code>	

`mpl_toolkits.axes_grid1.anchored_artists`

Classes

<code>AnchoredAuxTransformBox(transform, loc[, ...])</code>	An anchored container with transformed coordinates.
<code>AnchoredDirectionArrows(transform, label_x, ...)</code>	Draw two perpendicular arrows to indicate directions.
<code>AnchoredDrawingArea(width, height, xdescent, ...)</code>	An anchored container with a fixed size and fillable DrawingArea.
<code>AnchoredEllipse(transform, width, height, ...)</code>	Draw an anchored ellipse of a given size.
<code>AnchoredSizeBar(transform, size, label, loc)</code>	Draw a horizontal scale bar with a center-aligned label underneath.

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox`

```
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox(transform,
                                                                    loc, pad=0.4,
                                                                    border-
                                                                    pad=0.5,
                                                                    prop=None,
                                                                    frameon=True,
                                                                    **kwargs)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

An anchored container with transformed coordinates.

Artists added to the *drawing\_area* are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

**Parameters**

**transform** [`matplotlib.transforms.Transform`] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

**loc** [int] Location of this artist. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
```

(continues on next page)

(continued from previous page)

```
'right'      : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'      : 10
```

**pad** [int or float, optional] Padding around the child objects, in fraction of the font size. Defaults to 0.4.

**borderpad** [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.5.

**prop** [*matplotlib.font\_manager.FontProperties*, optional] Font property used as a reference for paddings.

**frameon** [bool, optional] If True, draw a box around this artists. Defaults to True.

**\*\*kwargs** : Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0,0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

## Attributes

**drawing\_area** [*matplotlib.offsetbox.AuxTransformBox*] A container for artists to display.

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox`

- sphx\_glr\_gallery\_userdemo\_anchored\_box03.py

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows`

```
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows(transform, label_x, label_y,
length=0.15,
font-size=0.08,
loc=2, angle=0, aspect_ratio=1,
pad=0.4, borderpad=0.4,
frameon=False,
color='w',
alpha=1,
sep_x=0.01,
sep_y=0,
fontproperties=None,
back_length=0.15,
head_width=10,
head_length=15,
tail_width=2,
text_props=None,
arrow_props=None,
**kwargs)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

Draw two perpendicular arrows to indicate directions.

**Parameters**

**transform** [`matplotlib.transforms.Transform`] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transAxes`.

**label\_x, label\_y** [string] Label text for the x and y arrows

**length** [int or float, optional] Length of the arrow, given in coordinates of `transform`. Defaults to 0.15.

**fontsize** [int, optional] Size of label strings, given in coordinates of `transform`. Defaults to 0.08.

**loc** [int, optional] Location of the direction arrows. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

Defaults to 2.

**angle** [int or float, optional] The angle of the arrows in degrees. Defaults to 0.

**aspect\_ratio** [int or float, optional] The ratio of the length of arrow `x` and arrow `y`. Negative numbers can be used to change the direction. Defaults to 1.

**pad** [int or float, optional] Padding around the labels and arrows, in fraction of the font size. Defaults to 0.4.

**borderpad** [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.4.

**frameon** [bool, optional] If True, draw a box around the arrows and labels. Defaults to False.

**color** [str, optional] Color for the arrows and labels. Defaults to white.

**alpha** [int or float, optional] Alpha values of the arrows and labels Defaults to 1.

**sep\_x, sep\_y** [int or float, optional] Separation between the arrows and labels in coordinates of *transform*. Defaults to 0.01 and 0.

**fontproperties** [*matplotlib.font\_manager.FontProperties*, optional] Font properties for the label text.

**back\_length** [float, optional] Fraction of the arrow behind the arrow crossing. Defaults to 0.15.

**head\_width** [int or float, optional] Width of arrow head, sent to ArrowStyle. Defaults to 10.

**head\_length** [int or float, optional] Length of arrow head, sent to ArrowStyle. Defaults to 15.

**tail\_width** [int or float, optional] Width of arrow tail, sent to ArrowStyle. Defaults to 2.

**text\_props, arrow\_props** [dict] Properties of the text and arrows, passed to `matplotlib.text.TextPath` and `matplotlib.patches.FancyArrowPatch`

**\*\*kwargs** : Keyworded arguments to pass to `matplotlib.offsetbox.AnchoredOffsetbox`.

## Notes

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

## Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
```

(continues on next page)

(continued from previous page)

```

...     AnchoredDirectionArrows)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10,10)))
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()

```

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```

>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
...                                 loc='lower left', color='k',
...                                 aspect_ratio=-1, sep_x=0.02,
...                                 sep_y=-0.01,
...                                 text_props={'ec':'w', 'fc':'k'},
...                                 fontproperties=fontprops)

```

### Attributes

**arrow\_x, arrow\_y** [*matplotlib.patches.FancyArrowPatch*] Arrow x and y

**text\_path\_x, text\_path\_y** [*matplotlib.text.TextPath*] Path for arrow labels

**p\_x, p\_y** [*matplotlib.patches.PathPatch*] Patch for arrow labels

**box** [*matplotlib.offsetbox.AuxTransformBox*] Container for the arrows and labels.

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows`

- `sphx_glr_gallery_axes_grid1_demo_anchored_direction_arrows.py`

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea`

```

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea(width, height,
                                                                    xdescent, ydescent,
                                                                    loc,
                                                                    pad=0.4, borderpad=0.5,
                                                                    prop=None,
                                                                    frameon=True,
                                                                    **kwargs)

```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

An anchored container with a fixed size and fillable `DrawingArea`.

Artists added to the `drawing_area` will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

### Parameters

**width, height** [int or float] width and height of the container, in pixels.

**xdescent, ydescent** [int or float] descent of the container in the x- and y-direction, in pixels.

**loc** [int] Location of this artist. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**pad** [int or float, optional] Padding around the child objects, in fraction of the font size. Defaults to 0.4.

**borderpad** [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.5.

**prop** [*matplotlib.font\_manager.FontProperties*, optional] Font property used as a reference for paddings.

**frameon** [bool, optional] If True, draw a box around this artists. Defaults to True.

**\*\*kwargs** : Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Examples

To display blue and red circles of different sizes in the upper right of an axes *ax*:

```
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                           loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

## Attributes

**drawing\_area** [*matplotlib.offsetbox.DrawingArea*] A container for artists to display.

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea`

- sphx\_glr\_gallery\_axes\_grid1\_simple\_anchored\_artists.py
- sphx\_glr\_gallery\_userdemo\_anchored\_box02.py

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse`

```
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse(transform, width,
                                                                height, angle, loc,
                                                                pad=0.1, border-
                                                                pad=0.1, prop=None,
                                                                frameon=True,
                                                                **kwargs)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

Draw an anchored ellipse of a given size.

**Parameters**

**transform** [`matplotlib.transforms.Transform`] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

**width, height** [int or float] Width and height of the ellipse, given in coordinates of *transform*.

**angle** [int or float] Rotation of the ellipse, in degrees, anti-clockwise.

**loc** [int] Location of this size bar. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**pad** [int or float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.

**borderpad** [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.1.

**frameon** [bool, optional] If True, draw a box around the ellipse. Defaults to True.

**prop** [`matplotlib.font_manager.FontProperties`, optional] Font property used as a reference for paddings.

**\*\*kwargs**: Keyworded arguments to pass to `matplotlib.offsetbox.AnchoredOffsetbox`.

**Attributes**

**ellipse** [`matplotlib.patches.Ellipse`] Ellipse patch drawn.

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse`

- `sphinx_glr_gallery_axes_grid1_simple_anchored_artists.py`

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar`

```
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar(transform, size, label,
                                                                loc, pad=0.1, border-
                                                                pad=0.1, sep=2,
                                                                frameon=True,
                                                                size_vertical=0,
                                                                color='black', la-
                                                                bel_top=False, font-
                                                                properties=None,
                                                                fill_bar=None,
                                                                **kwargs)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

Draw a horizontal scale bar with a center-aligned label underneath.

**Parameters**

**transform** [`matplotlib.transforms.Transform`] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

**size** [int or float] Horizontal length of the size bar, given in coordinates of *transform*.

**label** [str] Label to display.

**loc** [int] Location of this size bar. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**pad** [int or float, optional] Padding around the label and size bar, in fraction of the font size. Defaults to 0.1.

**borderpad** [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.1.

**sep** [int or float, optional] Separation between the label and the size bar, in points. Defaults to 2.

**frameon** [bool, optional] If True, draw a box around the horizontal bar and label. Defaults to True.

**size\_vertical** [int or float, optional] Vertical length of the size bar, given in coordinates of *transform*. Defaults to 0.

**color** [str, optional] Color for the size bar and label. Defaults to black.

**label\_top** [bool, optional] If True, the label will be over the size bar. Defaults to False.

**fontproperties** [`matplotlib.font_manager.FontProperties`, optional] Font properties for the label text.

**fill\_bar** [bool, optional] If True and if `size_vertical` is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if `size_vertical` is greater than zero and False otherwise.

**\*\*kwargs**: Keyworded arguments to pass to `matplotlib.offsetbox.AnchoredOffsetbox`.

### Notes

If `prop` is passed as a keyworded argument, but `fontproperties` is not, then `prop` is assumed to be the intended `fontproperties`. Using both `prop` and `fontproperties` is not supported.

### Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10,10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

### Using all the optional parameters

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
...                       sep=5, borderpad=0.5, frameon=False,
...                       size_vertical=0.5, color='white',
...                       fontproperties=fontprops)
```

### Attributes

**size\_bar** [`matplotlib.offsetbox.AuxTransformBox`] Container for the size bar.

**txt\_label** [`matplotlib.offsetbox.TextArea`] Container for the label of the size bar.

### Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar`

- `sphinx_glr_gallery_axes_grid1_inset_locator_demo2.py`
- `sphinx_glr_gallery_axes_grid1_simple_anchored_artists.py`

### `mpl_toolkits.axes_grid1.axes_divider`

The `axes_divider` module provides helper classes to adjust the positions of multiple axes at drawing time.

**Divider:** this is the class that is used to calculate the axes position. It divides the given rectangular area into several sub rectangles. You initialize the divider by setting the horizontal and vertical lists of sizes that the division will be based on. You then use the `new_locator` method, whose return value is a callable object that can be used to set the `axes_locator` of the axes.

## Classes

<code>Axes(**kwargs)</code>	Deprecated since version 3.0.
<code>AxesDivider(axes[, xref, yref])</code>	Divider based on the pre-existing axes.
<code>AxesLocator(axes_divider, nx, ny[, nx1, ny1])</code>	A simple callable object, initialized with <code>AxesDivider</code> class, returns the position and size of the given cell.
<code>Divider(fig, pos, horizontal, vertical[, ...])</code>	This class calculates the axes position.
<code>HBoxDivider(fig, *args, **kwargs)</code>	
<code>LocatableAxes(**kwargs)</code>	Deprecated since version 3.0.
<code>LocatableAxesBase(**kwargs)</code>	Deprecated since version 3.0.
<code>SubplotDivider(fig, *args[, horizontal, ...])</code>	The <code>Divider</code> class whose rectangle area is specified as a subplot geometry.
<code>VBoxDivider(fig, *args, **kwargs)</code>	The <code>Divider</code> class whose rectangle area is specified as a subplot geometry.

### `mpl_toolkits.axes_grid1.axes_divider.Axes`

```
class mpl_toolkits.axes_grid1.axes_divider.Axes(**kwargs)
    Bases: mpl_toolkits.axes_grid1.mpl_axes.Axes
```

Deprecated since version 3.0: The `Axes` class was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use `mpl_toolkits.axes_grid1.mpl_axes.Axes` instead.

### `mpl_toolkits.axes_grid1.axes_divider.AxesDivider`

```
class mpl_toolkits.axes_grid1.axes_divider.AxesDivider(axes, xref=None, yref=None)
    Bases: mpl_toolkits.axes_grid1.axes_divider.Divider
```

Divider based on the pre-existing axes.

#### Parameters

**axes** [`Axes`]

**xref**

**yref**

```
append_axes(position, size, pad=None, add_to_figure=True, **kwargs)
```

create an axes at the given `position` with the same height (or width) of the main axes.

**position** ["left"|"right"|"bottom"|"top"]

*size* and *pad* should be `axes_grid.axes_size` compatible.

```
get_anchor()
    return the anchor

get_aspect()
    return aspect

get_position()
    return the position of the rectangle.

get_subplotspec()

new_horizontal(size, pad=None, pack_start=False, **kwargs)
    Add a new axes on the right (or left) side of the main axes.
```

#### Parameters

**size** [`axes_size` or float or string] A width of the axes. If float or string is given, *from\_any* function is used to create the size, with *ref\_size* set to `AxesX` instance of the current axes.

**pad** [`axes_size` or float or string] Pad between the axes. It takes same argument as *size*.

**pack\_start** [bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

**kwargs** All extra keywords arguments are passed to the created axes. If *axes\_class* is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

```
new_vertical(size, pad=None, pack_start=False, **kwargs)
    Add a new axes on the top (or bottom) side of the main axes.
```

#### Parameters

**size** [`axes_size` or float or string] A height of the axes. If float or string is given, *from\_any* function is used to create the size, with *ref\_size* set to `AxesX` instance of the current axes.

**pad** [`axes_size` or float or string] Pad between the axes. It takes same argument as *size*.

**pack\_start** [bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

**kwargs** All extra keywords arguments are passed to the created axes. If *axes\_class* is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

#### `mpl_toolkits.axes_grid1.axes_divider.AxesLocator`

```
class mpl_toolkits.axes_grid1.axes_divider.AxesLocator(axes_divider, nx, ny,
                                                       nx1=None, ny1=None)
    Bases: object
```

A simple callable object, initialized with AxesDivider class, returns the position and size of the given cell.

### Parameters

**axes\_divider** [AxesDivider]

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

`get_subplotspec()`

### `mpl_toolkits.axes_grid1.axes_divider.Divider`

```
class mpl_toolkits.axes_grid1.axes_divider.Divider(fig, pos, horizontal, vertical, aspect=None, anchor='C')
```

Bases: `object`

This class calculates the axes position. It divides the given rectangular area into several sub-rectangles. You initialize the divider by setting the horizontal and vertical lists of sizes (`mpl_toolkits.axes_grid.axes_size`) that the division will be based on. You then use the `new_locator` method to create a callable object that can be used as the `axes_locator` of the axes.

### Parameters

**fig** [Figure]

**pos** [tuple of 4 floats] position of the rectangle that will be divided

**horizontal** [list of `axes_size`] sizes for horizontal division

**vertical** [list of `axes_size`] sizes for vertical division

**aspect** [bool] if True, the overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

**anchor** [{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}] placement of the reduced rectangle when *aspect* is True

`add_auto_adjustable_area(use_axes, pad=0.1, adjust_dirs=None)`

`append_size(position, size)`

`get_anchor()`  
return the anchor

`get_aspect()`  
return aspect

`get_horizontal()`  
return horizontal sizes

`get_horizontal_sizes(renderer)`

`get_locator()`

`get_position()`  
return the position of the rectangle.

`get_position_runtime(ax, renderer)`

`get_vertical()`  
return vertical sizes

`get_vertical_sizes(renderer)`

`get_vsize_hsize()`

`locate(nx, ny, nx1=None, ny1=None, axes=None, renderer=None)`

#### Parameters

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

**axes**

**renderer**

`new_locator(nx, ny, nx1=None, ny1=None)`

Returns a new locator (`mpl_toolkits.axes_grid.axes_divider.AxesLocator`) for specified cell.

#### Parameters

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

`set_anchor(anchor)`

#### Parameters

**anchor** [{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}]

anchor position

value	description
'C'	Center
'SW'	bottom left
'S'	bottom
'SE'	bottom right
'E'	right
'NE'	top right
'N'	top
'NW'	top left
'W'	left

`set_aspect(aspect=False)`

#### Parameters

**aspect** [bool]

`set_horizontal(h)`

**Parameters****h** [list of axes\_size] sizes for horizontal division`set_locator(locator)``set_position(pos)`

set the position of the rectangle.

**Parameters****pos** [tuple of 4 floats] position of the rectangle that will be divided`set_vertical(v)`**Parameters****v** [list of axes\_size] sizes for vertical division**`mpl_toolkits.axes_grid1.axes_divider.HBoxDivider`**`class mpl_toolkits.axes_grid1.axes_divider.HBoxDivider(fig, *args, **kwargs)`Bases: `mpl_toolkits.axes_grid1.axes_divider.SubplotDivider``locate(nx, ny, nx1=None, ny1=None, axes=None, renderer=None)`**Parameters****axes\_divider** [AxesDivider]**nx**, **nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.**ny**, **ny1** [int] Same as *nx* and *nx1*, but for row positions.**axes****renderer**`new_locator(nx, nx1=None)`returns a new locator (`mpl_toolkits.axes_grid1.axes_divider.AxesLocator`) for specified cell.**Parameters****nx**, **nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.**ny**, **ny1** [int] Same as *nx* and *nx1*, but for row positions.**Examples using `mpl_toolkits.axes_grid1.axes_divider.HBoxDivider`**

- `sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py`

**mpl\_toolkits.axes\_grid1.axes\_divider.LocatableAxes**

```
class mpl_toolkits.axes_grid1.axes_divider.LocatableAxes(**kwargs)
    Bases: mpl_toolkits.axes_grid1.mpl_axes.Axes
```

Deprecated since version 3.0: The LocatableAxes class was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use `mpl_toolkits.axes_grid1.mpl_axes.Axes` instead.

**mpl\_toolkits.axes\_grid1.axes\_divider.LocatableAxesBase**

```
class mpl_toolkits.axes_grid1.axes_divider.LocatableAxesBase(**kwargs)
    Bases: object
```

Deprecated since version 3.0: The LocatableAxesBase class was deprecated in Matplotlib 3.0 and will be removed in 3.2. There is no alternative. Deriving from `matplotlib.axes.Axes` provides this functionality already.

**mpl\_toolkits.axes\_grid1.axes\_divider.SubplotDivider**

```
class mpl_toolkits.axes_grid1.axes_divider.SubplotDivider(fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')
    Bases: mpl_toolkits.axes_grid1.axes_divider.Divider
```

The Divider class whose rectangle area is specified as a subplot geometry.

**Parameters**

**fig** [*matplotlib.figure.Figure*]

**args** [tuple (*numRows*, *numCols*, *plotNum*)] The array of subplots in the figure has dimensions *numRows*, *numCols*, and *plotNum* is the number of the subplot being created. *plotNum* starts at 1 in the upper left corner and increases to the right.

If  $numRows \leq numCols \leq plotNum < 10$ , *args* can be the decimal integer  $numRows * 100 + numCols * 10 + plotNum$ .

```
change_geometry(numrows, numcols, num)
    change subplot geometry, e.g., from 1,1,1 to 2,2,3
```

```
get_geometry()
    get the subplot geometry, e.g., 2,2,3
```

```
get_position()
    return the bounds of the subplot box
```

```
get_subplotspec()
    get the SubplotSpec instance
```

```
set_subplotspec(subplotspec)
    set the SubplotSpec instance
```

```
update_params()
    update the subplot position from fig.subplotpars
```

**mpl\_toolkits.axes\_grid1.axes\_divider.VBoxDivider**

```
class mpl_toolkits.axes_grid1.axes_divider.VBoxDivider(fig, *args, **kwargs)
```

Bases: *mpl\_toolkits.axes\_grid1.axes\_divider.HBoxDivider*

The Divider class whose rectangle area is specified as a subplot geometry.

```
locate(nx, ny, nx1=None, ny1=None, axes=None, renderer=None)
```

**Parameters**

**axes\_divider** [AxesDivider]

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

**axes**

**renderer**

```
new_locator(ny, ny1=None)
```

returns a new locator (*mpl\_toolkits.axes\_grid1.axes\_divider.AxesLocator*) for specified cell.

**Parameters**

**ny, ny1** [int] Integers specifying the row-position of the cell. When *ny1* is None, a single *ny*-th row is specified. Otherwise location of rows spanning between *ny* to *ny1* (but excluding *ny1*-th row) is specified.

**Functions**

---

<i>locatable_axes_factory</i> ( <i>axes_class</i> )	Deprecated since version 3.0.
---	-------------------------------

<i>CbarAxes</i> (*args, orientation, **kwargs)	
<i>CbarAxesBase</i>	
<i>Grid</i> (fig, rect, nrows_ncols[, ngrids, ...])	A class that creates a grid of Axes.
<i>ImageGrid</i> (fig, rect, nrows_ncols[, ngrids, ...])	A class that creates a grid of Axes.

`mpl_toolkits.axes_grid1.axes_grid.AxesGrid`

`mpl_toolkits.axes_grid1.axes_grid.AxesGrid`  
 alias of `mpl_toolkits.axes_grid1.axes_grid.ImageGrid`

`mpl_toolkits.axes_grid1.axes_grid.CbarAxes`

```
class mpl_toolkits.axes_grid1.axes_grid.CbarAxes(*args, orientation, **kwargs)
    Bases: mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase, mpl_toolkits.axes_grid1.mpl_axes.Axes
    cla()
        Clear the current axes.
```

`mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase`

```
class mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase
    Bases: object
    colorbar(mappable, *, locator=None, **kwargs)
    toggle_label(b)
```

`mpl_toolkits.axes_grid1.axes_grid.Grid`

```
class mpl_toolkits.axes_grid1.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None,
                                             direction='row', axes_pad=0.02,
                                             add_all=True, share_all=False,
                                             share_x=True, share_y=True, label_mode='L', axes_class=None)
```

Bases: `object`

A class that creates a grid of Axes. In matplotlib, the axes location (and size) is specified in the normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio. For example, displaying images of a same size with some fixed padding between them cannot be easily done in matplotlib. AxesGrid is used in such case.

Build an *Grid* instance with a grid *nrows\*ncols* *Axes* in *Figure fig* with *rect=[left, bottom, width, height]* (in *Figure* coordinates) or the subplot position code (e.g., "121").

Optional keyword arguments:

Key-word	De-fault	Description
<code>direction</code>	"row"	[ "row"   "column" ]
<code>axes_pad</code>	0.02	float  pad between axes given in inches or tuple-like of floats, (horizontal padding, vertical padding)
<code>add_all</code>	True	bool
<code>share_all</code>	False	bool
<code>share_x</code>	True	bool
<code>share_y</code>	True	bool
<code>label_mode</code>	"L"	[ "L"   "1"   "all" ]
<code>axes_class</code>	None	a type object which must be a subclass of <i>Axes</i>

```
get_aspect()
    get aspect
```

```
get_axes_locator()
```

```
get_axes_pad()
    get axes_pad
```

### Returns

**tuple** Padding in inches, (horizontal pad, vertical pad)

```
get_divider()
```

```
get_geometry()
    get geometry of the grid. Returns a tuple of two integer, representing number of
    rows and number of columns.
```

```
get_vsize_hsize()
```

```
set_aspect(aspect)
    set aspect
```

```
set_axes_locator(locator)
```

```

set_axes_pad(axes_pad)
    set axes_pad

set_label_mode(mode)
    set label_mode
    
```

**mpl\_toolkits.axes\_grid1.axes\_grid.ImageGrid**

```

class mpl_toolkits.axes_grid1.axes_grid.ImageGrid(fig, rect, nrows_ncols,
                                                    ngrids=None, direction='row',
                                                    axes_pad=0.02, add_all=True,
                                                    share_all=False, aspect=True, label_mode='L',
                                                    cbar_mode=None, cbar_location='right',
                                                    cbar_pad=None, cbar_size='5%',
                                                    cbar_set_cax=True,
                                                    axes_class=None)
    
```

Bases: `mpl_toolkits.axes_grid1.axes_grid.Grid`

A class that creates a grid of Axes. In matplotlib, the axes location (and size) is specified in the normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio. For example, displaying images of a same size with some fixed padding between them cannot be easily done in matplotlib. ImageGrid is used in such case.

Build an `ImageGrid` instance with a grid `nrows*ncols` *Axes* in *Figure fig* with `rect=[left, bottom, width, height]` (in *Figure* coordinates) or the subplot position code (e.g., "121").

Optional keyword arguments:

Keyword	De- fault	Description
direction	"row"	[ "row"   "column" ]
axes_pad	0.02	float  pad between axes given in inches or tuple-like of floats, (horizontal padding, vertical padding)
add_all	True	bool
share_all	False	bool
aspect	True	bool
label_mode	"L"	[ "L"   "1"   "all" ]
cbar_mode	None	[ "each"   "single"   "edge" ]
cbar_location	"right"	[ "left"   "right"   "bottom"   "top" ]
cbar_pad	None	
cbar_size	"5%"	
cbar_set_cax	True	bool
axes_class	None	a type object which must be a subclass of axes_grid's subclass of <i>Axes</i>

**cbar\_set\_cax** [if True, each axes in the grid has a `cax`] attribute that is bind to associated `cbar_axes`.

`mpl_toolkits.axes_grid1.axes_rgb`

## Classes

---

`RGBAxes(*args[, pad, add_all])`

### Parameters

---

`RGBAxesBase(*args[, pad, add_all])`

base class for a 4-panel imshow (RGB, R, G, B)

---

`mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

```
class mpl_toolkits.axes_grid1.axes_rgb.RGBAxes(*args, pad=0, add_all=True, **kwargs)
    Bases: mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase
```

### Parameters

- pad** [float] fraction of the axes height to put as padding. defaults to 0.0
- add\_all** [bool] True: Add the {rgb, r, g, b} axes to the figure defaults to True.
- axes\_class** [matplotlib.axes.Axes]
- kl** : Unpacked into axes\_class() init for RGB
- kwargs** : Unpacked into axes\_class() init for RGB, R, G, B axes

Examples using `mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

- `sphx_glr_gallery_pyplots_whats_new_99_axes_grid.py`
- `sphx_glr_gallery_axes_grid1_demo_axes_rgb.py`
- `sphx_glr_gallery_axes_grid1_simple_rgb.py`

`mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase`

```
class mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase(*args, pad=0, add_all=True,
                                                    **kwargs)
```

Bases: `object`

base class for a 4-panel imshow (RGB, R, G, B)

Layout: +-----+---+ || R | + +---+ | RGB | G | + +---+ || B | +-----+---+

### Attributes

- \_defaultAxesClass** [matplotlib.axes.Axes] defaults to 'Axes' in RGBAxes child class. No default in abstract base class
- RGB** [\_defaultAxesClass] The axes object for the three-channel imshow
- R** [\_defaultAxesClass] The axes object for the red channel imshow
- G** [\_defaultAxesClass] The axes object for the green channel imshow
- B** [\_defaultAxesClass] The axes object for the blue channel imshow

**Parameters**

- pad** [float] fraction of the axes height to put as padding. defaults to 0.0
- add\_all** [bool] True: Add the {rgb, r, g, b} axes to the figure defaults to True.
- axes\_class** [matplotlib.axes.Axes]
- kl** : Unpacked into axes\_class() init for RGB
- kwargs** : Unpacked into axes\_class() init for RGB, R, G, B axes

`add_RGB_to_figure()`

Add the red, green and blue axes to the RGB composite's axes figure

`imshow_rgb(r, g, b, **kwargs)`

Create the four images {rgb, r, g, b}

**Parameters**

- r** [array-like] The red array
- g** [array-like] The green array
- b** [array-like] The blue array
- kwargs** [imshow kwargs] kwargs get unpacked into the imshow calls for the four images

**Returns**

- rgb** [matplotlib.image.AxesImage]
- r** [matplotlib.image.AxesImage]
- g** [matplotlib.image.AxesImage]
- b** [matplotlib.image.AxesImage]

**Functions**

---

`imshow_rgb(ax, r, g, b, **kwargs)`

`make_rgb_axes(ax[, pad, axes_class, add_all])` pad : fraction of the axes height.

---

`mpl_toolkits.axes_grid1.axes_rgb.imshow_rgb`

`mpl_toolkits.axes_grid1.axes_rgb.imshow_rgb(ax, r, g, b, **kwargs)`

`mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes`

`mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes(ax, pad=0.01, axes_class=None, add_all=True)`  
pad : fraction of the axes height.

Examples using `mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes`

- `sphinx_glr_gallery_axes_grid1_demo_axes_rgb.py`

`mpl_toolkits.axes_grid1.axes_size`

provides a classes of simple units that will be used with `AxesDivider` class (or others) to determine the size of each axes. The unit classes define `get_size` method that returns a tuple of two floats, meaning relative and absolute sizes, respectively.

Note that this class is nothing more than a simple tuple of two floats. Take a look at the `Divider` class to see how these two values are used.

## Classes

<code>Add(a, b)</code>	
<code>AddList(add_list)</code>	
<code>AxesX(axes[, aspect, ref_ax])</code>	Scaled size whose relative part corresponds to the data width of the <i>axes</i> multiplied by the <i>aspect</i> .
<code>AxesY(axes[, aspect, ref_ax])</code>	Scaled size whose relative part corresponds to the data height of the <i>axes</i> multiplied by the <i>aspect</i> .
<code>Fixed(fixed_size)</code>	Simple fixed size with absolute part = <i>fixed_size</i> and relative part = 0
<code>Fraction(fraction, ref_size)</code>	An instance whose size is a <i>fraction</i> of the <i>ref_size</i> .
<code>GetExtentHelper(ax, direction)</code>	
<code>MaxExtent(artist_list, w_or_h)</code>	Size whose absolute part is the largest width (or height) of the given <i>artist list</i> .
<code>MaxHeight(artist_list)</code>	Size whose absolute part is the largest height of the given <i>artist list</i> .
<code>MaxWidth(artist_list)</code>	Size whose absolute part is the largest width of the given <i>artist list</i> .
<code>Padded(size, pad)</code>	Return a instance where the absolute part of <i>size</i> is increase by the amount of <i>pad</i> .
<code>Scalable</code>	alias of <code>mpl_toolkits.axes_grid1.axes_size.Scaled</code>
<code>Scaled(scalable_size)</code>	Simple scaled(?) size with absolute part = 0 and relative part = <i>scalable_size</i>
<code>SizeFromFunc(func)</code>	

`mpl_toolkits.axes_grid1.axes_size.Add`

```
class mpl_toolkits.axes_grid1.axes_size.Add(a, b)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    get_size(renderer)
```

**mpl\_toolkits.axes\_grid1.axes\_size.AddList**

```
class mpl_toolkits.axes_grid1.axes_size.AddList(add_list)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    get_size(renderer)
```

**mpl\_toolkits.axes\_grid1.axes\_size.AxesX**

```
class mpl_toolkits.axes_grid1.axes_size.AxesX(axes, aspect=1.0, ref_ax=None)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Scaled size whose relative part corresponds to the data width of the axes multiplied by
    the aspect.
    get_size(renderer)
```

**Examples using `mpl_toolkits.axes_grid1.axes_size.AxesX`**

- sphx\_glr\_gallery\_axes\_grid1\_demo\_axes\_hbox\_divider.py
- sphx\_glr\_gallery\_axes\_grid1\_simple\_axes\_divider3.py

**mpl\_toolkits.axes\_grid1.axes\_size.AxesY**

```
class mpl_toolkits.axes_grid1.axes_size.AxesY(axes, aspect=1.0, ref_ax=None)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Scaled size whose relative part corresponds to the data height of the axes multiplied by
    the aspect.
    get_size(renderer)
```

**Examples using `mpl_toolkits.axes_grid1.axes_size.AxesY`**

- sphx\_glr\_gallery\_axes\_grid1\_demo\_axes\_hbox\_divider.py
- sphx\_glr\_gallery\_axes\_grid1\_simple\_axes\_divider3.py

**mpl\_toolkits.axes\_grid1.axes\_size.Fixed**

```
class mpl_toolkits.axes_grid1.axes_size.Fixed(fixed_size)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Simple fixed size with absolute part = fixed_size and relative part = 0
    get_size(renderer)
```

**Examples using `mpl_toolkits.axes_grid1.axes_size.Fixed`**

- `sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py`
- `sphx_glr_gallery_axes_grid1_simple_axes_divider2.py`
- `sphx_glr_gallery_axes_grid1_simple_axes_divider3.py`

**`mpl_toolkits.axes_grid1.axes_size.Fraction`**

```
class mpl_toolkits.axes_grid1.axes_size.Fraction(fraction, ref_size)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
```

An instance whose size is a *fraction* of the *ref\_size*.

```
>>> s = Fraction(0.3, AxesX(ax))
```

```
    get_size(renderer)
```

**`mpl_toolkits.axes_grid1.axes_size.GetExtentHelper`**

```
class mpl_toolkits.axes_grid1.axes_size.GetExtentHelper(ax, direction)
    Bases: object
```

**`mpl_toolkits.axes_grid1.axes_size.MaxExtent`**

```
class mpl_toolkits.axes_grid1.axes_size.MaxExtent(artist_list, w_or_h)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
```

Size whose absolute part is the largest width (or height) of the given *artist\_list*.

```
    add_artist(a)
```

```
    get_size(renderer)
```

**`mpl_toolkits.axes_grid1.axes_size.MaxHeight`**

```
class mpl_toolkits.axes_grid1.axes_size.MaxHeight(artist_list)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
```

Size whose absolute part is the largest height of the given *artist\_list*.

```
    add_artist(a)
```

```
    get_size(renderer)
```

**`mpl_toolkits.axes_grid1.axes_size.MaxWidth`**

```
class mpl_toolkits.axes_grid1.axes_size.MaxWidth(artist_list)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
```

Size whose absolute part is the largest width of the given *artist\_list*.

```
add_artist(a)
get_size(renderer)
```

#### `mpl_toolkits.axes_grid1.axes_size.Padded`

```
class mpl_toolkits.axes_grid1.axes_size.Padded(size, pad)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Return a instance where the absolute part of size is increase by the amount of pad.
    get_size(renderer)
```

#### `mpl_toolkits.axes_grid1.axes_size.Scalable`

```
mpl_toolkits.axes_grid1.axes_size.Scalable
    alias of mpl_toolkits.axes_grid1.axes_size.Scaled
```

#### `mpl_toolkits.axes_grid1.axes_size.Scaled`

```
class mpl_toolkits.axes_grid1.axes_size.Scaled(scalable_size)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Simple scaled(?) size with absolute part = 0 and relative part = scalable_size
    get_size(renderer)
```

#### Examples using `mpl_toolkits.axes_grid1.axes_size.Scaled`

- `sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py`
- `sphx_glr_gallery_axes_grid1_simple_axes_divider2.py`

#### `mpl_toolkits.axes_grid1.axes_size.SizeFromFunc`

```
class mpl_toolkits.axes_grid1.axes_size.SizeFromFunc(func)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    get_size(renderer)
```

#### Functions

---

<code>from_any(size[, fraction_ref])</code>	Creates Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %.
---	---

---

**mpl\_toolkits.axes\_grid1.axes\_size.from\_any**

```
mpl_toolkits.axes_grid1.axes_size.from_any(size, fraction_ref=None)
```

Creates Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %. The second argument is only meaningful when Fraction unit is created.:

```
>>> a = Size.from_any(1.2) # => Size.Fixed(1.2)
>>> Size.from_any("50%", a) # => Size.Fraction(0.5, a)
```

**mpl\_toolkits.axes\_grid1.colorbar**

Colorbar toolkit with two classes and a function:

*ColorbarBase* the base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

*Colorbar* the derived class for use with images or contour plots.

*make\_axes()* a function for resizing an axes and adding a second axes suitable for a colorbar

The *colorbar()* method uses *make\_axes()* and *Colorbar*; the *colorbar()* function is a thin wrapper over *colorbar()*.

```
class mpl_toolkits.axes_grid1.colorbar.CbarAxesLocator(locator=None,          ex-
                                                         tend='neither',      orienta-
                                                         tion='vertical')
```

CbarAxesLocator is a axes\_locator for colorbar axes. It adjust the position of the axes to make a room for extended ends, i.e., the extended ends are located outside the axes area.

**locator** [the bbox returned from the locator is used as a] initial axes location. If None, axes.bbox is used.

*extend* : same as in ColorbarBase *orientation* : same as in ColorbarBase

*get\_end\_vertices()*

return a tuple of two vertices for the colorbar extended ends. The first vertices is for the minimum end, and the second is for the maximum end.

*get\_original\_position(axes, renderer)*

get the original position of the axes.

*get\_path\_ends()*

get the paths for extended ends

*get\_path\_patch()*

get the path for axes patch

```
class mpl_toolkits.axes_grid1.colorbar.Colorbar(ax, mappable, **kw)
```

*add\_lines(CS)*

Add the lines from a non-filled *ContourSet* to the colorbar.

*update\_bruteforce(mappable)*

Update the colorbar artists to reflect the change of the associated mappable.

```
class mpl_toolkits.axes_grid1.colorbar.ColorbarBase(ax, cmap=None, norm=None,
                                                    alpha=1.0, values=None,
                                                    boundaries=None, orienta-
                                                    tion='vertical', extend='neither',
                                                    spacing='uniform', ticks=None,
                                                    format=None, drawedges=False,
                                                    filled=True)
```

Draw a colorbar in an existing axes.

This is a base class for the `Colorbar` class, which is the basis for the `colorbar()` method and `pyplot` function.

It is also useful by itself for showing a colormap. If the `cmap` kwarg is given but `boundaries` and `values` are left as `None`, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the `norm` as:

```
colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```
norm=colors.NoNorm.
```

Useful attributes:

- `ax` the Axes instance in which the colorbar is drawn
- `lines` a LineCollection if lines were drawn, otherwise `None`
- `dividers` a LineCollection if `drawedges` is `True`, otherwise `None`

Useful public methods are `set_label()` and `add_lines()`.

`add_lines(levels, colors, linewidths)`

Draw lines on the colorbar. It deletes preexisting lines.

`set_alpha(alpha)`

set alpha value.

`set_label_text(label, **kw)`

Label the long axis of the colorbar

`update_artists()`

Update the colorbar associated artists, `filled` and `ends`. Note that `lines` are not updated. This needs to be called whenever `clim` of associated image changes.

```
mpl_toolkits.axes_grid1.colorbar.colorbar(mappable, cax=None, ax=None, **kw)
```

Create a colorbar for a `ScalarMappable` instance.

Documentation for the `pyplot` thin wrapper:

Add a colorbar to a plot.

Function signatures for the `pyplot` interface; all but the first are also method signatures for the `colorbar()` method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

arguments:

**mappable** the Image, *ContourSet*, etc. to which the colorbar applies; this argument is mandatory for the *colorbar()* method but optional for the *colorbar()* function, which sets the default to the current image.

keyword arguments:

**ax** None | axes object into which the colorbar will be drawn

**ax** None | parent axes object from which space for a new colorbar axes will be stolen

Additional keyword arguments are of two kinds:

axes properties:

Property	Description
<i>orientation</i>	vertical or horizontal
<i>fraction</i>	0.15; fraction of original axes to use for colorbar
<i>pad</i>	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
<i>shrink</i>	1.0; fraction by which to shrink the colorbar
<i>aspect</i>	20; ratio of long to short dimensions

colorbar properties:

Property	Description
<i>extend</i>	[ 'neither'   'both'   'min'   'max' ] If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap <i>set_under</i> and <i>set_over</i> methods.
<i>spacing</i>	[ 'uniform'   'proportional' ] Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<i>ticks</i>	[ None   list of ticks   Locator object ] If None, ticks are determined automatically from the input.
<i>format</i>	[ None   format string   Formatter object ] If None, the <i>ScalarFormatter</i> is used. If a format string is given, e.g., '%.3f', that is used. An alternative <i>Formatter</i> object may be given instead.
<i>drawedges</i>	Whether to draw lines at color boundaries.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has *norm=NoNorm()*), or other unusual circumstances.

Property	Description
<i>boundaries</i>	None or a sequence
<i>values</i>	None or a sequence which must be of length 1 less than the sequence of <i>boundaries</i> . For each region delimited by adjacent entries in <i>boundaries</i> , the color mapped to the corresponding value in <i>values</i> will be used.

If *mappable* is a *ContourSet*, its *extend* kwarg is included automatically.

Note that the *shrink* kwarg provides a simple way to keep a vertical colorbar, for example, from being taller than the axes of the mappable to which the colorbar is attached; but it is a manual method requiring some trial and error. If the colorbar is too tall (or a horizontal colorbar is too wide) use a smaller value of *shrink*.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewer (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers not matplotlib. As a workaround the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances. Particularly with semi transparent images ( $\alpha < 1$ ) and colorbar extensions and is not enabled by default see (issue #1188).

**returns:** *Colorbar* instance; see also its base class, *ColorbarBase*. Call the *set\_label()* method to label the colorbar.

The *transData* of the *cax* is adjusted so that the limits in the longest axis actually corresponds to the limits in colorbar range. On the other hand, the shortest axis has a data limits of [1,2], whose unconventional value is to prevent underflow when log scale is used.

```
mpl_toolkits.axes_grid1.colorbar.make_axes(parent, *, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Resize and reposition a parent axes, and return a child axes suitable for a colorbar

```
cax, kw = make_axes(parent, **kw)
```

Keyword arguments may include the following (with defaults):

***orientation*** 'vertical' or 'horizontal'

Property	Description
<i>orientation</i>	vertical or horizontal
<i>fraction</i>	0.15; fraction of original axes to use for colorbar
<i>pad</i>	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
<i>shrink</i>	1.0; fraction by which to shrink the colorbar
<i>aspect</i>	20; ratio of long to short dimensions

All but the first of these are stripped from the input kw set.

Returns (cax, kw), the child axes and the reduced kw dictionary.

### `mpl_toolkits.axes_grid1.inset_locator`

A collection of functions and objects for creating or placing inset axes.

#### Classes

<code>AnchoredLocatorBase(bbox_to_anchor, ...[, ...])</code>	
<code>AnchoredSizeLocator(bbox_to_anchor, x_size, ...)</code>	
<code>AnchoredZoomLocator(parent_axes, zoom, loc)</code>	
<code>BboxConnector(bbox1, bbox2, loc1[, loc2])</code>	Connect two bboxes with a straight line.
<code>BboxConnectorPatch(bbox1, bbox2, loc1a, ...)</code>	Connect two bboxes with a quadrilateral.
<code>BboxPatch(bbox, **kwargs)</code>	Patch showing the shape bounded by a Bbox.
<code>InsetPosition(parent, lbwh)</code>	An object for positioning an inset axes.

#### `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`

```
class mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase(bbox_to_anchor,
                                                                offsetbox, loc,
                                                                borderpad=0.5,
                                                                bbox_transform=None)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

```
draw(renderer)
    draw the artist
```

#### `mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator`

```
class mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator(bbox_to_anchor,
                                                                x_size, y_size, loc,
                                                                borderpad=0.5,
                                                                bbox_transform=None)
```

Bases: `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`

`get_extent(renderer)`  
 return the extent of the artist. The extent of the child added with the pad is returned

**`mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator`**

```
class mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator(parent_axes, zoom,
                                                                loc, borderpad=0.5,
                                                                bbox_to_anchor=None,
                                                                bbox_transform=None)
```

Bases: `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`

`get_extent(renderer)`  
 return the extent of the artist. The extent of the child added with the pad is returned

**`mpl_toolkits.axes_grid1.inset_locator.BboxConnector`**

```
class mpl_toolkits.axes_grid1.inset_locator.BboxConnector(bbox1, bbox2, loc1,
                                                         loc2=None, **kwargs)
```

Bases: `matplotlib.patches.Patch`

Connect two bboxes with a straight line.

**Parameters**

**`bbox1, bbox2`** [`matplotlib.transforms.Bbox`] Bounding boxes to connect.

**`loc1`** [{1, 2, 3, 4}] Corner of `bbox1` to draw the line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**`loc2`** [{1, 2, 3, 4}, optional] Corner of `bbox2` to draw the line. If None, defaults to `loc1`. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**\*\*kwargs** Patch properties for the line drawn. Valid arguments include:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>antialiased</code>	unknown
<code>capstyle</code>	{'butt', 'round', 'projecting'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	[( <code>Path</code> , <code>Transform</code> )   <code>Patch</code>   None]
<code>color</code>	color
<code>contains</code>	callable

Continued on next page

Table 11 – continued from previous page

Property	Description
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '-', '-.', ':', "", (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
static connect_bbox(bbox1, bbox2, loc1, loc2=None)
```

Helper function to obtain a Path from one bbox to another.

### Parameters

**bbox1, bbox2** [*matplotlib.transforms.Bbox*] Bounding boxes to connect.

**loc1** [{1, 2, 3, 4}] Corner of *bbox1* to use. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**loc2** [{1, 2, 3, 4}, optional] Corner of *bbox2* to use. If None, defaults to *loc1*. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

### Returns

**path** [*matplotlib.path.Path*] A line segment from the *loc1* corner of *bbox1* to the *loc2* corner of *bbox2*.

```
static get_bbox_edge_pos(bbox, loc)
```

Helper function to obtain the location of a corner of a bbox

### Parameters

**bbox** [*matplotlib.transforms.Bbox*]

**loc** [{1, 2, 3, 4}] Corner of *bbox*. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

### Returns

**x, y** [float] Coordinates of the corner specified by *loc*.

`get_path()`

Return the path of this patch

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

- `sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py`

`mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch`

```
class mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch(bbox1, bbox2, loc1a,
                                                                loc2a, loc1b, loc2b,
                                                                **kwargs)
```

Bases: `mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in *bbox1* and the line between the two corners specified in *bbox2*.

### Parameters

**bbox1, bbox2** [`matplotlib.transforms.Bbox`] Bounding boxes to connect.

**loc1a, loc2a** [{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the first line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**loc1b, loc2b** [{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the second line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**\*\*kwargs** Patch properties for the line drawn:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'
<i>facecolor</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i>	float or None for default
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`get_path()`  
Return the path of this patch

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch`

- `sphinx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py`

`mpl_toolkits.axes_grid1.inset_locator.BboxPatch`

```
class mpl_toolkits.axes_grid1.inset_locator.BboxPatch(bbox, **kwargs)
    Bases: matplotlib.patches.Patch
```

Patch showing the shape bounded by a Bbox.

### Parameters

**bbox** [`matplotlib.transforms.Bbox`] Bbox to use for the extents of this patch.

**\*\*kwargs** Patch properties. Valid arguments include:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>color</i>	color
<i>contains</i>	callable
<i>edgecolor</i>	color or None or 'auto'

```
get_path()
    Return the path of this patch
```

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxPatch`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_zoom\_effect.py

`mpl_toolkits.axes_grid1.inset_locator.InsetPosition`

```
class mpl_toolkits.axes_grid1.inset_locator.InsetPosition(parent, lbwh)
    Bases: object
```

An object for positioning an inset axes.

This is created by specifying the normalized coordinates in the axes, instead of the figure.

#### Parameters

**parent** [`matplotlib.axes.Axes`] Axes to use for normalizing coordinates.

**lbwh** [iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the *parent* axes.

**See also:**

`matplotlib.axes.Axes.set_axes_locator()`

**Examples**

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ([0, 0, 1, 1]) ensures that the axes completely fills the bounding box:

```
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

**Functions**

<code>inset_axes(parent_axes, width, height[, ...])</code>	Create an inset axes with a given width and height.
<code>mark_inset(parent_axes, inset_axes, loc1, ...)</code>	Draw a box to mark the location of an area represented by an inset axes.
<code>zoomed_inset_axes(parent_axes, zoom[, loc, ...])</code>	Create an anchored inset axes by scaling a parent axes.

**mpl\_toolkits.axes\_grid1.inset\_locator.inset\_axes**

```
mpl_toolkits.axes_grid1.inset_locator.inset_axes(parent_axes, width, height, loc='upper right',
bbox_to_anchor=None,
bbox_transform=None,
axes_class=None,
axes_kwargs=None, borderpad=0.5)
```

Create an inset axes with a given width and height.

Both sizes used can be specified either in inches or percentage. For example,:

```
inset_axes(parent_axes, width='40%', height='30%', loc=3)
```

creates an inset axes in the lower left corner of *parent\_axes* which spans over 30% in height and 40% in width of the *parent\_axes*. Since the usage of *inset\_axes* may become slightly tricky when exceeding such standard cases, it is recommended to read the examples.

**Parameters**

**parent\_axes** [`matplotlib.axes.Axes`] Axes to place the inset axes.

**width, height** [float or str] Size of the inset axes to create. If a float is

provided, it is the size in inches, e.g. `width=1.3`. If a string is provided, it is the size in relative units, e.g. `width='40%`. By default, i.e. if neither `bbox_to_anchor` nor `bbox_transform` are specified, those are relative to the parent axes. Otherwise they are to be understood relative to the bounding box provided via `bbox_to_anchor`.

**loc** [int or string, optional, default to 1] Location to place the inset axes. The valid locations are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**bbox\_to\_anchor** [tuple or `matplotlib.transforms.BboxBase`, optional] Bbox that the inset axes will be anchored to. If None, a tuple of (0, 0, 1, 1) is used if `bbox_transform` is set to `parent_axes.transAxes` or `parent_axes.figure.transFigure`. Otherwise, `parent_axes.bbox` is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs `width` and/or `height` are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that, unless `bbox_transform` is set, the units of the bounding box are interpreted in the pixel coordinate. When using `bbox_to_anchor` with tuple, it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`.

**bbox\_transform** [`matplotlib.transforms.Transform`, optional] Transformation for the bbox that contains the inset axes. If None, a `transforms.IdentityTransform` is used. The value of `bbox_to_anchor` (or the return value of its `get_points` method) is transformed by the `bbox_transform` and then interpreted as points in the pixel coordinate (which is dpi dependent). You may provide `bbox_to_anchor` in some normalized coordinate, and give an appropriate transform (e.g., `parent_axes.transAxes`).

**axes\_class** [`matplotlib.axes.Axes` type, optional] If specified, the inset axes created will be created with this class's constructor.

**axes\_kwargs** [dict, optional] Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (
<code>alpha</code>	float
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or num
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool

Property	Description
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[Axes, Renderer], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	[( <i>Path</i> , <i>Transform</i> )   <i>Patch</i>   None]
<i>contains</i>	callable
<i>facecolor</i>	color
<i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or float or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xbound</i>	(lower: float, upper: float)
<i>xlabel</i>	str
<i>xlim</i>	(left: float, right: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>xticklabels</i>	List[str]
<i>xticks</i>	list
<i>ybound</i>	(lower: float, upper: float)
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	List[str]
<i>yticks</i>	list
<i>zorder</i>	float

**borderpad** [float, optional] Padding between inset axes and the `bbox_to_anchor`. Defaults to 0.5. The units are axes font size, i.e. for a default font size of 10 points `borderpad = 0.5` is equivalent to a padding of 5 points.

#### Returns

**inset\_axes** [*axes\_class*] Inset axes object created.

## Notes

The meaning of *bbox\_to\_anchor* and *bbox\_to\_transform* is interpreted differently from that of *legend*. The value of *bbox\_to\_anchor* (or the return value of its *get\_points* method; the default is *parent\_axes.bbox*) is transformed by the *bbox\_transform* (the default is Identity transform) and then interpreted as points in the pixel coordinate (which is dpi dependent).

Thus, following three calls are identical and creates an inset axes with respect to the *parent\_axes*:

```
axins = inset_axes(parent_axes, "30%", "40%")
axins = inset_axes(parent_axes, "30%", "40%",
                   bbox_to_anchor=parent_axes.bbox)
axins = inset_axes(parent_axes, "30%", "40%",
                   bbox_to_anchor=(0, 0, 1, 1),
                   bbox_transform=parent_axes.transAxes)
```

Examples using `mpl_toolkits.axes_grid1.inset_locator.inset_axes`

- sphx\_glr\_gallery\_axes\_grid1\_demo\_colorbar\_of\_inset\_axes.py
- sphx\_glr\_gallery\_axes\_grid1\_demo\_colorbar\_with\_inset\_locator.py
- sphx\_glr\_gallery\_axes\_grid1\_inset\_locator\_demo.py

`mpl_toolkits.axes_grid1.inset_locator.mark_inset`

```
mpl_toolkits.axes_grid1.inset_locator.mark_inset(parent_axes, inset_axes, loc1, loc2,
                                                **kwargs)
```

Draw a box to mark the location of an area represented by an inset axes.

This function draws a box in *parent\_axes* at the bounding box of *inset\_axes*, and shows a connection with the inset axes by drawing lines at the corners, giving a "zoomed in" effect.

## Parameters

**parent\_axes** [*matplotlib.axes.Axes*] Axes which contains the area of the inset axes.

**inset\_axes** [*matplotlib.axes.Axes*] The inset axes.

**loc1, loc2** [{1, 2, 3, 4}] Corners to use for connecting the inset axes and the area in the parent axes.

**\*\*kwargs** Patch properties for the lines and box drawn:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3)
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}

<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

### Returns

**pp** [*matplotlib.patches.Patch*] The patch drawn to represent the area of the inset axes.

**p1, p2** [*matplotlib.patches.Patch*] The patches connecting two corners of the inset axes and its area.

Examples using `mpl_toolkits.axes_grid1.inset_locator.mark_inset`

- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`

`mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

```
mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes(parent_axes,          zoom,
                                                         loc='upper',          right',
                                                         bbox_to_anchor=None,
                                                         bbox_transform=None,
                                                         axes_class=None,
                                                         axes_kwargs=None,    borderpad=0.5)
```

Create an anchored inset axes by scaling a parent axes. For usage, also see the examples.

### Parameters

**parent\_axes** [*matplotlib.axes.Axes*] Axes to place the inset axes.

**zoom** [float] Scaling factor of the data axes. *zoom* > 1 will enlarge the coordinates (i.e., "zoomed in"), while *zoom* < 1 will shrink the coordinates (i.e., "zoomed out").

**loc** [int or string, optional, default to 1] Location to place the inset axes. The valid locations are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**bbox\_to\_anchor** [tuple or *matplotlib.transforms.BboxBase*, optional] Bbox that the inset axes will be anchored to. If None, *parent\_axes.bbox* is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs *width* and/or *height* are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that the units of the bounding box are determined through the transform in use. When using *bbox\_to\_anchor* it almost always makes sense to also specify a *bbox\_transform*. This might often be the axes transform *parent\_axes.transAxes*.

**bbox\_transform** [*matplotlib.transforms.Transform*, optional] Transformation for the bbox that contains the inset axes. If None, a *transforms.IdentityTransform* is used (i.e. pixel coordinates). This is useful when not providing any argument to *bbox\_to\_anchor*. When using *bbox\_to\_anchor* it almost always makes sense to also specify a *bbox\_transform*. This might often be the axes transform *parent\_axes.transAxes*. Inversely, when specifying the axes- or figure-transform here, be aware that not specifying *bbox\_to\_anchor* will use *parent\_axes.bbox*, the units of which are in display (pixel) coordinates.

**axes\_class** [*matplotlib.axes.Axes* type, optional] If specified, the inset axes created will be created with this class's constructor.

**axes\_kwargs** [dict, optional] Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (
<i>alpha</i>	float
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto', 'equal'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool

<code>yticks</code>	list
<code>zorder</code>	float

**borderpad** [float, optional] Padding between inset axes and the `bbox_to_anchor`. Defaults to 0.5. The units are axes font size, i.e. for a default font size of 10 points `borderpad = 0.5` is equivalent to a padding of 5 points.

#### Returns

**inset\_axes** [`axes_class`] Inset axes object created.

Examples using `mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

- `sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py`
- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`

`mpl_toolkits.axes_grid1.mpl_axes`

Classes

<code>Axes(fig, rect[, facecolor, frameon, ...])</code>	Build an axes in a figure.
<code>SimpleAxisArtist(axis, axisnum, spine)</code>	
<code>SimpleChainedObjects(objects)</code>	

`mpl_toolkits.axes_grid1.mpl_axes.Axes`

```
class mpl_toolkits.axes_grid1.mpl_axes.Axes(fig, rect, facecolor=None, frameon=True,
sharex=None, sharey=None, label="", xscale=None, yscale=None, **kwargs)
```

Bases: `matplotlib.axes._axes.Axes`

Build an axes in a figure.

**Parameters**

- fig** [*Figure*] The axes is build in the *Figure fig*.
- rect** [[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.
- sharex, sharey** [*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.
- frameon** [bool, optional] True means that the axes frame is visible.
- \*\*kwargs** Other optional keyword arguments:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (
<code>alpha</code>	float
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto', 'equal'} or num

## Returns

**axes** [*Axes*] The new *Axes* object.

```
class AxisDict() -> new empty dictionary
dict(mapping) -> new dictionary initialized from a mapping object's (key, value) pairs
dict(iterable) -> new dictionary initialized as if via: d = {} for k, v in iterable: d[k] = v
dict(**kwargs) -> new dictionary initialized with the name=value pairs in the keyword argument list. For example: dict(one=1, two=2)
```

Bases: dict

**axis**

**cla()**

Clear the current axes.

Examples using `mpl_toolkits.axes_grid1.mpl_axes.Axes`

- `sphx_glr_gallery_axes_grid1_demo_axes_divider.py`
- `sphx_glr_gallery_axes_grid1_demo_fixed_size_axes.py`

`mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist`

```
class mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist(axis, axisnum, spine)
```

Bases: `matplotlib.artist.Artist`

`label`

`major_ticklabels`

`major_ticks`

`set_label(txt)`

Set the label to *s* for auto legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling `str`.

`set_visible(b)`

Set the artist's visibility.

**Parameters**

**b** [bool]

`toggle(all=None, ticks=None, ticklabels=None, label=None)`

`mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects`

```
class mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects(objects)
```

Bases: `object`

```
contour(*XYCL, **kwargs)
contourf(*XYCL, **kwargs)
get_viewlim_mode()
pcolor(*XYC, **kwargs)
pcolormesh(*XYC, **kwargs)
set_viewlim_mode(mode)
update_viewlim()
```

### `mpl_toolkits.axes_grid1.parasite_axes.ParasiteAxesBase`

```
class mpl_toolkits.axes_grid1.parasite_axes.ParasiteAxesBase(parent_axes, **kwargs)
    Bases: object
    cla()
    get_images_artists()
```

### Functions

---

<code>host_axes(*args[, axes_class, figure])</code>	Create axes that can act as a hosts to parasitic axes.
<code>host_subplot(*args[, axes_class, figure])</code>	Create a subplot that can act as a host to parasitic axes.
<code>host_subplot_class_factory(axes_class)</code>	

---

### `mpl_toolkits.axes_grid1.parasite_axes.host_axes`

```
mpl_toolkits.axes_grid1.parasite_axes.host_axes(*args, axes_class=None, figure=None, **kwargs)
    Create axes that can act as a hosts to parasitic axes.
```

#### Parameters

**figure** [*matplotlib.figure.Figure*] Figure to which the axes will be added. Defaults to the current figure `pyplot.gcf()`.

**\*args, \*\*kwargs** : Will be passed on to the underlying Axes object creation.

### `mpl_toolkits.axes_grid1.parasite_axes.host_subplot`

```
mpl_toolkits.axes_grid1.parasite_axes.host_subplot(*args, axes_class=None, figure=None, **kwargs)
    Create a subplot that can act as a host to parasitic axes.
```

#### Parameters

**figure** [*matplotlib.figure.Figure*] Figure to which the subplot will be added. Defaults to the current figure `pyplot.gcf()`.

**\*args, \*\*kwargs** : Will be passed on to the underlying Axes object creation.

`mpl_toolkits.axes_grid1.parasite_axes.host_subplot_class_factory`

`mpl_toolkits.axes_grid1.parasite_axes.host_subplot_class_factory(axes_class)`

### 19.1.3 Matplotlib axisartist Toolkit

The *axisartist* namespace includes a derived Axes implementation (`mpl_toolkits.axisartist.Axes`). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the [axisartist](#) user guide.

#### The submodules of the axisartist API are:

<code>axisartist.angle_helper</code>	
<code>axisartist.axes_divider</code>	
<code>axisartist.axes_grid</code>	
<code>axisartist.axes_rgb</code>	
<code>axisartist.axis_artist</code>	axis_artist.py module provides axis-related artists.
<code>axisartist.axisline_style</code>	
<code>axisartist.axislines</code>	Axislines includes modified implementation of the Axes class.
<code>axisartist.clip_path</code>	
<code>axisartist.floating_axes</code>	An experimental support for curvilinear grid.
<code>axisartist.grid_finder</code>	
<code>axisartist.grid_helper_curvilinear</code>	An experimental support for curvilinear grid.
<code>axisartist.parasite_axes</code>	

`mpl_toolkits.axisartist.angle_helper`

## Classes

<i>ExtremeFinderCycle</i> (nx, ny[, lon_cycle, ...])	When there is a cycle, e.g., longitude goes from 0-360.
<i>FormatterDMS</i>	
<i>FormatterHMS</i>	
<i>LocatorBase</i> (den[, include_last])	
<i>LocatorD</i> (den[, include_last])	
<i>LocatorDM</i> (den[, include_last])	
<i>LocatorDMS</i> (den[, include_last])	
<i>LocatorH</i> (den[, include_last])	
<i>LocatorHM</i> (den[, include_last])	
<i>LocatorHMS</i> (den[, include_last])	

### `mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle`

```
class mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle(nx, ny,
                                                             lon_cycle=360.0,
                                                             lat_cycle=None,
                                                             lon_minmax=None,
                                                             lat_minmax=(-90, 90))
```

Bases: `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

When there is a cycle, e.g., longitude goes from 0-360.

```

### `mpl_toolkits.axisartist.angle_helper.select_step_sub`

```
mpl_toolkits.axisartist.angle_helper.select_step_sub(dv)
```

### `mpl_toolkits.axisartist.axes_divider`

## Classes

<code>Axes(**kwargs)</code>	Deprecated since version 3.0.
-----------------------------	-------------------------------

<code>LocatableAxes(**kwargs)</code>	Deprecated since version 3.0.
--------------------------------------	-------------------------------

---

### `mpl_toolkits.axisartist.axes_divider.Axes`

```
class mpl_toolkits.axisartist.axes_divider.Axes(**kwargs)
```

Bases: `mpl_toolkits.axisartist.axislines.Axes`

Deprecated since version 3.0: The `Axes` class was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use `mpl_toolkits.axisartist.axislines.Axes` instead.

### `mpl_toolkits.axisartist.axes_divider.LocatableAxes`

```
class mpl_toolkits.axisartist.axes_divider.LocatableAxes(**kwargs)
```

Bases: `mpl_toolkits.axisartist.axislines.Axes`

Deprecated since version 3.0: The `LocatableAxes` class was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use `mpl_toolkits.axisartist.axislines.Axes` instead.

### `mpl_toolkits.axisartist.axes_grid`

#### Classes

<code>AxesGrid</code>	alias of <code>mpl_toolkits.axisartist.axes_grid.ImageGrid</code>
-----------------------	---

<code>CbarAxes(*args, orientation, **kwargs)</code>	
<code>Grid(fig, rect, nrows_ncols[, ngrids, ...])</code>	Build an <code>Grid</code> instance with a grid <code>nrows*ncols</code> <code>Axes</code> in <code>Figure fig</code> with <code>rect=[left, bottom, width, height]</code> (in <code>Figure</code> coordinates) or the subplot position code (e.g., "121").

<code>ImageGrid(fig, rect, nrows_ncols[, ngrids, ...])</code>	Build an <code>ImageGrid</code> instance with a grid <code>nrows*ncols</code> <code>Axes</code> in <code>Figure fig</code> with <code>rect=[left, bottom, width, height]</code> (in <code>Figure</code> coordinates) or the subplot position code (e.g., "121").
---	--

---

### `mpl_toolkits.axisartist.axes_grid.AxesGrid`

```
mpl_toolkits.axisartist.axes_grid.AxesGrid
    alias of mpl_toolkits.axisartist.axes_grid.ImageGrid
```

### `mpl_toolkits.axisartist.axes_grid.CbarAxes`

```
class mpl_toolkits.axisartist.axes_grid.CbarAxes(*args, orientation, **kwargs)
```

Bases: `mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase`, `mpl_toolkits.axisartist.`

*axislines.Axes*

`cla()`  
Clear the current axes.

### `mpl_toolkits.axisartist.axes_grid.Grid`

```
class mpl_toolkits.axisartist.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None,
                                             direction='row', axes_pad=0.02,
                                             add_all=True, share_all=False,
                                             share_x=True, share_y=True, la-
                                             bel_mode='L', axes_class=None)
```

Bases: `mpl_toolkits.axes_grid1.axes_grid.Grid`

Build an `Grid` instance with a grid `nrows*ncols` *Axes* in *Figure fig* with `rect=[left, bottom, width, height]` (in *Figure* coordinates) or the subplot position code (e.g., "121").

Optional keyword arguments:

Key-word	De-fault	Description
<code>direction</code>	"row"	[ "row"   "column" ]
<code>axes_pad</code>	0.02	float  pad between axes given in inches or tuple-like of floats, (horizontal padding, vertical padding)
<code>add_all</code>	True	bool
<code>share_all</code>	False	bool
<code>share_x</code>	True	bool
<code>share_y</code>	True	bool
<code>label_mode</code>	"L"	[ "L"   "1"   "all" ]
<code>axes_class</code>	None	a type object which must be a subclass of <i>Axes</i>

### `mpl_toolkits.axisartist.axes_grid.ImageGrid`

```
class mpl_toolkits.axisartist.axes_grid.ImageGrid(fig, rect, nrows_ncols,
                                                  ngrids=None, direction='row',
                                                  axes_pad=0.02, add_all=True,
                                                  share_all=False, aspect=True, la-
                                                  bel_mode='L', cbar_mode=None,
                                                  cbar_location='right',
                                                  cbar_pad=None, cbar_size='5%',
                                                  cbar_set_cax=True,
                                                  axes_class=None)
```

Bases: `mpl_toolkits.axes_grid1.axes_grid.ImageGrid`

Build an `ImageGrid` instance with a grid `nrows*ncols` *Axes* in *Figure fig* with `rect=[left, bottom, width, height]` (in *Figure* coordinates) or the subplot position code (e.g., "121").

Optional keyword arguments:

Keyword	Default	Description
direction	"row"	[ "row"   "column" ]
axes_pad	0.02	float  pad between axes given in inches or tuple-like of floats, (horizontal padding, vertical padding)
add_all	True	bool
share_all	False	bool
aspect	True	bool
label_mode	"L"	[ "L"   "1"   "all" ]
cbar_mode	None	[ "each"   "single"   "edge" ]
cbar_location	"right"	[ "left"   "right"   "bottom"   "top" ]
cbar_pad	None	
cbar_size	"5%"	
cbar_set_cax	True	bool
axes_class	None	a type object which must be a subclass of axes_grid's subclass of <i>Axes</i>

**cbar\_set\_cax** [if True, each axes in the grid has a cax] attribute that is bind to associated cbar\_axes.

`mpl_toolkits.axisartist.axes_rgb`

Classes

---

`RGBAxes(*args[, pad, add_all])`

**Parameters**

---

`mpl_toolkits.axisartist.axes_rgb.RGBAxes`

```
class mpl_toolkits.axisartist.axes_rgb.RGBAxes(*args, pad=0, add_all=True, **kwargs)
    Bases: mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase
```

**Parameters**

- pad** [float] fraction of the axes height to put as padding. defaults to 0.0
- add\_all** [bool] True: Add the {rgb, r, g, b} axes to the figure defaults to True.
- axes\_class** [matplotlib.axes.Axes]
- kl** : Unpacked into axes\_class() init for RGB
- kwargs** : Unpacked into axes\_class() init for RGB, R, G, B axes

`mpl_toolkits.axisartist.axis_artist`

axis\_artist.py module provides axis-related artists. They are

- axis line
- tick lines
- tick labels
- axis label
- grid lines

The main artist class is a `AxisArtist` and a `GridlinesCollection`. The `GridlinesCollection` is responsible for drawing grid lines and the `AxisArtist` is responsible for all other artists. The `AxisArtist` class has attributes that are associated with each type of artists.

- `line` : axis line
- `major_ticks` : major tick lines
- `major_ticklabels` : major tick labels
- `minor_ticks` : minor tick lines
- `minor_ticklabels` : minor tick labels
- `label` : axis label

Typically, the `AxisArtist` associated with a axes will be accessed with the `axis` dictionary of the axes, i.e., the `AxisArtist` for the bottom axis is

```
ax.axis["bottom"]
```

where `ax` is an instance of axes (`mpl_toolkits.axislines.Axes`). Thus, `ax.axis["bottom"].line` is an artist associated with the axis line, and `ax.axis["bottom"].major_ticks` is an artist associated with the major tick lines.

You can change the colors, fonts, line widths, etc. of these artists by calling suitable `set` method. For example, to change the color of the major ticks of the bottom axis to red,

```
ax.axis["bottom"].major_ticks.set_color("r")
```

However, things like the locations of ticks, and their ticklabels need to be changed from the side of the `grid_helper`.

### **axis\_direction**

`AxisArtist`, `AxisLabel`, `TickLabels` have `axis_direction` attribute, which adjusts the location, angle, etc.,. The `axis_direction` must be one of [`left`, `right`, `bottom`, `top`] and they follow the matplotlib convention for the rectangle axis.

For example, for the *bottom* axis (the left and right is relative to the direction of the increasing coordinate),

- ticklabels and axislabel are on the right
- ticklabels and axislabel have text angle of 0
- ticklabels are baseline, center-aligned
- axislabel is top, center-aligned

The text angles are actually relative to  $(90 + \text{angle of the direction to the ticklabel})$ , which gives 0 for bottom axis.

Parameter left bottom right top ticklabels location left right right left axislabel lo-  
 cation left right right left ticklabels angle 90 0 -90 180 axislabel angle 180 0 0 180  
 ticklabel va center baseline center baseline axislabel va center top center bottom  
 ticklabel ha right center right center axislabel ha right center right center

Ticks are by default direct opposite side of the ticklabels. To make ticks to the same side of the ticklabels,

```
ax.axis["bottom"].major_ticks.set_ticks_out(True)
```

Following attributes can be customized (use set\_xxx method)

- Ticks : ticksize, tick\_out
- TickLabels : pad
- AxisLabel : pad

### Classes

<i>AttributeCopier</i> (ref_artist[, klass])	
<i>AxisArtist</i> (axes, helper[, offset, ...])	An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.
<i>AxisLabel</i> (*args[, axis_direction, axis])	Axis Label.
<i>BezierPath</i> (path, *kl, **kw)	
<i>GridlinesCollection</i> (*args[, which, axis])	<i>which</i> : "major" or "minor" axis : "both", "x" or "y"
<i>LabelBase</i> (*kl, **kwargs)	A base class for AxisLabel and TickLabels.
<i>TickLabels</i> (*[, axis_direction])	Tick Labels.
<i>Ticks</i> (ticksize[, tick_out, axis])	Ticks are derived from Line2D, and note that ticks themselves are markers.

#### mpl\_toolkits.axisartist.axis\_artist.AttributeCopier

```
class mpl_toolkits.axisartist.axis_artist.AttributeCopier(ref_artist, klass=<class
    'matplotlib.artist.Artist'>)
    Bases: object
    get_attribute_from_ref_artist(attr_name, default_value)
    get_ref_artist()
    set_ref_artist(artist)
```

#### mpl\_toolkits.axisartist.axis\_artist.AxisArtist

```
class mpl_toolkits.axisartist.axis_artist.AxisArtist(axes, helper, offset=None,
    axis_direction='bottom', **kw)
    Bases: matplotlib.artist.Artist
    An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks,
    ticklabels, and axis label.
    axes : axes helper : an AxisArtistHelper instance.
```

LABELPAD

ZORDER = 2.5

`draw(renderer)`

Draw the axis lines, tick lines and labels

`get_axisline_style()`

return the current axisline style.

`get_helper()`

Return axis artist helper instance.

`get_tightbbox(renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

**bbox** [*BboxBase*] containing the bounding box (in figure pixel coordinates).

`get_transform()`

Return the *Transform* instance used by this artist.

`invert_ticklabel_direction()`

`set_axis_direction(axis_direction)`

Adjust the direction, text angle, text alignment of ticklabels, labels following the matplotlib convention for the rectangle axes.

The *axis\_direction* must be one of [left, right, bottom, top].

property	left	bottom	right	top
ticklabels location	"-"	"+"	"+"	"-"
axislabel location	"-"	"+"	"+"	"-"
ticklabels angle	90	0	-90	180
ticklabel va	center	baseline	center	baseline
ticklabel ha	right	center	right	center
axislabel angle	180	0	0	180
axislabel va	center	top	center	bottom
axislabel ha	right	center	right	center

Note that the direction "+" and "-" are relative to the direction of the increasing coordinate. Also, the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_axislabel_direction(label_direction)`

Adjust the direction of the axislabel.

Note that the *label\_directions* '+' and '-' are relative to the direction of the increasing coordinate.

### Parameters

**tick\_direction** [{"+", "-"}]

`set_axisline_style(axisline_style=None, **kw)`  
Set the axisline style.

***axisline\_style* can be a string with axisline style name with optional comma-separated attributes.** Alternatively, the attrs can be provided as keywords.

`set_arrowstyle("->,size=1.5")` `set_arrowstyle("->", size=1.5)`

Old attrs simply are forgotten.

Without argument (or with `arrowstyle=None`), return available styles as a list of strings.

`set_label(s)`  
Set the label to *s* for auto legend.

#### Parameters

*s* [object] *s* will be converted to a string by calling `str`.

`set_ticklabel_direction(tick_direction)`  
Adjust the direction of the ticklabel.

Note that the *label\_directions* '+' and '-' are relative to the direction of the increasing coordinate.

#### Parameters

***tick\_direction*** [{"+", "-"}]

`toggle(all=None, ticks=None, ticklabels=None, label=None)`  
Toggle visibility of ticks, ticklabels, and (axis) label. To turn all off,

```
axis.toggle(all=False)
```

To turn all off but ticks on

```
axis.toggle(all=False, ticks=True)
```

To turn all on but (axis) label off

```
axis.toggle(all=True, label=False)
```

### `mpl_toolkits.axisartist.axis_artist.AxisLabel`

```
class mpl_toolkits.axisartist.axis_artist.AxisLabel(*args, axis_direction='bottom',
                                                    axis=None, **kwargs)
```

Bases: `mpl_toolkits.axisartist.axis_artist.LabelBase`, `mpl_toolkits.axisartist.axis_artist.AttributeCopier`

Axis Label. Derived from `Text`. The position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal `Text`.

To change the pad between ticklabels and axis label, use `set_pad`.

`draw(renderer)`  
Draws the `Text` object to the given `renderer`.

`get_color()`  
Return the color of the text

`get_pad()`  
return pad in points. See `set_pad` for more details.

`get_ref_artist()`

`get_text()`  
Get the text as string

`get_window_extent(renderer)`  
Return a *Bbox* object bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

*renderer* defaults to the `_renderer` attribute of the text object. This is not assigned until the first execution of `draw()`, so you must use this kwarg if you want to call `get_window_extent` prior to the first `draw`. For getting web page regions, it is simpler to call the method after saving the figure.

*dpi* defaults to `self.figure.dpi`; the *renderer* dpi is irrelevant. For the web application, if `figure.dpi` is not the value used when saving the figure, then the value that was used must be specified as the *dpi* argument.

`set_axis_direction(d)`  
Adjust the text angle and text alignment of axis label according to the matplotlib convention.

property	left	bottom	right	top
axislabel angle	180	0	0	180
axislabel va	center	top	center	bottom
axislabel ha	right	center	right	center

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_default_alignment(d)`

`set_default_angle(d)`

`set_pad(pad)`  
Set the pad in points. Note that the actual pad will be the sum of the internal pad and the external pad (that are set automatically by the `AxisArtist`), and it only set the internal pad

### `mpl_toolkits.axisartist.axis_artist.BezierPath`

`class mpl_toolkits.axisartist.axis_artist.BezierPath(path, *kl, **kw)`

Bases: `matplotlib.lines.Line2D`

`draw(renderer)`  
draw the Line with *renderer* unless `visibility` is `False`

`recache()`

`set_path(path)`

**mpl\_toolkits.axisartist.axis\_artist.GridlinesCollection**

```
class mpl_toolkits.axisartist.axis_artist.GridlinesCollection(*args, which='major',
                                                            axis='both', **kwargs)
```

Bases: *matplotlib.collections.LineCollection*

*which* : "major" or "minor" *axis* : "both", "x" or "y"

*draw(renderer)*

Derived classes drawing method

*set\_axis(axis)*

*set\_grid\_helper(grid\_helper)*

*set\_which(which)*

**mpl\_toolkits.axisartist.axis\_artist.LabelBase**

```
class mpl_toolkits.axisartist.axis_artist.LabelBase(*kl, **kwargs)
```

Bases: *matplotlib.text.Text*

A base class for *AxisLabel* and *TickLabels*. The position and angle of the text are calculated by *offset\_ref\_angle*, *text\_ref\_angle*, and *offset\_radius* attributes.

*draw(renderer)*

Draws the *Text* object to the given *renderer*.

*get\_window\_extent(renderer)*

Return a *Bbox* object bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

*renderer* defaults to the *\_renderer* attribute of the text object. This is not assigned until the first execution of *draw()*, so you must use this kwarg if you want to call *get\_window\_extent* prior to the first *draw*. For getting web page regions, it is simpler to call the method after saving the figure.

*dpi* defaults to *self.figure.dpi*; the *renderer dpi* is irrelevant. For the web application, if *figure.dpi* is not the value used when saving the figure, then the value that was used must be specified as the *dpi* argument.

**mpl\_toolkits.axisartist.axis\_artist.TickLabels**

```
class mpl_toolkits.axisartist.axis_artist.TickLabels(*, axis_direction='bottom',
                                                    **kwargs)
```

Bases: *mpl\_toolkits.axisartist.axis\_artist.AxisLabel*, *mpl\_toolkits.axisartist.axis\_artist.AttributeCopier*

*Tick Labels*. While derived from *Text*, this single artist draws all ticklabels. As in *AxisLabel*, the position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal *Text*. Unlike the ticklabels of the mainline *matplotlib*, properties of single ticklabel alone cannot be modified.

To change the pad between ticks and ticklabels, use *set\_pad*.

`draw(renderer)`  
 Draws the *Text* object to the given *renderer*.

`get_ref_artist()`

`get_texts_widths_heights_descents(renderer)`  
 return a list of width, height, descent for ticklabels.

`get_window_extents(renderer)`

`invert_axis_direction()`

`set_axis_direction(label direction)`  
 Adjust the text angle and text alignment of ticklabels according to the matplotlib convention.  
 The *label\_direction* must be one of [left, right, bottom, top].

property	left	bottom	right	top
ticklabels angle	90	0	-90	180
ticklabel va	center	baseline	center	baseline
ticklabel ha	right	center	right	center

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_locs_angles_labels(locs_angles_labels)`

#### `mpl_toolkits.axisartist.axis_artist.Ticks`

```
class mpl_toolkits.axisartist.axis_artist.Ticks(ticksize, tick_out=False, *,
        axis=None, **kwargs)
```

Bases: `matplotlib.lines.Line2D`, `mpl_toolkits.axisartist.axis_artist.AttributeCopier`

Ticks are derived from `Line2D`, and note that ticks themselves are markers. Thus, you should use `set_mec`, `set_mew`, etc.

To change the tick size (length), you need to use `set_ticksize`. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use `set_tick_out(False)`.

`draw(renderer)`  
 draw the Line with *renderer* unless visibility is `False`

`get_color()`

`get_markeredgecolor()`

`get_markeredgewidth()`

`get_ref_artist()`

`get_tick_out()`  
 Return `True` if the tick will be rotated by 180 degree.

`get_ticksize()`  
 Return length of the ticks in points.

`set_locs_angles(locs_angles)`

`set_tick_out(b)`  
 set True if tick need to be rotated by 180 degree.

`set_ticksize(ticksize)`  
 set length of the ticks in points.

## `mpl_toolkits.axisartist.axisline_style`

### Classes

---

*AxislineStyle*

*AxislineStyle* is a container class which defines style classes for AxisArtists.

---

### `mpl_toolkits.axisartist.axisline_style.AxislineStyle`

`class mpl_toolkits.axisartist.axisline_style.AxislineStyle`  
 Bases: `matplotlib.patches._Style`

*AxislineStyle* is a container class which defines style classes for AxisArtists.

An instance of any axisline style class is a callable object, whose call signature is

```
__call__(self, axis_artist, path, transform)
```

When called, this should return a mpl artist with following methods implemented.

```
def set_path(self, path):
    # set the path for axisline.

def set_line_mutation_scale(self, scale):
    # set the scale

def draw(self, renderer):
    # draw
```

return the instance of the subclass with the given style name.

`class FilledArrow(size=1)`  
 Bases: `mpl_toolkits.axisartist.axisline_style.SimpleArrow`

**size** size of the arrow as a fraction of the ticklabel size.

`ArrowAxisClass`  
 alias of `_FancyAxislineStyle.FilledArrow`

`class SimpleArrow(size=1)`  
 Bases: `mpl_toolkits.axisartist.axisline_style._Base`

A simple arrow.

**size** size of the arrow as a fraction of the ticklabel size.

`ArrowAxisClass`  
 alias of `_FancyAxislineStyle.SimpleArrow`

`new_line(axis_artist, transform)`

**mpl\_toolkits.axisartist.axislines**

Axislines includes modified implementation of the Axes class. The biggest difference is that the artists responsible for drawing the axis spine, ticks, ticklabels and axis labels are separated out from mpl's Axis class. Originally, this change was motivated to support curvilinear grid. Here are a few reasons that I came up with a new axes class:

- "top" and "bottom" x-axis (or "left" and "right" y-axis) can have different ticks (tick locations and labels). This is not possible with the current mpl, although some twin axes trick can help.
- Curvilinear grid.
- angled ticks.

In the new axes class, xaxis and yaxis is set to not visible by default, and new set of artist (AxisArtist) are defined to draw axis line, ticks, ticklabels and axis label. Axes.axis attribute serves as a dictionary of these artists, i.e., ax.axis["left"] is a AxisArtist instance responsible to draw left y-axis. The default Axes.axis contains "bottom", "left", "top" and "right".

AxisArtist can be considered as a container artist and has following children artists which will draw ticks, labels, etc.

- line
- major\_ticks, major\_ticklabels
- minor\_ticks, minor\_ticklabels
- offsetText
- label

Note that these are separate artists from Axis class of the original mpl, thus most of tick-related command in the original mpl won't work, although some effort has made to work with. For example, color and markerwidth of the ax.axis["bottom"].major\_ticks will follow those of Axes.xaxis unless explicitly specified.

In addition to AxisArtist, the Axes will have *gridlines* attribute, which obviously draws grid lines. The gridlines needs to be separated from the axis as some gridlines can never pass any axis.

**Classes**

<i>Axes</i> (*args[, grid_helper])	
<i>AxesZero</i> (*args[, grid_helper])	
<i>AxisArtistHelper</i>	AxisArtistHelper should define following method with given APIs.
<i>AxisArtistHelperRectilinear</i>	
<i>GridHelperBase</i> ()	
<i>GridHelperRectilinear</i> (axes)	
<i>SimpleChainedObjects</i> (objects)	

**mpl\_toolkits.axisartist.axislines.Axes**

```
class mpl_toolkits.axisartist.axislines.Axes(*args, grid_helper=None, **kwargs)
    Bases: matplotlib.axes._axes.Axes
```

```
class AxisDict() -> new empty dictionary dict(mapping) -> new dictionary initial-
    ized from a mapping object's (key, value) pairs dict(iterable) -> new
    dictionary initialized as if via: d = {} for k, v in iterable: d[k] = v
    dict(**kwargs) -> new dictionary initialized with the name=value
    pairs in the keyword argument list. For example: dict(one=1,
    two=2)
```

Bases: dict

axis

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis(list_arg)
xmin, xmax, ymin, ymax = axis(string_arg)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

### Parameters

**v** [List[float] or one of the strings listed below.] Optional positional-only argument

If a list, set the axis data limits. If a string:

Value	Description
'on'	Turn on axis lines and labels.
'off'	Turn off axis lines and labels.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box.
'tight'	Set limits just large enough to show all data.
'auto'	Automatic scaling (fill plot box with data).
'normal'	Same as 'auto'; deprecated.
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing $x_{max}-x_{min} = y_{max}-y_{min}$ .

**emit** [bool, optional] Passed to `set_{x,y}lim` functions, if observers are notified of axis limit change.

**xmin, ymin, xmax, ymax** [float, optional] The axis limits to be set.

### Returns

**xmin, xmax, ymin, ymax** [float] The axis limits.

### See also:

`matplotlib.axes.Axes.set_xlim`, `matplotlib.axes.Axes.set_ylim`

`cla()`

Clear the current axes.

`draw(renderer, inframe=False)`

Draw everything (plot lines, axes, labels)

```

get_children()
    return a list of child artists

get_grid_helper()

get_tightbbox(renderer, call_axes_locator=True)
    Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

    Artists that have artist.set_in_layout(False) are not included in the bbox.

```

### Parameters

**renderer** [*RendererBase* instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**bbox\_extra\_artists** [list of *Artist* or *None*] List of artists to include in the tight bounding box. If *None* (default), then all artist children of the axes are included in the tight bounding box.

**call\_axes\_locator** [boolean (default *True*)] If *call\_axes\_locator* is *False*, it does not call the `_axes_locator` attribute, which is necessary to get the correct bounding box. `call_axes_locator=False` can be used if the caller is only interested in the relative size of the tightbbox compared to the axes bbox.

### Returns

**bbox** [*BboxBase*] bounding box in figure pixel coordinates.

```

grid(b=None, which='major', axis='both', **kwargs)
    Toggle the gridlines, and optionally set the properties of the lines.

invalidate_grid_helper()

new_fixed_axis(loc, offset=None)

new_floating_axis(nth_coord, value, axis_direction='bottom')

new_gridlines(grid_helper=None)
    Create and return a new GridlineCollection instance.

    which : "major" or "minor" axis : "both", "x" or "y"

toggle_axisline(b=None)

```

### `mpl_toolkits.axisartist.axislines.AxesZero`

```

class mpl_toolkits.axisartist.axislines.AxesZero(*args, grid_helper=None, **kwargs)
    Bases: mpl_toolkits.axisartist.axislines.Axes

```

### `mpl_toolkits.axisartist.axislines.AxisArtistHelper`

```

class mpl_toolkits.axisartist.axislines.AxisArtistHelper
    Bases: object

```

`AxisArtistHelper` should define following method with given APIs. Note that the first axes argument will be axes attribute of the caller artist.:

```

# LINE (spinal line?)

def get_line(self, axes):
    # path : Path
    return path

def get_line_transform(self, axes):
    # ...
    # trans : transform
    return trans

# LABEL

def get_label_pos(self, axes):
    # x, y : position
    return (x, y), trans

def get_label_offset_transform(self, axes,
                               pad_points, fontprops, renderer,
                               bboxes,
                               ):
    # va : vertical alignment
    # ha : horizontal alignment
    # a : angle
    return trans, va, ha, a

# TICK

def get_tick_transform(self, axes):
    return trans

def get_tick_iterators(self, axes):
    # iter : iterable object that yields (c, angle, l) where
    # c, angle, l is position, tick angle, and label

    return iter_major, iter_minor

```

```
class Fixed(loc, nth_coord=None)
```

```
    Bases: mpl_toolkits.axisartist.axislines._Base
```

Helper class for a fixed (in the axes coordinate) axis.

nth\_coord = along which coordinate value varies in 2d, nth\_coord = 0 -> x axis,

nth\_coord = 1 -> y axis

```
    get_axislabel_pos_angle(axes)
```

label reference position in transAxes.

get\_label\_transform() returns a transform of (transAxes+offset)

```
    get_axislabel_transform(axes)
```

```
    get_line(axes)
```

```
    get_line_transform(axes)
```

```
    get_nth_coord()
```

```
    get_tick_transform(axes)
```

```
class Floating(nth_coord, value)
    Bases: mpl_toolkits.axisartist.axislines._Base
    get_line(axes)
    get_nth_coord()
```

### **mpl\_toolkits.axisartist.axislines.AxisArtistHelperRectlinear**

```
class mpl_toolkits.axisartist.axislines.AxisArtistHelperRectlinear
    Bases: object
    class Fixed(axes, loc, nth_coord=None)
        Bases: mpl_toolkits.axisartist.axislines.Fixed
        nth_coord = along which coordinate value varies in 2d, nth_coord = 0 -> x axis,
        nth_coord = 1 -> y axis
        get_tick_iterators(axes)
            tick_loc, tick_angle, tick_label
    class Floating(axes, nth_coord, passingthrough_point, axis_direction='bottom')
        Bases: mpl_toolkits.axisartist.axislines.Floating
        get_axislabel_pos_angle(axes)
            label reference position in transAxes.
            get_label_transform() returns a transform of (transAxes+offset)
        get_axislabel_transform(axes)
        get_line(axes)
        get_line_transform(axes)
        get_tick_iterators(axes)
            tick_loc, tick_angle, tick_label
        get_tick_transform(axes)
```

### **mpl\_toolkits.axisartist.axislines.GridHelperBase**

```
class mpl_toolkits.axisartist.axislines.GridHelperBase
    Bases: object
    get_gridlines(which, axis)
        Return list of grid lines as a list of paths (list of points).
        which : "major" or "minor" axis : "both", "x" or "y"
    invalidate()
    new_gridlines(ax)
        Create and return a new GridlineCollection instance.
        which : "major" or "minor" axis : "both", "x" or "y"
    update_lim(axes)
    valid()
```

**mpl\_toolkits.axisartist.axislines.GridHelperRectlinear**

```
class mpl_toolkits.axisartist.axislines.GridHelperRectlinear(axes)
    Bases: mpl_toolkits.axisartist.axislines.GridHelperBase
    get_gridlines(which='major', axis='both')
        return list of gridline coordinates in data coordinates.
        which : "major" or "minor" axis : "both", "x" or "y"
    new_fixed_axis(loc, nth_coord=None, axis_direction=None, offset=None,
                  axes=None)
    new_floating_axis(nth_coord, value, axis_direction='bottom', axes=None)
```

**mpl\_toolkits.axisartist.axislines.SimpleChainedObjects**

```
class mpl_toolkits.axisartist.axislines.SimpleChainedObjects(objects)
    Bases: object
```

**mpl\_toolkits.axisartist.clip\_path****Functions**

---

```
atan2(dy, dx)
clip(xlines, ylines, x0[, clip, xdir, ydir])
clip_line_to_rect(xline, yline, bbox)
```

---

**mpl\_toolkits.axisartist.clip\_path.atan2**

```
mpl_toolkits.axisartist.clip_path.atan2(dy, dx)
```

**mpl\_toolkits.axisartist.clip\_path.clip**

```
mpl_toolkits.axisartist.clip_path.clip(xlines, ylines, x0, clip='right', xdir=True,
                                       ydir=True)
```

**mpl\_toolkits.axisartist.clip\_path.clip\_line\_to\_rect**

```
mpl_toolkits.axisartist.clip_path.clip_line_to_rect(xline, yline, bbox)
```

**mpl\_toolkits.axisartist.floating\_axes**

An experimental support for curvilinear grid.

## Classes

---

<i>ExtremeFinderFixed</i> ( <i>extremes</i> )		
<i>FixedAxisArtistHelper</i> ( <i>grid_helper</i> , <i>side</i> [, <i>nth_coord</i> = along which coordinate value varies. ...])

### `mpl_toolkits.axisartist.floating_axes.FloatingAxisArtistHelper`

```
class mpl_toolkits.axisartist.floating_axes.FloatingAxisArtistHelper(grid_helper,  
                                                                    nth_coord,  
                                                                    value,  
                                                                    axis_direction=None)  
    Bases: mpl_toolkits.axisartist.grid_helper_curvelinear.FloatingAxisArtistHelper  
    nth_coord = along which coordinate value varies. nth_coord = 0 -> x axis,  
    nth_coord = 1 -> y axis
```

### `mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear`

```
class mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear(aux_trans,  
                                                                    extremes,  
                                                                    grid_locator1=None,  
                                                                    grid_locator2=None,  
                                                                    tick_formatter1=None,  
                                                                    tick_formatter2=None)  
    Bases: mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear
```

`aux_trans` : a transform from the source (curved) coordinate to target (rectilinear) coordinate. An instance of MPL's Transform (inverse transform should be defined) or a tuple of two callable objects which defines the transform and its inverse. The callables need take two arguments of array of source coordinates and should return two target coordinates: e.g.,  $x_2, y_2 = \text{trans}(x_1, y_1)$

```
get_boundary()  
    return Nx2 array of x,y coordinate of the boundary
```

```
get_data_boundary(side)  
    return v= 0 , nth=1
```

```
get_gridlines(which='major', axis='both')  
    Return list of grid lines as a list of paths (list of points).  
    which : "major" or "minor" axis : "both", "x" or "y"
```

```
new_fixed_axis(loc,    nth_coord=None,    axis_direction=None,    offset=None,  
              axes=None)
```

### Examples using `mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear`

- `sphx_glr_gallery_axisartist_demo_floating_axes.py`

### `mpl_toolkits.axisartist.grid_finder`

#### Classes

---

<code>DictFormatter(format_dict[, formatter])</code>	<code>format_dict</code> : dictionary for format strings to be used.
<code>ExtremeFinderSimple(nx, ny)</code>	
<code>FixedLocator(locs)</code>	
<code>FormatterPrettyPrint([useMathText])</code>	
<code>GridFinder(transform[, extreme_finder, ...])</code>	<code>transform</code> : transform from the image coordinate (which will be the <code>transData</code> of the axes to the world coordinate.
<code>GridFinderBase(extreme_finder, ...[, ...])</code>	the <code>transData</code> of the axes to the world coordinate.
<code>MaxNLocator([nbins, steps, trim, integer, ...])</code>	

---

### `mpl_toolkits.axisartist.grid_finder.DictFormatter`

```
class mpl_toolkits.axisartist.grid_finder.DictFormatter(format_dict,          formatter
                                                    formatter=None)
    Bases: object
    format_dict : dictionary for format strings to be used. formatter : fall-back formatter
```

#### Examples using `mpl_toolkits.axisartist.grid_finder.DictFormatter`

- `sphinx_glr_gallery_axisartist_demo_floating_axes.py`

### `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

```
class mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple(nx, ny)
    Bases: object
```

### `mpl_toolkits.axisartist.grid_finder.FixedLocator`

```
class mpl_toolkits.axisartist.grid_finder.FixedLocator(locs)
    Bases: object
    set_factor(f)
```

#### Examples using `mpl_toolkits.axisartist.grid_finder.FixedLocator`

- `sphinx_glr_gallery_axisartist_demo_floating_axes.py`

### `mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint`

```
class mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint(useMathText=True)
    Bases: object
```

**mpl\_toolkits.axisartist.grid\_finder.GridFinder**

```
class mpl_toolkits.axisartist.grid_finder.GridFinder(transform, extreme_finder=None,
                                                    grid_locator1=None,
                                                    grid_locator2=None,
                                                    tick_formatter1=None,
                                                    tick_formatter2=None)
```

Bases: *mpl\_toolkits.axisartist.grid\_finder.GridFinderBase*

transform : transform from the image coordinate (which will be the transData of the axes to the world coordinate.

or transform = (transform\_xy, inv\_transform\_xy)

locator1, locator2 : grid locator for 1st and 2nd axis.

**mpl\_toolkits.axisartist.grid\_finder.GridFinderBase**

```
class mpl_toolkits.axisartist.grid_finder.GridFinderBase(extreme_finder,
                                                         grid_locator1, grid_locator2,
                                                         tick_formatter1=None,
                                                         tick_formatter2=None)
```

Bases: *object*

the transData of the axes to the world coordinate. locator1, locator2 : grid locator for 1st and 2nd axis.

Derived must define "transform\_xy, inv\_transform\_xy" (may use update\_transform)

get\_grid\_info(x1, y1, x2, y2)

**lon\_values, lat\_values** [list of grid values. if integer is given,] rough number of grids in each direction.

update(\*\*kw)

update\_transform(aux\_trans)

**mpl\_toolkits.axisartist.grid\_finder.MaxNLocator**

```
class mpl_toolkits.axisartist.grid_finder.MaxNLocator(nbins=10, steps=None,
                                                       trim=True, integer=False, symmetric=False,
                                                       prune=None)
```

Bases: *matplotlib.ticker.MaxNLocator*

set\_factor(f)

**Examples using mpl\_toolkits.axisartist.grid\_finder.MaxNLocator**

- sphx\_glr\_gallery\_axisartist\_demo\_axis\_direction.py
- sphx\_glr\_gallery\_axisartist\_demo\_floating\_axes.py
- sphx\_glr\_gallery\_axisartist\_simple\_axis\_pad.py

`mpl_toolkits.axisartist.grid_helper_curvilinear`

An experimental support for curvilinear grid.

## Classes

---

<code>FixedAxisArtistHelper</code> ( <code>grid_helper</code> , <code>side</code> [, <code>...</code> ])	Helper class for a fixed axis.
<code>FloatingAxisArtistHelper</code> ( <code>grid_helper</code> , <code>...</code> [, <code>nth_coord</code> = along which coordinate value varies.	
<code>GridHelperCurveLinear</code> ( <code>aux_trans</code> [, <code>...</code> ])	<code>aux_trans</code> : a transform from the source (curved) coordinate to target (rectilinear) coordinate.

---

`mpl_toolkits.axisartist.grid_helper_curvilinear.FixedAxisArtistHelper`

```
class mpl_toolkits.axisartist.grid_helper_curvilinear.FixedAxisArtistHelper(grid_helper,
                                                                           side,
                                                                           nth_coord_ticks=None)
```

Bases: `mpl_toolkits.axisartist.axislines.Fixed`

Helper class for a fixed axis.

**`nth_coord` = along which coordinate value varies.** `nth_coord` = 0 -> x axis,  
`nth_coord` = 1 -> y axis

`change_tick_coord(coord_number=None)`

`get_tick_iterators(axes)`  
`tick_loc`, `tick_angle`, `tick_label`

`get_tick_transform(axes)`

`update_lim(axes)`

`mpl_toolkits.axisartist.grid_helper_curvilinear.FloatingAxisArtistHelper`

```
class mpl_toolkits.axisartist.grid_helper_curvilinear.FloatingAxisArtistHelper(grid_helper,
                                                                                nth_coord,
                                                                                value,
                                                                                axis_direction=None)
```

Bases: `mpl_toolkits.axisartist.axislines.Floating`

**`nth_coord` = along which coordinate value varies.** `nth_coord` = 0 -> x axis,  
`nth_coord` = 1 -> y axis

`get_axislabel_pos_angle(axes)`

`get_axislabel_transform(axes)`

`get_line(axes)`

`get_line_transform(axes)`

`get_tick_iterators(axes)`  
`tick_loc`, `tick_angle`, `tick_label`, (optionally) `tick_label`

```
get_tick_transform(axes)
set_extremes(e1, e2)
update_lim(axes)
```

#### `mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear`

```
class mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear(aux_trans,
                                                                              ex-
                                                                              treme_finder=None,
                                                                              grid_locator1=None,
                                                                              grid_locator2=None,
                                                                              tick_formatter1=None,
                                                                              tick_formatter2=None)
```

Bases: `mpl_toolkits.axisartist.axislines.GridHelperBase`

`aux_trans` : a transform from the source (curved) coordinate to target (rectilinear) coordinate. An instance of MPL's Transform (inverse transform should be defined) or a tuple of two callable objects which defines the transform and its inverse. The callables need take two arguments of array of source coordinates and should return two target coordinates.

e.g., `x2, y2 = trans(x1, y1)`

```
get_gridlines(which='major', axis='both')
```

Return list of grid lines as a list of paths (list of points).

`which` : "major" or "minor" axis : "both", "x" or "y"

```
get_tick_iterator(nth_coord, axis_side, minor=False)
```

```
new_fixed_axis(loc, nth_coord=None, axis_direction=None, offset=None,
               axes=None)
```

```
new_floating_axis(nth_coord, value, axes=None, axis_direction='bottom')
```

```
update_grid_finder(aux_trans=None, **kw)
```

#### `mpl_toolkits.axisartist.parasite_axes`

### 19.1.4 Matplotlib axes\_grid Toolkit

---

**Note:** AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of `axes_grid`. In more recent version, the toolkit has divided into two separate namespace (`axes_grid1` and `axisartist`). While `axes_grid` namespace is maintained for the backward compatibility, use of `axes_grid1` and `axisartist` is recommended. For the documentation on `axes_grid`, see the [previous version of the docs](#).

---

#### Matplotlib axes\_grid1 Toolkit

The matplotlib `mpl_toolkits.axes_grid1` toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the `aspect` parameter in matplotlib adjust the

position of the single axes, `axes_grid1` toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See *What is axes\_grid1 toolkit?* for a guide on the usage of `axes_grid1`.

**The submodules of the axes\_grid1 API are:**

<code>axes_grid1.anchored_artists</code>	
<code>axes_grid1.axes_divider</code>	The <code>axes_divider</code> module provides helper classes to adjust the positions of multiple axes at drawing time.
<code>axes_grid1.axes_grid</code>	
<code>axes_grid1.axes_rgb</code>	
<code>axes_grid1.axes_size</code>	provides a classes of simple units that will be used with <code>AxesDivider</code> class (or others) to determine the size of each axes.
<code>axes_grid1.colorbar</code>	Colorbar toolkit with two classes and a function:
<code>axes_grid1.inset_locator</code>	A collection of functions and objects for creating or placing inset axes.
<code>axes_grid1.mpl_axes</code>	
<code>axes_grid1.parasite_axes</code>	

**Matplotlib axisartist Toolkit**

The `axisartist` namespace includes a derived `Axis` implementation (`mpl_toolkits.axisartist.Axis`). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the `mpl`'s `Axis` class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of `axisartist` at the *axisartist* user guide.

**The submodules of the axisartist API are:**

---

<i>axisartist.angle_helper</i>	
<i>axisartist.axes_divider</i>	
<i>axisartist.axes_grid</i>	
<i>axisartist.axes_rgb</i>	
<i>axisartist.axis_artist</i>	axis_artist.py module provides axis-related artists.
<i>axisartist.axisline_style</i>	
<i>axisartist.axislines</i>	Axislines includes modified implementation of the Axes class.
<i>axisartist.clip_path</i>	
<i>axisartist.floating_axes</i>	An experimental support for curvilinear grid.
<i>axisartist.grid_finder</i>	
<i>axisartist.grid_helper_curvelinear</i>	An experimental support for curvilinear grid.
<i>axisartist.parasite_axes</i>	

---

## 19.2 mplot3d API

**Contents**

- *mplot3d API*
  - *axes3d*
  - *axis3d*
  - *art3d*
  - *Art3D Utility Functions*
  - *proj3d*

### 19.2.1 axes3d

---

**Note:** Significant effort went into bringing axes3d to feature-parity with regular axes objects for version 1.1.0. However, more work remains. Please report any functions that do not behave as expected as a bug. In addition, help and patches would be greatly appreciated!

---

---

<i>axes3d.Axes3D</i> (fig[, rect, azim, elev, ...])	3D axes object.
---	-----------------

---

**mpl\_toolkits.mplot3d.axes3d.Axes3D**

```
class mpl_toolkits.mplot3d.axes3d.Axes3D(fig, rect=None, *args, azimuth=-60,
                                         elev=30, zscale=None, sharez=None,
                                         proj_type='persp', **kwargs)
```

Bases: `matplotlib.axes._axes.Axes`

3D axes object.

```
add_collection3d(col, zs=0, zdir='z')
```

Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

**Supported are:**

- `PolyCollection`
- `LineCollection`
- `PatchCollection`

```
add_contour_set(cset, extend3d=False, stride=5, zdir='z', offset=None)
```

```
add_contourf_set(cset, zdir='z', offset=None)
```

```
auto_scale_xyz(X, Y, Z=None, had_data=None)
```

```
autoscale(enable=True, axis='both', tight=None)
```

Convenience method for simple axis view autoscaling. See `matplotlib.axes.Axes.autoscale()` for full explanation. Note that this function behaves the same, but for all three axes. Therefore, 'z' can be passed for *axis*, and 'both' applies to all three axes.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

```
autoscale_view(tight=None, scalex=True, scaley=True, scalez=True)
```

Autoscale the view limits using the data limits. See `matplotlib.axes.Axes.autoscale_view()` for documentation. Note that this function applies to the 3D axes, and as such adds the *scalez* to the function arguments.

Changed in version 1.1.0: Function signature was changed to better match the 2D version. *tight* is now explicitly a kwarg and placed first.

Changed in version 1.2.1: This is now fully functional.

```
bar(left, height, zs=0, zdir='z', *args, **kwargs)
```

Add 2D bar(s).

Argument	Description
<i>left</i>	The x coordinates of the left sides of the bars.
<i>height</i>	The height of the bars.
<i>zs</i>	Z coordinate of bars, if one value is specified they will all be placed at the same z.
<i>zdir</i>	Which direction to use as z ('x', 'y' or 'z') when plotting a 2D set.

Keyword arguments are passed onto `bar()`.

Returns a `Patch3DCollection`

`bar3d(x, y, z, dx, dy, dz, color=None, zsort='average', shade=True, *args, **kwargs)`

Generate a 3D barplot.

This method creates three dimensional barplot where the width, depth, height, and color of the bars can all be uniquely set.

### Parameters

**x, y, z** [array-like] The coordinates of the anchor point of the bars.

**dx, dy, dz** [scalar or array-like] The width, depth, and height of the bars, respectively.

**color** [sequence of valid color specifications, optional] The color of the bars can be specified globally or individually. This parameter can be:

- A single color value, to color all bars the same color.
- An array of colors of length N bars, to color each bar independently.
- An array of colors of length 6, to color the faces of the bars similarly.
- An array of colors of length 6 \* N bars, to color each face independently.

When coloring the faces of the boxes specifically, this is the order of the coloring:

1. -Z (bottom of box)
2. +Z (top of box)
3. -Y
4. +Y
5. -X
6. +X

**zsort** [str, optional] The z-axis sorting scheme passed onto `Poly3DCollection()`

**shade** [bool, optional (default = True)] When true, this shades the dark sides of the bars (relative to the plot's source of light).

**Any additional keyword arguments are passed onto**

**:func:'~mpl\_toolkits.mplot3d.art3d.Poly3DCollection'**

### Returns

**collection** [Poly3DCollection] A collection of three dimensional polygons representing the bars.

`can_pan()`

Return *True* if this axes supports the pan/zoom button functionality.

3D axes objects do not use the pan/zoom button.

`can_zoom()`

Return *True* if this axes supports the zoom box button functionality.

3D axes objects do not use the zoom box button.

`cla()`

Clear axes

`clabel(*args, **kwargs)`

This function is currently not implemented for 3D axes. Returns *None*.

`contour(X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)`

Create a 3D contour plot.

Argument	Description
<i>X, Y,</i>	Data values as <code>numpy.array</code> s
<i>Z</i>	
<i>extend3d</i>	Whether to extend contour in 3D (default: <code>False</code> )
<i>stride</i>	Stride (step size) for extending contour
<i>zdir</i>	The direction to use: <code>x</code> , <code>y</code> or <code>z</code> (default)
<i>offset</i>	If specified plot a projection of the contour lines on this position in plane normal to <code>zdir</code>

The positional and other keyword arguments are passed on to `contour()`

Returns a `contour`

`contour3D(X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)`

Create a 3D contour plot.

Argument	Description
<i>X, Y,</i>	Data values as <code>numpy.array</code> s
<i>Z</i>	
<i>extend3d</i>	Whether to extend contour in 3D (default: <code>False</code> )
<i>stride</i>	Stride (step size) for extending contour
<i>zdir</i>	The direction to use: <code>x</code> , <code>y</code> or <code>z</code> (default)
<i>offset</i>	If specified plot a projection of the contour lines on this position in plane normal to <code>zdir</code>

The positional and other keyword arguments are passed on to `contour()`

Returns a `contour`

`contourf(X, Y, Z, *args, zdir='z', offset=None, **kwargs)`

Create a 3D contourf plot.

Argument	Description
<i>X, Y,</i>	Data values as <code>numpy.array</code> s
<i>Z</i>	
<i>zdir</i>	The direction to use: <code>x</code> , <code>y</code> or <code>z</code> (default)
<i>offset</i>	If specified plot a projection of the filled contour on this position in plane normal to <code>zdir</code>

The positional and keyword arguments are passed on to `contourf()`

Returns a `contourf`

Changed in version 1.1.0: The `zdir` and `offset` kwargs were added.

`contourf3D(X, Y, Z, *args, zdir='z', offset=None, **kwargs)`

Create a 3D `contourf` plot.

Argument	Description
<code>X, Y,</code>	Data values as <code>numpy.array</code> s
<code>Z</code>	
<code>zdir</code>	The direction to use: <code>x</code> , <code>y</code> or <code>z</code> (default)
<code>offset</code>	If specified plot a projection of the filled contour on this position in plane normal to <code>zdir</code>

The positional and keyword arguments are passed on to `contourf()`

Returns a `contourf`

Changed in version 1.1.0: The `zdir` and `offset` kwargs were added.

`convert_zunits(z)`

For artists in an axes, if the zaxis has units support, convert `z` using zaxis unit type

New in version 1.2.1.

`disable_mouse_rotation()`

Disable mouse button callbacks.

`draw(renderer)`

Draw everything (plot lines, axes, labels)

`format_coord(xd, yd)`

Given the 2D view coordinates attempt to guess a 3D coordinate. Looks for the nearest edge to the point and then assumes that the point is at the same `z` location as the nearest point on the edge.

`format_zdata(z)`

Return `z` string formatted. This function will use the `fmt_zdata` attribute if it is callable, else will fall back on the zaxis major formatter

`get_autoscale_on()`

Get whether autoscaling is applied for all axes on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_autoscalez_on()`

Get whether autoscaling for the `z`-axis is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_axis_position()`

`get_children()`

return a list of child artists

`get_frame_on()`

Get whether the 3D axes panels are drawn.

New in version 1.1.0.

`get_proj()`

Create the projection matrix from the current viewing position.

`elev` stores the elevation angle in the z plane `azim` stores the azimuth angle in the x,y plane

`dist` is the distance of the eye viewing point from the object point.

`get_w_lims()`

Get 3D world limits.

`get_xlim()`

Get the x-axis range

#### Returns

**xlimits** [tuple] Returns the current x-axis limits as the tuple (`left`, `right`).

#### Notes

The x-axis may be inverted, in which case the `left` value will be greater than the `right` value.

Changed in version 1.1.0: This function now correctly refers to the 3D x-limits

`get_xlim3d()`

Get the x-axis range

#### Returns

**xlimits** [tuple] Returns the current x-axis limits as the tuple (`left`, `right`).

#### Notes

The x-axis may be inverted, in which case the `left` value will be greater than the `right` value.

Changed in version 1.1.0: This function now correctly refers to the 3D x-limits

`get_ylim()`

Get the y-axis range

#### Returns

**ylimits** [tuple] Returns the current y-axis limits as the tuple (`bottom`, `top`).

#### Notes

The y-axis may be inverted, in which case the `bottom` value will be greater than the `top` value.

Changed in version 1.1.0: This function now correctly refers to the 3D y-limits.

`get_ylim3d()`  
Get the y-axis range

### Returns

**ylimits** [tuple] Returns the current y-axis limits as the tuple (bottom, top).

### Notes

The y-axis may be inverted, in which case the `bottom` value will be greater than the `top` value.

Changed in version 1.1.0: This function now correctly refers to the 3D y-limits.

`get_zbound()`  
Returns the z-axis numerical bounds where:

<code>lowerBound &lt; upperBound</code>
---

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_zlabel()`  
Get the z-label text string.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_zlim()`  
Get 3D z limits.

`get_zlim3d()`  
Get 3D z limits.

`get_zmajorticklabels()`  
Get the ztick labels as a list of Text instances

New in version 1.1.0.

`get_zminorticklabels()`  
Get the ztick labels as a list of Text instances

---

**Note:** Minor ticks are not supported. This function was added only for completeness.

---

New in version 1.1.0.

`get_zscale()`

`get_zticklabels(minor=False)`  
Get ztick labels as a list of Text instances. See `matplotlib.axes.Axes.get_yticklabels()` for more details.

---

**Note:** Minor ticks are not supported.

---

New in version 1.1.0.

`get_zticklines()`

Get ztick lines as a list of Line2D instances. Note that this function is provided merely for completeness. These lines are re-calculated as the display changes.

New in version 1.1.0.

`get_zticks(minor=False)`

Return the z ticks as a list of locations See `matplotlib.axes.Axes.get_yticks()` for more details.

---

**Note:** Minor ticks are not supported.

---

New in version 1.1.0.

`grid(b=True, **kwargs)`

Set / unset 3D grid.

---

**Note:** Currently, this function does not behave the same as `matplotlib.axes.Axes.grid()`, but it is intended to eventually support that behavior.

---

Changed in version 1.1.0: This function was changed, but not tested. Please report any bugs.

`have_units()`

Return *True* if units are set on the x, y, or z axes

`invert_zaxis()`

Invert the z-axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`locator_params(axis='both', tight=None, **kwargs)`

Convenience method for controlling tick locators.

See `matplotlib.axes.Axes.locator_params()` for full documentation. Note that this is for Axes3D objects, therefore, setting *axis* to 'both' will result in the parameters being set for all three axes. Also, *axis* can also take a value of 'z' to apply parameters to the z axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`margins(*margins, x=None, y=None, z=None, tight=True)`

Convenience method to set or retrieve autoscaling margins.

**signatures::** `margins()`

returns xmargin, ymargin, zmargin

`margins(margin)`

(continues on next page)

(continued from previous page)

```
margins(xmargin, ymargin, zmargin)

margins(x=xmargin, y=ymargin, z=zmargin)

margins(..., tight=False)
```

All forms above set the `xmargin`, `ymargin` and `zmargin` parameters. All keyword parameters are optional. A single positional argument specifies `xmargin`, `ymargin` and `zmargin`. Passing both positional and keyword arguments for `xmargin`, `ymargin`, and/or `zmargin` is invalid.

The `tight` parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is `True`, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting `tight` to `None` will preserve the previous setting.

Specifying any margin changes only the autoscaling; for example, if `xmargin` is not `None`, then `xmargin` times the X data interval will be added to each end of that interval before it is used in autoscaling.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

```
mouse_init(rotate_btn=1, zoom_btn=3)
```

Initializes mouse button callbacks to enable 3D rotation of the axes. Also optionally sets the mouse buttons for 3D rotation and zooming.

Argument	Description
<code>rotate_btn</code>	The integer or list of integers specifying which mouse button or buttons to use for 3D rotation of the axes. Default = 1.
<code>zoom_btn</code>	The integer or list of integers specifying which mouse button or buttons to use to zoom the 3D axes. Default = 3.

```
name = '3d'
```

```
plot(xs, ys, *args, zdir='z', **kwargs)
```

Plot 2D or 3D data.

Argument	Description
<code>xs, ys</code>	x, y coordinates of vertices
<code>zs</code>	z value(s), either one for all points or one for each point.
<code>zdir</code>	Which direction to use as z ('x', 'y' or 'z') when plotting a 2D set.

Other arguments are passed on to `plot()`

```
plot3D(xs, ys, *args, zdir='z', **kwargs)
```

Plot 2D or 3D data.

Argument	Description
<code>xs, ys</code>	x, y coordinates of vertices
<code>zs</code>	z value(s), either one for all points or one for each point.
<code>zdir</code>	Which direction to use as z ('x', 'y' or 'z') when plotting a 2D set.

Other arguments are passed on to `plot()`

```
plot_surface(X, Y, Z, *args, norm=None, vmin=None, vmax=None, light-
            source=None, **kwargs)
```

Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports color mapping by supplying the *cmap* argument.

---

**Note:** The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

---

### Parameters

**X, Y, Z** [2d arrays] Data values.

**rcount, ccount** [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.

New in version 2.0.

**rstride, cstride** [int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 10.

'classic' mode uses a default of *rstride* = *cstride* = 10 instead of the new default of *rcount* = *ccount* = 50.

**color** [color-like] Color of the surface patches.

**cmap** [Colormap] Colormap of the surface patches.

**facecolors** [array-like of colors.] Colors of each individual patch.

**norm** [Normalize] Normalization for the colormap.

**vmin, vmax** [float] Bounds for the normalization.

**shade** [bool] Whether to shade the face colors.

**\*\*kwargs** : Other arguments are forwarded to *Poly3DCollection*.

```
plot_trisurf(*args, color=None, norm=None, vmin=None, vmax=None, light-
            source=None, **kwargs)
```

Argument	Description
<i>X, Y, Z</i>	Data values as 1D arrays
<i>color</i>	Color of the surface patches
<i>cmap</i>	A colormap for the surface patches.
<i>norm</i>	An instance of Normalize to map values to colors
<i>vmin</i>	Minimum value to map
<i>vmax</i>	Maximum value to map
<i>shade</i>	Whether to shade the facecolors

The (optional) triangulation can be specified in one of two ways; either:

```
plot_trisurf(triangulation, ...)
```

where triangulation is a *Triangulation* object, or:

```
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a *Triangulation* object will be created. See *Triangulation* for an explanation of these possibilities.

The remaining arguments are:

```
plot_trisurf(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation.

Other arguments are passed on to *Poly3DCollection*

### Examples:

New in version 1.2.0: This plotting function was added for the v1.2.0 release.

```
plot_wireframe(X, Y, Z, *args, **kwargs)
```

Plot a 3D wireframe.

---

**Note:** The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

---

### Parameters

**X, Y, Z** [2d arrays] Data values.

**rcount, ccount** [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.

New in version 2.0.

**rstride, cstride** [int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

'classic' mode uses a default of *rstride* = *cstride* = 1 instead of the new default of *rcount* = *ccount* = 50.

**\*\*kwargs** : Other arguments are forwarded to [Line3DCollection](#).

```
quiver(*args, length=1, arrow_length_ratio=0.3, pivot='tail', normalize=False,
      **kwargs)
```

Plot a 3D field of arrows.

call signatures:

```
quiver(X, Y, Z, U, V, W, **kwargs)
```

Arguments:

**X, Y, Z:** The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg)

**U, V, W:** The x, y and z components of the arrow vectors

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

Keyword arguments:

**length:** [1.0 | float] The length of each quiver, default to 1.0, the unit is the same with the axes

**arrow\_length\_ratio:** [0.3 | float] The ratio of the arrow head with respect to the quiver, default to 0.3

**pivot:** [ 'tail' | 'middle' | 'tip' ] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*. Default is 'tail'

**normalize:** bool When True, all of the arrows will be the same length. This defaults to False, where the arrows will be different lengths depending on the values of u,v,w.

Any additional keyword arguments are delegated to *LineCollection*

```
quiver3D(*args, length=1, arrow_length_ratio=0.3, pivot='tail', normalize=False,
        **kwargs)
```

Plot a 3D field of arrows.

call signatures:

```
quiver(X, Y, Z, U, V, W, **kwargs)
```

Arguments:

**X, Y, Z:** The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg)

**U, V, W:** The x, y and z components of the arrow vectors

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

Keyword arguments:

**length:** [1.0 | float] The length of each quiver, default to 1.0, the unit is the same with the axes

**arrow\_length\_ratio:** [0.3 | float] The ratio of the arrow head with respect to the quiver, default to 0.3

**pivot:** [ 'tail' | 'middle' | 'tip' ] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*. Default is 'tail'

**normalize:** bool When True, all of the arrows will be the same length. This defaults to False, where the arrows will be different lengths depending on the values of u,v,w.

Any additional keyword arguments are delegated to *LineCollection*

```
scatter(xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args, **kwargs)
```

Create a scatter plot.

Argument	Description
<i>xs</i> , <i>ys</i>	Positions of data points.
<i>zs</i>	Either an array of the same length as <i>xs</i> and <i>ys</i> or a single value to place all points in the same plane. Default is 0.
<i>zdir</i>	Which direction to use as z ('x', 'y' or 'z') when plotting a 2D set.
<i>s</i>	Size in points <sup>2</sup> . It is a scalar or an array of the same length as <i>x</i> and <i>y</i> .
<i>c</i>	A color. <i>c</i> can be a single color format string, or a sequence of color specifications of length <i>N</i> , or a sequence of <i>N</i> numbers to be mapped to colors using the <i>cmap</i> and <i>norm</i> specified via <i>kwargs</i> (see below). Note that <i>c</i> should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. <i>c</i> can be a 2-D array in which the rows are RGB or RGBA, however, including the case of a single row to specify the same color for all points.
<i>depthshade</i>	Whether or not to shade the scatter markers to give the appearance of depth. Default is <i>True</i> .

Keyword arguments are passed on to `scatter()`.

Returns a `Patch3DCollection`

```
scatter3D(xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args,
          **kwargs)
```

Create a scatter plot.

Argument	Description
<i>xs</i> , <i>ys</i>	Positions of data points.
<i>zs</i>	Either an array of the same length as <i>xs</i> and <i>ys</i> or a single value to place all points in the same plane. Default is 0.
<i>zdir</i>	Which direction to use as z ('x', 'y' or 'z') when plotting a 2D set.
<i>s</i>	Size in points <sup>2</sup> . It is a scalar or an array of the same length as <i>x</i> and <i>y</i> .
<i>c</i>	A color. <i>c</i> can be a single color format string, or a sequence of color specifications of length <i>N</i> , or a sequence of <i>N</i> numbers to be mapped to colors using the <i>cmap</i> and <i>norm</i> specified via <i>kwargs</i> (see below). Note that <i>c</i> should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. <i>c</i> can be a 2-D array in which the rows are RGB or RGBA, however, including the case of a single row to specify the same color for all points.
<i>depthshade</i>	Whether or not to shade the scatter markers to give the appearance of depth. Default is <i>True</i> .

Keyword arguments are passed on to `scatter()`.

Returns a `Patch3DCollection`

```
set_autoscale_on(b)
```

Set whether autoscaling is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

**Parameters****b** [bool]`set_autoscalez_on(b)`

Set whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

**Parameters****b** [bool]`set_axis_off()`

Turn off the axis.

`set_axis_on()`

Turn on the axis.

`set_frame_on(b)`

Set whether the 3D axes panels are drawn.

New in version 1.1.0.

**Parameters****b** [bool]`set_proj_type(proj_type)`

Set the projection type.

**Parameters****proj\_type** [str] Type of projection, accepts 'persp' and 'ortho'.`set_title(label, fontdict=None, loc='center', **kwargs)`

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

**Parameters****label** [str] Text to use for the title**fontdict** [dict] A dictionary controlling the appearance of the title text, the default fontdict is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight' : rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

**loc** [{'center', 'left', 'right'}, str, optional] Which title to set, defaults to 'center'**pad** [float] The offset of the title from the top of the axes, in points. Default is None to use rcParams['axes.titlepad'].**Returns****text** [*Text*] The matplotlib text instance representing the title**Other Parameters**

**\*\*kwargs** [*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

`set_top_view()`

`set_xlim(left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)`  
Set 3D x limits.

See `matplotlib.axes.Axes.set_xlim()` for full documentation.

`set_xlim3d(left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)`  
Set 3D x limits.

See `matplotlib.axes.Axes.set_xlim()` for full documentation.

`set_xscale(value, **kwargs)`  
Set the x-axis scale.

#### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] scaling strategy to apply

#### See also:

`matplotlib.scale.LinearScale` linear transform

`matplotlib.scale.LogTransform` log transform

`matplotlib.scale.SymmetricalLogTransform` symlog transform

`matplotlib.scale.LogisticTransform` logit transform .. versionadded :: 1.1.0 This function was added, but not tested. Please report any bugs.

#### Notes

Different kwargs are accepted, depending on the scale. See the `scale` module for more information.

`set_ylim(bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)`  
Set 3D y limits.

See `matplotlib.axes.Axes.set_ylim()` for full documentation.

`set_ylim3d(bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)`  
Set 3D y limits.

See `matplotlib.axes.Axes.set_ylim()` for full documentation.

`set_yscale(value, **kwargs)`  
Set the y-axis scale.

#### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] scaling strategy to apply

#### See also:

`matplotlib.scale.LinearScale` linear transform

`matplotlib.scale.LogTransform` log transform

`matplotlib.scale.SymmetricalLogTransform` symlog transform

`matplotlib.scale.LogisticTransform` logit transform .. versionadded :: 1.1.0 This function was added, but not tested. Please report any bugs.

## Notes

Different kwargs are accepted, depending on the scale. See the `scale` module for more information.

`set_zbound(lower=None, upper=None)`

Set the lower and upper numerical bounds of the z-axis. This method will honor axes inversion regardless of parameter order. It will not change the `_autoscaleZon` attribute.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`set_zlabel(zlabel, fontdict=None, labelpad=None, **kwargs)`

Set zlabel. See doc for `set_ylabel()` for description.

`set_zlim(bottom=None, top=None, emit=True, auto=False, *, zmin=None, zmax=None)`

Set 3D z limits.

See `matplotlib.axes.Axes.set_ylim()` for full documentation

`set_zlim3d(bottom=None, top=None, emit=True, auto=False, *, zmin=None, zmax=None)`

Set 3D z limits.

See `matplotlib.axes.Axes.set_ylim()` for full documentation

`set_zmargin(m)`

Set padding of Z data limits prior to autoscaling.

`m` times the data interval will be added to each end of that interval before it is used in autoscaling.

accepts: float in range 0 to 1

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`set_zscale(value, **kwargs)`

Set the scaling of the z-axis: 'linear' | 'log' | 'logit' | 'symlog'

ACCEPTS: ['linear' | 'log' | 'logit' | 'symlog']

**Different kwargs are accepted, depending on the scale:** 'linear'

'log'

**basex/basey:** The base of the logarithm

**nonposx/nonposy: {'mask', 'clip'}** non-positive values in x or y can be masked as invalid, or clipped to a very small positive number

**subsx/subsy:** Where to place the subticks between each major tick. Should be a sequence of integers. For example, in a log10 scale: [2, 3, 4, 5, 6, 7, 8, 9]

will place 8 logarithmically spaced minor ticks between each major tick.

'logit'

**nonpos: {'mask', 'clip'}** values beyond ]0, 1[ can be masked as invalid, or clipped to a number very close to 0 or 1

'symlog'

**basex/basey:** The base of the logarithm

**linthreshx/linthreshy:** A single float which defines the range (-x, x), within which the plot is linear. This avoids having the plot go to infinity around zero.

**subsx/subsy:** Where to place the subticks between each major tick. Should be a sequence of integers. For example, in a log10 scale: [2, 3, 4, 5, 6, 7, 8, 9]

will place 8 logarithmically spaced minor ticks between each major tick.

**linscalex/linscaley:** This allows the linear range (*linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

---

**Note:** Currently, Axes3D objects only supports linear scales. Other scales may or may not work, and support for these is improving with each release.

---

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`set_zticklabels(*args, **kwargs)`

Set z-axis tick labels. See `matplotlib.axes.Axes.set_yticklabels()` for more details.

---

**Note:** Minor ticks are not supported by Axes3D objects.

---

New in version 1.1.0.

`set_zticks(*args, **kwargs)`

Set z-axis tick locations. See `matplotlib.axes.Axes.set_yticks()` for more details.

---

**Note:** Minor ticks are not supported.

---

New in version 1.1.0.

`text(x, y, z, s, zdir=None, **kwargs)`

Add text to the plot. `kwargs` will be passed on to `Axes.text`, except for the `zdir` keyword, which sets the direction to be used as the z direction.

```
text2D(x, y, s, fontdict=None, withdash=False, **kwargs)
```

Add text to the axes.

Add the text *s* to the axes at location *x*, *y* in data coordinates.

### Parameters

**x, y** [scalars] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

**s** [str] The text.

**fontdict** [dictionary, optional, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by your rc parameters.

**withdash** [boolean, optional, default: False] Creates a *TextWithDash* instance instead of a *Text* instance.

### Returns

**text** [*Text*] The created *Text* instance.

### Other Parameters

**\*\*kwargs** [*Text* properties.] Other miscellaneous text parameters.

### Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords (0,0 is lower-left and 1,1 is upper-right). The example below places text in the center of the axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

```
text3D(x, y, z, s, zdir=None, **kwargs)
```

Add text to the plot. *kwargs* will be passed on to *Axes.text*, except for the *zdir* keyword, which sets the direction to be used as the *z* direction.

```
tick_params(axis='both', **kwargs)
```

Convenience method for changing the appearance of ticks and tick labels.

See *matplotlib.axes.Axes.tick\_params()* for more complete documentation.

The only difference is that setting *axis* to 'both' will mean that the settings are applied to all three axes. Also, the *axis* parameter also accepts a value of 'z', which would mean to apply to only the *z*-axis.

Also, because of how Axes3D objects are drawn very differently from regular 2D axes, some of these settings may have ambiguous meaning. For simplicity, the 'z' axis will accept settings as if it was like the 'y' axis.

**Note:** While this function is currently implemented, the core part of the Axes3D object may ignore some of these settings. Future releases will fix this. Priority will be given to those who file bugs.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`ticklabel_format(*, style="", scilimits=None, useOffset=None, axis='both')`  
 Convenience method for manipulating the ScalarFormatter used by default for linear axes in Axes3D objects.

See `matplotlib.axes.Axes.ticklabel_format()` for full documentation. Note that this version applies to all three axes of the Axes3D object. Therefore, the `axis` argument will also accept a value of 'z' and the value of 'both' will apply to all three axes.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`tricontour(*args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)`  
 Create a 3D contour plot.

Argument	Description
<code>X, Y,</code> <code>Z</code>	Data values as numpy.arrays
<code>extend3d</code>	Whether to extend contour in 3D (default: False)
<code>stride</code>	Stride (step size) for extending contour
<code>zdir</code>	The direction to use: x, y or z (default)
<code>offset</code>	If specified plot a projection of the contour lines on this position in plane normal to <code>zdir</code>

Other keyword arguments are passed on to `tricontour()`

Returns a `contour`

Changed in version 1.3.0: Added support for custom triangulations

EXPERIMENTAL: This method currently produces incorrect output due to a long-standing bug in 3D PolyCollection rendering.

`tricontourf(*args, zdir='z', offset=None, **kwargs)`  
 Create a 3D contourf plot.

Argument	Description
<code>X, Y,</code> <code>Z</code>	Data values as numpy.arrays
<code>zdir</code>	The direction to use: x, y or z (default)
<code>offset</code>	If specified plot a projection of the contour lines on this position in plane normal to <code>zdir</code>

Other keyword arguments are passed on to `tricontour()`

Returns a `contour`

Changed in version 1.3.0: Added support for custom triangulations

EXPERIMENTAL: This method currently produces incorrect output due to a long-standing bug in 3D PolyCollection rendering.

`tunit_cube(vals=None, M=None)`

`tunit_edges(vals=None, M=None)`

`unit_cube(vals=None)`

`update_datalim(xys, **kwargs)`

Update the data lim bbox with seq of xy tups or equiv. 2-D array

`view_init(elev=None, azim=None)`

Set the elevation and azimuth of the axes.

This can be used to rotate the axes programmatically.

'elev' stores the elevation angle in the z plane. 'azim' stores the azimuth angle in the x,y plane.

if elev or azim are None (default), then the initial value is used which was specified in the `Axes3D` constructor.

`voxels([x, y, z], /, filled, **kwargs)`

Plot a set of filled voxels

All voxels are plotted as 1x1x1 cubes on the axis, with filled[0,0,0] placed with its lower corner at the origin. Occluded faces are not plotted.

Call signatures:

```
voxels(filled, facecolors=fc, edgecolors=ec, **kwargs)
voxels(x, y, z, filled, facecolors=fc, edgecolors=ec, **kwargs)
```

New in version 2.1.

### Parameters

**filled** [3D np.array of bool] A 3d array of values, with truthy values indicating which voxels to fill

**x, y, z** [3D np.array, optional] The coordinates of the corners of the voxels. This should broadcast to a shape one larger in every dimension than the shape of `filled`. These can be used to plot non-cubic voxels.

If not specified, defaults to increasing integers along each axis, like those returned by `indices()`. As indicated by the / in the function signature, these arguments can only be passed positionally.

**facecolors, edgecolors** [array\_like, optional] The color to draw the faces and edges of the voxels. Can only be passed as keyword arguments. This parameter can be:

- A single color value, to color all voxels the same color. This can be either a string, or a 1D rgb/rgba array
- None, the default, to use a single color for the faces, and the style default for the edges.

- A 3D ndarray of color names, with each item the color for the corresponding voxel. The size must match the voxels.
- A 4D ndarray of rgb/rgba data, with the components along the last axis.

**\*\*kwargs** Additional keyword arguments to pass onto `Poly3DCollection()`

### Returns

**faces** [dict] A dictionary indexed by coordinate, where `faces[i,j,k]` is a `Poly3DCollection` of the faces drawn for the voxel `filled[i,j,k]`. If no faces were drawn for a given voxel, either because it was not asked to be drawn, or it is fully occluded, then `(i,j,k)` not in `faces`.

### Examples

`zaxis_date(tz=None)`

Sets up z-axis ticks and labels that treat the z data as dates.

`tz` is a timezone string or `tzinfo` instance. Defaults to rc value.

---

**Note:** This function is merely provided for completeness. `Axes3D` objects do not officially support dates for ticks, and so this may or may not work as expected.

---

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`zaxis_inverted()`

Returns True if the z-axis is inverted.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

## 19.2.2 axis3d

---

**Note:** See `mpl_toolkits.mplot3d.axis3d._axinfo` for a dictionary containing constants that may be modified for controlling the look and feel of mplot3d axes (e.g., label spacing, font colors and panel colors). Historically, axis3d has suffered from having hard-coded constants that precluded user adjustments, and this dictionary was implemented in version 1.1 as a stop-gap measure.

---

---

```
axis3d.Axis(adir, v_intervalx, d_intervalx,
...)
```

---

### `mpl_toolkits.mplot3d.axis3d.Axis`

```
class mpl_toolkits.mplot3d.axis3d.Axis(adir, v_intervalx, d_intervalx, axes, *args, rotate_label=None, **kwargs)
```

1958 Bases: `matplotlib.axis.XAxis`

Chapter 19. Toolkits

```
draw(renderer)
```

Draw the axis lines, grid lines, tick lines and labels

`set_view_interval(vmin, vmax, ignore=False)`

If *ignore* is *False*, the order of *vmin*, *vmax* does not matter; the original axis orientation will be preserved. In addition, the view limits can be expanded, but will not be reduced. This method is for `mpl` internal use; for normal use, see `set_xlim()`.

### 19.2.3 `art3d`

<code>art3d.Line3D(xs, ys, zs, *args, **kwargs)</code>	3D line object.
<code>art3d.Line3DCollection(segments[, ...])</code>	A collection of 3D lines.
<code>art3d.Patch3D(*args[, zs, zdir])</code>	3D patch object.
<code>art3d.Patch3DCollection(*args[, zs, zdir, ...])</code>	A collection of 3D patches.
<code>art3d.Path3DCollection(*args[, zs, zdir, ...])</code>	A collection of 3D paths.
<code>art3d.PathPatch3D(path, *[, zs, zdir])</code>	3D PathPatch object.
<code>art3d.Poly3DCollection(verts, *args[, zsort])</code>	A collection of 3D polygons.
<code>art3d.Text3D([x, y, z, text, zdir])</code>	Text object with 3D position and direction.

#### `mpl_toolkits.mplot3d.art3d.Line3D`

`class mpl_toolkits.mplot3d.art3d.Line3D(xs, ys, zs, *args, **kwargs)`

Bases: `matplotlib.lines.Line2D`

3D line object.

Keyword arguments are passed onto `Line2D()`.

`draw(renderer)`

19.2. `mpl_toolkits.mplot3d` API 1959

`set_3d_properties(zs=0, zdir='z')`

**antialiaseds** [sequence, optional] A sequence of ones or zeros.

**linestyles** [string, tuple, optional] Either one of [ 'solid' | 'dashed' | 'dash-dot' | 'dotted' ], or a dash tuple. The dash tuple is:

```
(offset, onoffseq)
```

where `onoffseq` is an even length tuple of on and off ink in points.

**norm** [Normalize, optional] *Normalize* instance.

**cmap** [string or Colormap, optional] Colormap name or *Colormap* instance.

**pickradius** [float, optional] The tolerance in points for mouse clicks picking a line. Default is 5 pt.

**zorder** [int, optional] zorder of the LineCollection. Default is 2.

**facecolors** [optional] The facecolors of the LineCollection. Default is 'none'. Setting to a value other than 'none' will lead to a filled polygon being drawn between points on each line.

#### Notes

If `linewidths`, `colors`, or `antialiaseds` is None, they default to their rcParams setting, in sequence form.

If *offsets* and *transOffset* are not None, then *offsets* are transformed by *transOffset* and applied after the segments have been transformed to display coordinates.

If *offsets* is not None but *transOffset* is None, then the *offsets* are added to the segments before any transformation. In this case, a single offset can be specified as:

```
offsets=(xo,yo)
```

and this value will be added cumulatively to each successive segment, so as to produce a set of successively offset curves.

The use of *ScalarMappable* is optional. If the *ScalarMappable* array *\_A* is not None (i.e., a call to *set\_array()* has been made), at draw time a call to scalar mappable will be made to set the colors.

`do_3d_projection(renderer)`

Project the points according to renderer matrix.

`draw(renderer, project=False)`

Derived classes drawing method

`set_segments(segments)`

Set 3D segments.

`set_sort_zpos(val)`

Set the position to use for z-sorting.

### `mpl_toolkits.mplot3d.art3d.Patch3D`

```
class mpl_toolkits.mplot3d.art3d.Patch3D(*args, zs=(), zdir='z', **kwargs)
```

Bases: `matplotlib.patches.Patch`

3D patch object.

`do_3d_projection(renderer)`

`get_facecolor()`

Return the face color of the Patch.

`get_path()`

Return the path of this patch

`set_3d_properties(verts, zs=0, zdir='z')`

### `mpl_toolkits.mplot3d.art3d.Patch3DCollection`

```
class mpl_toolkits.mplot3d.art3d.Patch3DCollection(*args, zs=0, zdir='z',
                                                    depthshade=True, **kwargs)
```

Bases: `matplotlib.collections.PatchCollection`

A collection of 3D patches.

Create a collection of flat 3D patches with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for *PatchCollection*. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

```
do_3d_projection(renderer)
```

```
set_3d_properties(zs, zdir)
```

```
set_sort_zpos(val)
```

Set the position to use for z-sorting.

### **mpl\_toolkits.mplot3d.art3d.Path3DCollection**

```
class mpl_toolkits.mplot3d.art3d.Path3DCollection(*args, zs=0, zdir='z',  
                                                  depthshade=True, **kwargs)
```

Bases: *matplotlib.collections.PathCollection*

A collection of 3D paths.

Create a collection of flat 3D paths with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for *PathCollection*. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

```
do_3d_projection(renderer)
```

```
set_3d_properties(zs, zdir)
```

```
set_sort_zpos(val)
```

Set the position to use for z-sorting.

### **mpl\_toolkits.mplot3d.art3d.PathPatch3D**

```
class mpl_toolkits.mplot3d.art3d.PathPatch3D(path, *, zs=(), zdir='z', **kwargs)
```

Bases: *mpl\_toolkits.mplot3d.art3d.Patch3D*

3D PathPatch object.

```
do_3d_projection(renderer)
```

```
set_3d_properties(path, zs=0, zdir='z')
```

### **mpl\_toolkits.mplot3d.art3d.Poly3DCollection**

```
class mpl_toolkits.mplot3d.art3d.Poly3DCollection(verts, *args, zsort=True, **kwargs)
```

Bases: *matplotlib.collections.PolyCollection*

A collection of 3D polygons.

Create a Poly3DCollection.

*verts* should contain 3D coordinates.

Keyword arguments: `zsort`, see `set_zsort` for options.

Note that this class does a bit of magic with the `_facecolors` and `_edgecolors` properties.

`do_3d_projection(renderer)`  
Perform the 3D projection for this object.

`get_edgecolor()`

`get_facecolor()`

`get_vector(segments3d)`  
Optimize points for projection.

`set_3d_properties()`

`set_alpha(alpha)`  
Set the alpha transparencies of the collection.

#### Parameters

**alpha** [float or None]

`set_edgecolor(colors)`  
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

#### Parameters

**c** [color or sequence of colors]

`set_facecolor(colors)`  
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or sequence of colors]

`set_sort_zpos(val)`  
Set the position to use for z-sorting.

`set_verts(verts, closed=True)`  
Set 3D vertices.

`set_verts_and_codes(verts, codes)`  
Sets 3D vertices with path codes.

`set_zsort(zsort)`  
Sets the calculation method for the z-order.

#### Parameters

**zsort** [bool or {'average', 'min', 'max'}] For 'average', 'min', 'max' the z-order is determined by applying the function to the z-coordinates of the vertices in the viewer's coordinate system. *True* is equivalent to 'average'.

`mpl_toolkits.mplot3d.art3d.Text3D`

```
class mpl_toolkits.mplot3d.art3d.Text3D(x=0, y=0, z=0, text="", zdir='z', **kwargs)
```

Bases: `matplotlib.text.Text`

Text object with 3D position and direction.

**Parameters**

**x, y, z** The position of the text.

**text** [str] The text string to display.

**zdir** [{'x', 'y', 'z', None, 3-tuple}] The direction of the text. See `get_dir_vector` for a description of the values.

**Other Parameters**

**\*\*kwargs** All other parameters are passed on to `Text`.

```
draw(renderer)
```

Draws the `Text` object to the given `renderer`.

```
set_3d_properties(z=0, zdir='z')
```

## 19.2.4 Art3D Utility Functions

<code>art3d.get_colors(c, num)</code>	Stretch the color argument to provide the required number <i>num</i> .
<code>art3d.get_dir_vector(zdir)</code>	Return a direction vector.
<code>art3d.get_patch_verts(patch)</code>	Return a list of vertices for the path of a patch.
<code>art3d.juggle_axes(xs, ys, zs, zdir)</code>	Reorder coordinates so that 2D xs, ys can be plotted in the plane orthogonal to zdir.
<code>art3d.line_2d_to_3d(line[, zs, zdir])</code>	Convert a 2D line to 3D.
<code>art3d.line_collection_2d_to_3d(col[, zs, zdir])</code>	Convert a <code>LineCollection</code> to a <code>Line3DCollection</code> object.
<code>art3d.norm_angle(a)</code>	Return the given angle normalized to $-180 < a \leq 180$ degrees.
<code>art3d.norm_text_angle(a)</code>	Return the given angle normalized to $-90 < a \leq 90$ degrees.
<code>art3d.patch_2d_to_3d(patch[, z, zdir])</code>	Convert a <code>Patch</code> to a <code>Patch3D</code> object.
<code>art3d.patch_collection_2d_to_3d(col[, zs, ...])</code>	Convert a <code>PatchCollection</code> into a <code>Patch3DCollection</code> object (or a <code>PathCollection</code> into a <code>Path3DCollection</code> object).
<code>art3d.path_to_3d_segment(path[, zs, zdir])</code>	Convert a path to a 3D segment.
<code>art3d.path_to_3d_segment_with_codes(path[, ...])</code>	Convert a path to a 3D segment with path codes.
<code>art3d.pathpatch_2d_to_3d(pathpatch[, z, zdir])</code>	Convert a <code>PathPatch</code> to a <code>PathPatch3D</code> object.
<code>art3d.paths_to_3d_segments(paths[, zs, zdir])</code>	Convert paths from a collection object to 3D segments.
<code>art3d.paths_to_3d_segments_with_codes(paths)</code>	Convert paths from a collection object to 3D segments with path codes.

Continued on next page

Table 40 – continued from previous page

<code>art3d.poly_collection_2d_to_3d(col[, zs, zdir])</code>	Convert a PolyCollection to a Poly3DCollection object.
<code>art3d.rotate_axes(xs, ys, zs, zdir)</code>	Reorder coordinates so that the axes are rotated with zdir along the original z axis.
<code>art3d.text_2d_to_3d(obj[, z, zdir])</code>	Convert a Text to a Text3D object.
<code>art3d.zalpha(colors, zs)</code>	Modify the alphas of the color list according to depth.

**mpl\_toolkits.mplot3d.art3d.get\_colors**

`mpl_toolkits.mplot3d.art3d.get_colors(c, num)`

Stretch the color argument to provide the required number *num*.

**mpl\_toolkits.mplot3d.art3d.get\_dir\_vector**

`mpl_toolkits.mplot3d.art3d.get_dir_vector(zdir)`

Return a direction vector.

**Parameters**

**zdir** [{*'x'*, *'y'*, *'z'*, None, 3-tuple}] The direction. Possible values are: - *'x'*: equivalent to (1, 0, 0) - *'y'*: equivalent to (0, 1, 0) - *'z'*: equivalent to (0, 0, 1) - *None*: equivalent to (0, 0, 0) - an iterable (x, y, z) is returned unchanged.

**Returns**

**x, y, z** [array-like] The direction vector. This is either a `numpy.array` or *zdir* itself if *zdir* is already a length-3 iterable.

**mpl\_toolkits.mplot3d.art3d.get\_patch\_verts**

`mpl_toolkits.mplot3d.art3d.get_patch_verts(patch)`

Return a list of vertices for the path of a patch.

**mpl\_toolkits.mplot3d.art3d.juggle\_axes**

`mpl_toolkits.mplot3d.art3d.juggle_axes(xs, ys, zs, zdir)`

Reorder coordinates so that 2D *xs*, *ys* can be plotted in the plane orthogonal to *zdir*. *zdir* is normally *x*, *y* or *z*. However, if *zdir* starts with a *'-'* it is interpreted as a compensation for `rotate_axes`.

**mpl\_toolkits.mplot3d.art3d.line\_2d\_to\_3d**

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d(line, zs=0, zdir='z')`

Convert a 2D line to 3D.

**mpl\_toolkits.mplot3d.art3d.line\_collection\_2d\_to\_3d**

`mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d(col, zs=0, zdir='z')`  
Convert a `LineCollection` to a `Line3DCollection` object.

**mpl\_toolkits.mplot3d.art3d.norm\_angle**

`mpl_toolkits.mplot3d.art3d.norm_angle(a)`  
Return the given angle normalized to  $-180 < a \leq 180$  degrees.

**mpl\_toolkits.mplot3d.art3d.norm\_text\_angle**

`mpl_toolkits.mplot3d.art3d.norm_text_angle(a)`  
Return the given angle normalized to  $-90 < a \leq 90$  degrees.

**mpl\_toolkits.mplot3d.art3d.patch\_2d\_to\_3d**

`mpl_toolkits.mplot3d.art3d.patch_2d_to_3d(patch, z=0, zdir='z')`  
Convert a `Patch` to a `Patch3D` object.

**mpl\_toolkits.mplot3d.art3d.patch\_collection\_2d\_to\_3d**

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d(col, zs=0, zdir='z',  
depthshade=True)`  
Convert a `PatchCollection` into a `Patch3DCollection` object (or a `PathCollection` into a `Path3DCollection` object).

**Parameters**

**za** The location or locations to place the patches in the collection along the `zdir` axis. Default: 0.

**zdir** The axis in which to place the patches. Default: "z".

**depthshade** Whether to shade the patches to give a sense of depth. Default: `True`.

**mpl\_toolkits.mplot3d.art3d.path\_to\_3d\_segment**

`mpl_toolkits.mplot3d.art3d.path_to_3d_segment(path, zs=0, zdir='z')`  
Convert a path to a 3D segment.

**mpl\_toolkits.mplot3d.art3d.path\_to\_3d\_segment\_with\_codes**

`mpl_toolkits.mplot3d.art3d.path_to_3d_segment_with_codes(path, zs=0, zdir='z')`  
Convert a path to a 3D segment with path codes.

**mpl\_toolkits.mplot3d.art3d.pathpatch\_2d\_to\_3d**

`mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d(pathpatch, z=0, zdir='z')`  
 Convert a PathPatch to a PathPatch3D object.

Examples using `mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d`

- `sphinx_glr_gallery_mplot3d_pathpatch3d.py`

**mpl\_toolkits.mplot3d.art3d.paths\_to\_3d\_segments**

`mpl_toolkits.mplot3d.art3d.paths_to_3d_segments(paths, zs=0, zdir='z')`  
 Convert paths from a collection object to 3D segments.

**mpl\_toolkits.mplot3d.art3d.paths\_to\_3d\_segments\_with\_codes**

`mpl_toolkits.mplot3d.art3d.paths_to_3d_segments_with_codes(paths, zs=0, zdir='z')`  
 Convert paths from a collection object to 3D segments with path codes.

**mpl\_toolkits.mplot3d.art3d.poly\_collection\_2d\_to\_3d**

`mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d(col, zs=0, zdir='z')`  
 Convert a PolyCollection to a Poly3DCollection object.

**mpl\_toolkits.mplot3d.art3d.rotate\_axes**

`mpl_toolkits.mplot3d.art3d.rotate_axes(xs, ys, zs, zdir)`  
 Reorder coordinates so that the axes are rotated with *zdir* along the original *z* axis. Prepending the axis with a '-' does the inverse transform, so *zdir* can be *x*, *-x*, *y*, *-y*, *z* or *-z*

**mpl\_toolkits.mplot3d.art3d.text\_2d\_to\_3d**

`mpl_toolkits.mplot3d.art3d.text_2d_to_3d(obj, z=0, zdir='z')`  
 Convert a Text to a Text3D object.

**mpl\_toolkits.mplot3d.art3d.zalpha**

`mpl_toolkits.mplot3d.art3d.zalpha(colors, zs)`  
 Modify the alphas of the color list according to depth.

**19.2.5 proj3d**

---

<code>proj3d.inv_transform(xs, ys, zs, M)</code>	
<code>proj3d.line2d(p0, p1)</code>	Return 2D equation of line in the form $ax+by+c = 0$
<code>proj3d.line2d_dist(l, p)</code>	Distance from line to point line is a tuple of coefficients a,b,c
<code>proj3d.line2d_seg_dist(p1, p2, p0)</code>	distance(s) from line defined by p1 - p2 to point(s) p0
<code>proj3d.mod(v)</code>	3d vector length
<code>proj3d.persp_transformation(zfront, zback)</code>	
<code>proj3d.proj_points(points, M)</code>	
<code>proj3d.proj_trans_clip_points(points, M)</code>	
<code>proj3d.proj_trans_points(points, M)</code>	
<code>proj3d.proj_transform(xs, ys, zs, M)</code>	Transform the points by the projection matrix
<code>proj3d.proj_transform_clip(xs, ys, zs, M)</code>	Transform the points by the projection matrix and return the clipping result returns txs,tys,tzs,tis
<code>proj3d.proj_transform_vec(vec, M)</code>	
<code>proj3d.proj_transform_vec_clip(vec, M)</code>	
<code>proj3d.rot_x(V, alpha)</code>	
<code>proj3d.transform(xs, ys, zs, M)</code>	Transform the points by the projection matrix
<code>proj3d.vec_pad_ones(xs, ys, zs)</code>	
<code>proj3d.view_transformation(E, R, V)</code>	
<code>proj3d.world_transformation(xmin, xmax, ...)</code>	

---

**mpl\_toolkits.mplot3d.proj3d.inv\_transform**

`mpl_toolkits.mplot3d.proj3d.inv_transform(xs, ys, zs, M)`

**mpl\_toolkits.mplot3d.proj3d.line2d**

`mpl_toolkits.mplot3d.proj3d.line2d(p0, p1)`  
 Return 2D equation of line in the form  $ax+by+c = 0$

**mpl\_toolkits.mplot3d.proj3d.line2d\_dist**

`mpl_toolkits.mplot3d.proj3d.line2d_dist(l, p)`  
 Distance from line to point line is a tuple of coefficients a,b,c

**mpl\_toolkits.mplot3d.proj3d.line2d\_seg\_dist**

`mpl_toolkits.mplot3d.proj3d.line2d_seg_dist(p1, p2, p0)`  
 distance(s) from line defined by p1 - p2 to point(s) p0  
 $p0[0] = x(s)$   $p0[1] = y(s)$   
 intersection point  $p = p1 + u*(p2-p1)$  and intersection point lies within segment if u is between 0 and 1

**mpl\_toolkits.mplot3d.proj3d.mod**

`mpl_toolkits.mplot3d.proj3d.mod(v)`  
3d vector length

**mpl\_toolkits.mplot3d.proj3d.persp\_transformation**

`mpl_toolkits.mplot3d.proj3d.persp_transformation(zfront, zback)`

**mpl\_toolkits.mplot3d.proj3d.proj\_points**

`mpl_toolkits.mplot3d.proj3d.proj_points(points, M)`

**mpl\_toolkits.mplot3d.proj3d.proj\_trans\_clip\_points**

`mpl_toolkits.mplot3d.proj3d.proj_trans_clip_points(points, M)`

**mpl\_toolkits.mplot3d.proj3d.proj\_trans\_points**

`mpl_toolkits.mplot3d.proj3d.proj_trans_points(points, M)`

**mpl\_toolkits.mplot3d.proj3d.proj\_transform**

`mpl_toolkits.mplot3d.proj3d.proj_transform(xs, ys, zs, M)`  
Transform the points by the projection matrix

**mpl\_toolkits.mplot3d.proj3d.proj\_transform\_clip**

`mpl_toolkits.mplot3d.proj3d.proj_transform_clip(xs, ys, zs, M)`  
Transform the points by the projection matrix and return the clipping result returns  
`txs, tys, tzs, tis`

**mpl\_toolkits.mplot3d.proj3d.proj\_transform\_vec**

`mpl_toolkits.mplot3d.proj3d.proj_transform_vec(vec, M)`

**mpl\_toolkits.mplot3d.proj3d.proj\_transform\_vec\_clip**

`mpl_toolkits.mplot3d.proj3d.proj_transform_vec_clip(vec, M)`

**mpl\_toolkits.mplot3d.proj3d.rot\_x**

`mpl_toolkits.mplot3d.proj3d.rot_x(V, alpha)`

**mpl\_toolkits.mplot3d.proj3d.transform**

`mpl_toolkits.mplot3d.proj3d.transform(xs, ys, zs, M)`  
Transform the points by the projection matrix

**mpl\_toolkits.mplot3d.proj3d.vec\_pad\_ones**

`mpl_toolkits.mplot3d.proj3d.vec_pad_ones(xs, ys, zs)`

**mpl\_toolkits.mplot3d.proj3d.view\_transformation**

`mpl_toolkits.mplot3d.proj3d.view_transformation(E, R, V)`

**mpl\_toolkits.mplot3d.proj3d.world\_transformation**

`mpl_toolkits.mplot3d.proj3d.world_transformation(xmin, xmax, ymin, ymax, zmin, zmax)`

## 19.3 Matplotlib axes\_grid Toolkit

---

**Note:** AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of *axes\_grid*. In more recent version, the toolkit has divided into two separate namespace (*axes\_grid1* and *axisartist*). While *axes\_grid* namespace is maintained for the backward compatibility, use of *axes\_grid1* and *axisartist* is recommended. For the documentation on *axes\_grid*, see the [previous version of the docs](#).

## **Part V**

# **Third party packages**

Several external packages that extend or build on Matplotlib functionality are listed below. They are maintained and distributed separately from Matplotlib and thus need to be installed individually.

Please submit an issue or pull request on Github if you have created a package that you would like to have included. We are also happy to host third party packages within the [Matplotlib Github Organization](#).

## MAPPING TOOLKITS

### 23.1 Basemap

Basemap plots data on map projections, with continental and political boundaries.

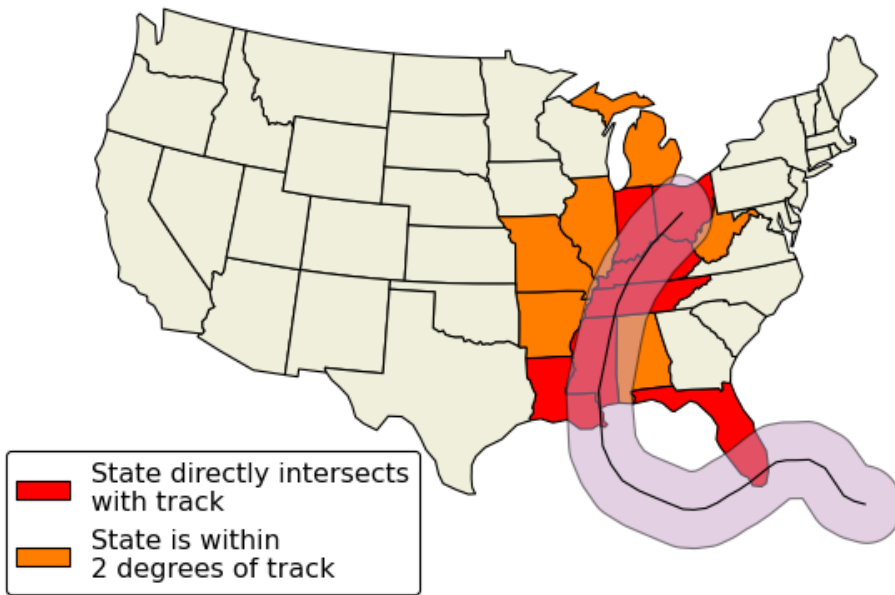

contour lines over filled continent background

### 23.2 Cartopy

[Cartopy](#) builds on top of Matplotlib to provide object oriented map projection definitions and close integration with Shapely for powerful yet easy-to-use vector data processing tools. An example plot from the [Cartopy gallery](#):

US States which intersect the track of Hurricane Katrina (2005)

## DECLARATIVE LIBRARIES

### 24.1 ggplot

`ggplot` is a port of the R `ggplot2` package to python based on Matplotlib.

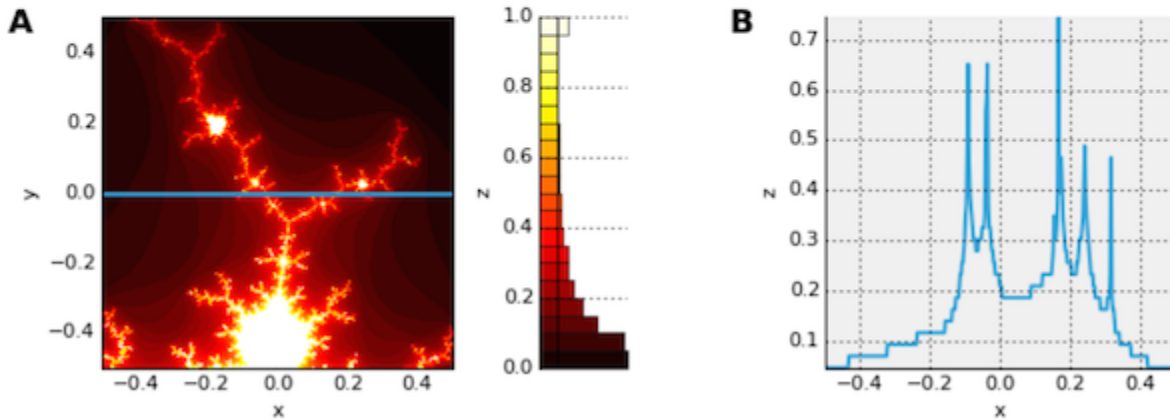

### 24.2 holoviews

`holoviews` makes it easier to visualize data interactively, especially in a [Jupyter notebook](#), by providing a set of declarative plotting objects that store your data and associated metadata. Your data is then immediately visualizable alongside or overlaid with other data, either statically or with automatically provided widgets for parameter exploration.

```
import numpy as np
import holoviews as hv
hv.notebook_extension('matplotlib')
fractal = hv.Image(np.load('mandelbrot.npy'))

((fractal * hv.HLine(y=0)).hist() + fractal.sample(y=0))
```

## 24.3 plotnine

`plotnine` implements a grammar of graphics, similar to R's `ggplot2`. The grammar allows users to compose plots by explicitly mapping data to the visual objects that make up the plot.

## SPECIALTY PLOTS

### 25.1 Broken Axes

`brokenaxes` supplies an axes class that can have a visual break to indicate a discontinuous range.

### 25.2 DeCiDa

`DeCiDa` is a library of functions and classes for electron device characterization, electronic circuit design and general data visualization and analysis.

### 25.3 Matplotlib-Venn

`Matplotlib-Venn` provides a set of functions for plotting 2- and 3-set area-weighted (or un-weighted) Venn diagrams.

### 25.4 mpl-probscale

`mpl-probscale` is a small extension that allows Matplotlib users to specify probability scales.

Simply importing the `probscale` module registers the scale with Matplotlib, making it accessible via e.g., `ax.set_xscale('prob')` or `plt.yscale('prob')`.

## 25.5 `mpl-scatter-density`

`mpl-scatter-density` is a small package that makes it easy to make scatter plots of large numbers of points using a density map. The following example contains around 13 million points and the plotting (excluding reading in the data) took less than a second on an average laptop:

When used in interactive mode, the density map is downsampled on-the-fly while panning/zooming in order to provide a smooth interactive experience.

## 25.6 mplstereonet

`mplstereonet` provides stereonets for plotting and analyzing orientation data in Matplotlib.

## 25.7 Natgrid

`mpl_toolkits.natgrid` is an interface to the `natgrid` C library for gridding irregularly spaced data.

## 25.8 pyUpSet

`pyUpSet` is a static Python implementation of the `UpSet` suite by Lex et al. to explore complex intersections of sets and data frames.

## 25.9 seaborn

`seaborn` is a high level interface for drawing statistical graphics with Matplotlib. It aims to

make visualization a central part of exploring and understanding complex datasets.

## 25.10 WCSAxes

The [Astropy](https://www.astropy.org) core package includes a submodule called `WCSAxes` (available at [astropy.visualization.wcsaxes](https://astropy.visualization.wcsaxes)) which adds Matplotlib projections for Astronomical image data. The following is an example of a plot made with `WCSAxes` which includes the original coordinate system of the image and an overlay of a different coordinate system:

## 25.11 Windrose

`Windrose` is a Python Matplotlib, Numpy library to manage wind data, draw windroses (also known as polar rose plots), draw probability density functions and fit Weibull distributions.

## INTERACTIVITY

### 26.1 `mplcursors`

`mplcursors` provides interactive data cursors for Matplotlib.

### 26.2 `MplDataCursor`

`MplDataCursor` is a toolkit written by Joe Kington to provide interactive “data cursors” (clickable annotation boxes) for Matplotlib.

## MISCELLANEOUS

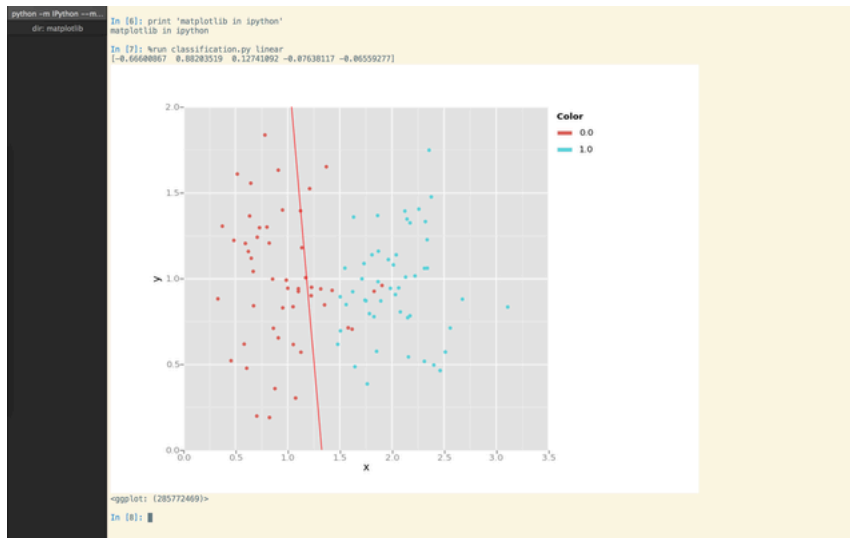

### 27.1 `adjustText`

`adjustText` is a small library for automatically adjusting text position in Matplotlib plots to minimize overlaps between them, specified points and other objects.

## 27.2 iTerm2 terminal backend

`matplotlib_itterm2` is an external Matplotlib backend using the iTerm2 nightly build inline image display feature.

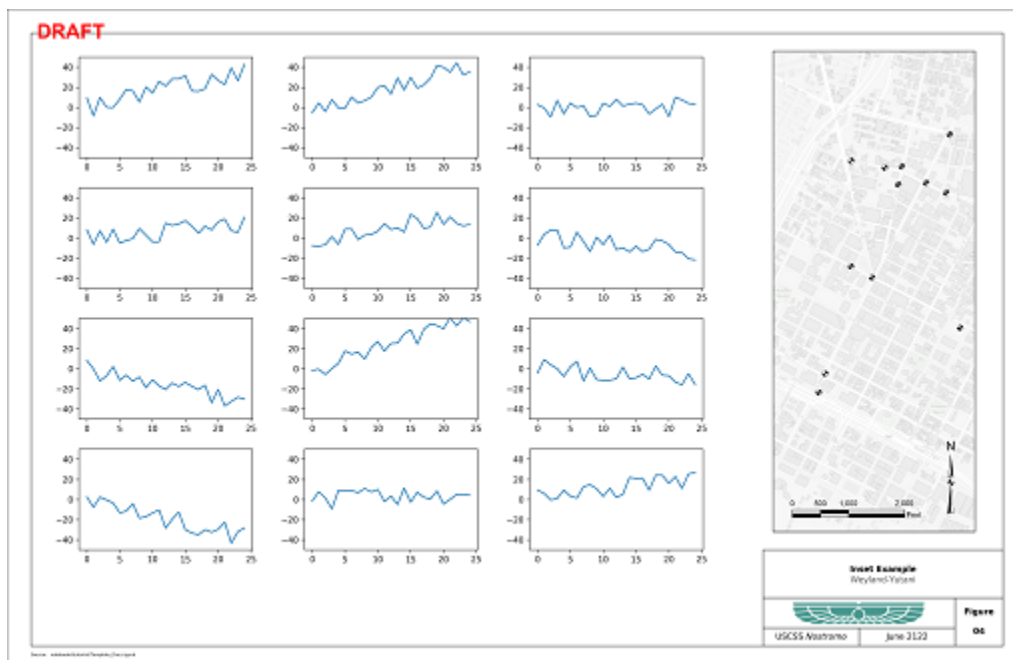

## 27.3 mplcairo

`mplcairo` is a cairo backend for Matplotlib, with faster and more accurate marker drawing, support for a wider selection of font formats and complex text layout, and various other features.

## 27.4 mpl-template

`mpl-template` provides a customizable way to add engineering figure elements such as a title block, border, and logo.

## **Part VI**

# **The Matplotlib Developers' Guide**

## CONTRIBUTING

This project is a community effort, and everyone is welcome to contribute.

The project is hosted on <https://github.com/matplotlib/matplotlib>

### 28.1 Submitting a bug report

If you find a bug in the code or documentation, do not hesitate to submit a ticket to the [Bug Tracker](#). You are also welcome to post feature requests or pull requests.

If you are reporting a bug, please do your best to include the following:

1. A short, top-level summary of the bug. In most cases, this should be 1-2 sentences.
2. A short, self-contained code snippet to reproduce the bug, ideally allowing a simple copy and paste to reproduce. Please do your best to reduce the code snippet to the minimum required.
3. The actual outcome of the code snippet.
4. The expected outcome of the code snippet.
5. The Matplotlib version, Python version and platform that you are using. You can grab the version with the following commands:

```
>>> import matplotlib
>>> matplotlib.__version__
'1.5.3'
>>> import platform
>>> platform.python_version()
'2.7.12'
```

We have preloaded the issue creation page with a Markdown template that you can use to organize this information.

Thank you for your help in keeping bug reports complete, targeted and descriptive.

### 28.2 Retrieving and installing the latest version of the code

When developing Matplotlib, sources must be downloaded, built, and installed into a local environment on your machine.

Follow the instructions detailed [here](#) to set up your environment to build Matplotlib from source.

**Warning:** When working on Matplotlib sources, having multiple versions installed by different methods into the same environment may not always work as expected.

To work on Matplotlib sources, it is strongly recommended to set up an alternative development environment, using the something like [virtual environments in python](#), or a [conda environment](#).

If you choose to use an already existing environment, and not a clean virtual or conda environment, uninstall the current version of Matplotlib in that environment using the same method used to install it.

If working on Matplotlib documentation only, the above steps are *not* absolutely necessary.

We use [Git](#) for version control and [GitHub](#) for hosting our main repository.

You can check out the latest sources with the command (see [Set up your fork](#) for more details):

```
git clone https://github.com/matplotlib/matplotlib.git
```

and navigate to the `matplotlib` directory. If you have the proper privileges, you can use `git@` instead of `https://`, which works through the ssh protocol and might be easier to use if you are using 2-factor authentication.

### 28.2.1 Building Matplotlib for image comparison tests

Matplotlib's test suite makes heavy use of image comparison tests, meaning the result of a plot is compared against a known good result. Unfortunately, different versions of FreeType produce differently formed characters, causing these image comparisons to fail. To make them reproducible, Matplotlib can be built with a special local copy of FreeType. This is recommended for all Matplotlib developers.

Copy `setup.cfg.template` to `setup.cfg` and edit it to contain:

```
[test]
local_freetype = True
tests = True
```

or set the `MPLLOCALFREETYPE` environmental variable to any true value.

### 28.2.2 Installing Matplotlib in developer mode

To install Matplotlib (and compile the c-extensions) run the following command from the top-level directory

```
python -mpip install -ve .
```

This installs Matplotlib in 'editable/develop mode', i.e., builds everything and places the correct link entries in the install directory so that python will be able to import Matplotlib from the source directory. Thus, any changes to the `*.py` files will be reflected the next time you import the library. If you change the C-extension source (which might happen if you change branches) you will need to run

```
python setup.py build
```

or re-run `python -mpip install -ve ..`

Alternatively, if you do

```
python -mpip install -v .
```

all of the files will be copied to the installation directory however, you will have to rerun this command every time the source is changed. Additionally you will need to copy `setup.cfg` template to `setup.cfg` and edit it to contain

```
[test]
local_freetype = True
tests = True
```

In either case you can then run the tests to check your work environment is set up properly:

```
pytest
```

---

**Note:** **Additional dependencies for testing:** [pytest](#) (version 3.4 or later), [Ghostscript](#), [Inkscape](#)

---

**See also:**

- [Developer's tips for testing](#)

## 28.3 Contributing code

### 28.3.1 How to contribute

The preferred way to contribute to Matplotlib is to fork the [main repository](#) on GitHub, then submit a "pull request" (PR).

The best practices for using GitHub to make PRs to Matplotlib are documented in the [Development workflow](#) section.

A brief overview is:

1. [Create an account](#) on GitHub if you do not already have one.
2. Fork the [project repository](#): click on the 'Fork' button near the top of the page. This creates a copy of the code under your account on the GitHub server.
3. Clone this copy to your local disk:

```
$ git clone https://github.com/YourLogin/matplotlib.git
```

4. Create a branch to hold your changes:

```
$ git checkout -b my-feature origin/master
```

and start making changes. Never work in the master branch!

5. Work on this copy, on your computer, using Git to do the version control. When you're done editing e.g., `lib/matplotlib/collections.py`, do:

```
$ git add lib/matplotlib/collections.py
$ git commit
```

to record your changes in Git, then push them to GitHub with:

```
$ git push -u origin my-feature
```

Finally, go to the web page of your fork of the Matplotlib repo, and click 'Pull request' to send your changes to the maintainers for review. You may want to consider sending an email to the mailing list for more visibility.

**See also:**

- [Git documentation](#)
- [Development workflow](#).
- [Working with Matplotlib source code](#)

### 28.3.2 Contributing pull requests

It is recommended to check that your contribution complies with the following rules before submitting a pull request:

- If your pull request addresses an issue, please use the title to describe the issue and mention the issue number in the pull request description to ensure that a link is created to the original issue.
- All public methods should have informative docstrings with sample usage when appropriate. Use the [numpy docstring standard](#).
- Formatting should follow the recommendations of [PEP8](#). You should consider installing/enabling automatic PEP8 checking in your editor. Part of the test suite is checking PEP8 compliance, things go smoother if the code is mostly PEP8 compliant to begin with.
- Each high-level plotting function should have a simple example in the `Example` section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go in the `examples` tree.
- Changes (both new features and bugfixes) should be tested. See [Developer's tips for testing](#) for more details.
- Import the following modules using the standard scipy conventions:

```
import numpy as np
import numpy.ma as ma
import matplotlib as mpl
import matplotlib.pyplot as plt
import matplotlib.cbook as cbook
import matplotlib.patches as mpatches
```

- If your change is a major new feature, add an entry to the `What's new` section by adding a new file in `doc/users/next_whats_new` (see `doc/users/next_whats_new/README.rst` for more information).

- If you change the API in a backward-incompatible way, please document it in `doc/api/api_changes`, by adding a new file describing your changes (see `doc/api/api_changes/README.rst` for more information)
- See below for additional points about *Keyword argument processing*, if applicable for your pull request.

In addition, you can check for common programming errors with the following tools:

- Code with a good unittest coverage (at least 70%, better 100%), check with:

```
python -mpip install coverage
pytest --cov=matplotlib --showlocals -v
```

- No pyflakes warnings, check with:

```
python -mpip install pyflakes
pyflakes path/to/module.py
```

---

**Note:** The current state of the Matplotlib code base is not compliant with all of those guidelines, but we expect that enforcing those constraints on all new contributions will move the overall code base quality in the right direction.

---

- [Writing documentation](#)

### 28.3.3 Issues for New Contributors

New contributors should look for the following tags when looking for issues. We strongly recommend that new contributors tackle issues labeled [good first issue](#) as they are easy, well documented issues, that do not require an understanding of the different submodules of Matplotlib. This helps the contributor become familiar with the contribution workflow, and for the core devs to become acquainted with the contributor; besides which, we frequently underestimate how easy an issue is to solve!

## 28.4 Other ways to contribute

Code is not the only way to contribute to Matplotlib. For instance, documentation is also a very important part of the project and often doesn't get as much attention as it deserves. If you find a typo in the documentation, or have made improvements, do not hesitate to send an email to the mailing list or submit a GitHub pull request. Full documentation can be found under the `doc/` directory.

It also helps us if you spread the word: reference the project from your blog and articles or link to it from your website!

## 28.5 Coding guidelines

### 28.5.1 New modules and files: installation

- If you have added new files or directories, or reorganized existing ones, make sure the new files are included in the match patterns in `MANIFEST.in`, and/or in `package_data` in `setup.py`.

### 28.5.2 C/C++ extensions

- Extensions may be written in C or C++.
- Code style should conform to PEP7 (understanding that PEP7 doesn't address C++, but most of its admonitions still apply).
- Python/C interface code should be kept separate from the core C/C++ code. The interface code should be named `FOO_wrap.cpp` or `FOO_wrapper.cpp`.
- Header file documentation (aka docstrings) should be in Numpydoc format. We don't plan on using automated tools for these docstrings, and the Numpydoc format is well understood in the scientific Python community.

### 28.5.3 Keyword argument processing

Matplotlib makes extensive use of `**kwargs` for pass-through customizations from one function to another. A typical example is in `matplotlib.pyplot.text()`. The definition of the pylab text function is a simple pass-through to `matplotlib.axes.Axes.text()`:

```
# in pylab.py
def text(*args, **kwargs):
    ret = gca().text(*args, **kwargs)
    draw_if_interactive()
    return ret
```

`text()` in simplified form looks like this, i.e., it just passes all args and kwargs on to `matplotlib.text.Text.__init__()`:

```
# in axes/_axes.py
def text(self, x, y, s, fontdict=None, withdash=False, **kwargs):
    t = Text(x=x, y=y, text=s, **kwargs)
```

and `__init__()` (again with liberties for illustration) just passes them on to the `matplotlib.artist.Artist.update()` method:

```
# in text.py
def __init__(self, x=0, y=0, text='', **kwargs):
    Artist.__init__(self)
    self.update(kwargs)
```

`update` does the work looking for methods named like `set_property` if `property` is a keyword argument. i.e., no one looks at the keywords, they just get passed through the API to the artist constructor which looks for suitably named methods and calls them with the value.

As a general rule, the use of `**kwargs` should be reserved for pass-through keyword arguments, as in the example above. If all the keyword args are to be used in the function, and not passed on, use the key/value keyword args in the function definition rather than the `**kwargs` idiom.

In some cases, you may want to consume some keys in the local function, and let others pass through. Instead of popping arguments to use off `**kwargs`, specify them as keyword-only arguments to the local function. This makes it obvious at a glance which arguments will be consumed in the function. For example, in `plot()`, `scalex` and `scaley` are local arguments and the rest are passed on as `Line2D()` keyword arguments:

```
# in axes/_axes.py
def plot(self, *args, scalex=True, scaley=True, **kwargs):
    lines = []
    for line in self._get_lines(*args, **kwargs):
        self.add_line(line)
        lines.append(line)
```

### 28.5.4 Using logging for debug messages

Matplotlib uses the standard python `logging` library to write verbose warnings, information, and debug messages. Please use it! In all those places you write `print()` statements to do your debugging, try using `log.debug()` instead!

To include `logging` in your module, at the top of the module, you need to import `logging`. Then calls in your code like:

```
_log = logging.getLogger(__name__) # right after the imports

# code
# more code
_log.info('Here is some information')
_log.debug('Here is some more detailed information')
```

will log to a logger named `matplotlib.yourmodulename`.

If an end-user of Matplotlib sets up `logging` to display at levels more verbose than `logger.WARNING` in their code as follows:

```
import logging
fmt = '%(name)s:%(lineno)5d - %(levelname)s - %(message)s'
logging.basicConfig(level=logging.DEBUG, format=fmt)
import matplotlib.pyplot as plt
```

Then they will receive messages like:

```
matplotlib.backends: 89 - INFO - backend MacOSX version unknown
matplotlib.yourmodulename: 347 - INFO - Here is some information
matplotlib.yourmodulename: 348 - DEBUG - Here is some more detailed information
```

#### Which logging level to use?

There are five levels at which you can emit messages. `logging.critical` and `logging.error` are really only there for errors that will end the use of the library but not kill the interpreter. `logging.warning` overlaps with the warnings library. The [logging tutorial](#) suggests that the

difference between `logging.warning` and `warnings.warn` is that `warnings.warn` be used for things the user must change to stop the warning, whereas `logging.warning` can be more persistent.

By default, `logging` displays all log messages at levels higher than `logging.WARNING` to `sys.stderr`.

Calls to `logging.info` are not displayed by default. They are for information that the user may want to know if the program behaves oddly. For instance, if an object isn't drawn because its position is `NaN`, that can usually be ignored, but a mystified user could set `logging.basicConfig(level=logging.INFO)` and get an error message that says why.

`logging.debug` is the least likely to be displayed, and hence can be the most verbose.

### 28.5.5 Developing a new backend

If you are working on a custom backend, the `backend` setting in `matplotlibrc` (*Customizing Matplotlib with style sheets and rcParams*) supports an external backend via the module directive. If `my_backend.py` is a Matplotlib backend in your `PYTHONPATH`, you can set it on one of several ways

- in `matplotlibrc`:

```
backend : module://my_backend
```

- with the `MPLBACKEND` environment variable:

```
> export MPLBACKEND="module://my_backend"
> python simple_plot.py
```

- with the `use` directive in your script:

```
import matplotlib
matplotlib.use('module://my_backend')
```

### 28.5.6 Writing examples

We have hundreds of examples in subdirectories of `matplotlib/examples`, and these are automatically generated when the website is built to show up in the `examples` section of the website.

Any sample data that the example uses should be kept small and distributed with Matplotlib in the `lib/matplotlib/mpl-data/sample_data/` directory. Then in your example code you can load it into a file handle with:

```
import matplotlib.cbook as cbook
fh = cbook.get_sample_data('mydata.dat')
```

## DEVELOPER'S TIPS FOR TESTING

Matplotlib's testing infrastructure depends on `pytest`. The tests are in `lib/matplotlib/tests`, and customizations to the `pytest` testing infrastructure are in `matplotlib.testing`.

### 29.1 Requirements

Install the latest version of Matplotlib as documented in *Retrieving and installing the latest version of the code*. In particular, follow the instructions to use a local FreeType build.

The following software is required to run the tests:

- `pytest` ( $\geq 3.4$ )
- Ghostscript (to render PDF files)
- Inkscape (to render SVG files)

Optionally you can install:

- `pytest-cov` ( $\geq 2.3.1$ ) to collect coverage information
- `pytest-pep8` to test coding standards
- `pytest-timeout` to limit runtime in case of stuck tests
- `pytest-xdist` to run tests in parallel

### 29.2 Running the tests

Running the tests is simple. Make sure you have `pytest` installed and run:

```
pytest
```

or:

```
pytest .
```

in the root directory of the distribution. The script takes a set of commands, such as:

<code>--pep8</code>	Perform pep8 checks (requires <code>pytest-pep8</code> )
<code>-m "not network"</code>	Disable tests that require network access

Additional arguments are passed on to pytest. See the pytest documentation for [supported arguments](#). Some of the more important ones are given here:

<code>--verbose</code>	Be more verbose
<code>--n NUM</code>	Run tests in parallel over NUM processes (requires <a href="#">pytest-xdist</a> )
<code>--timeout=SECONDS</code>	Set timeout for results from each test process (requires <a href="#">pytest-timeout</a> )
<code>--capture=no</code> or <code>-s</code>	Do not capture stdout

To run a single test from the command line, you can provide a file path, optionally followed by the function separated by two colons, e.g., (tests do not need to be installed, but Matplotlib should be):

```
pytest lib/matplotlib/tests/test_simplification.py::test_clipping
```

or, if tests are installed, a dot-separated path to the module, optionally followed by the function separated by two colons, such as:

```
pytest --pyargs matplotlib.tests.test_simplification::test_clipping
```

If you want to run the full test suite, but want to save wall time try running the tests in parallel:

```
pytest --verbose -n 5
```

Depending on your version of Python and `pytest-xdist`, you may need to set `PYTHONHASHSEED` to a fixed value when running in parallel:

```
PYTHONHASHSEED=0 pytest --verbose -n 5
```

An alternative implementation that does not look at command line arguments and works from within Python is to run the tests from the Matplotlib library function `matplotlib.test()`:

```
import matplotlib
matplotlib.test()
```

## 29.3 Writing a simple test

Many elements of Matplotlib can be tested using standard tests. For example, here is a test from `matplotlib.tests.test_basic`:

```
def test_simple():
    """
    very simple example test
    """
    assert 1 + 1 == 2
```

Pytest determines which functions are tests by searching for files whose names begin with "test\_" and then within those files for functions beginning with "test" or classes beginning with "Test".

Some tests have internal side effects that need to be cleaned up after their execution (such as created figures or modified rc params). The pytest fixture `mpl_test_settings()` will automatically clean these up; there is no need to do anything further.

## 29.4 Random data in tests

Random data can be a very convenient way to generate data for examples, however the randomness is problematic for testing (as the tests must be deterministic!). To work around this set the seed in each test. For numpy use:

```
import numpy as np
np.random.seed(19680801)
```

and Python's random number generator:

```
import random
random.seed(19680801)
```

The seed is John Hunter's birthday.

## 29.5 Writing an image comparison test

Writing an image based test is only slightly more difficult than a simple test. The main consideration is that you must specify the "baseline", or expected, images in the `image_comparison()` decorator. For example, this test generates a single image and automatically tests it:

```
import numpy as np
import matplotlib
from matplotlib.testing.decorators import image_comparison
import matplotlib.pyplot as plt

@image_comparison(baseline_images=['spines_axes_positions'],
                 extensions=['png'])
def test_spines_axes_positions():
    # SF bug 2852168
    fig = plt.figure()
    x = np.linspace(0, 2*np.pi, 100)
    y = 2*np.sin(x)
    ax = fig.add_subplot(1,1,1)
    ax.set_title('centered spines')
    ax.plot(x,y)
    ax.spines['right'].set_position(('axes',0.1))
    ax.yaxis.set_ticks_position('right')
    ax.spines['top'].set_position(('axes',0.25))
    ax.xaxis.set_ticks_position('top')
    ax.spines['left'].set_color('none')
    ax.spines['bottom'].set_color('none')
```

The first time this test is run, there will be no baseline image to compare against, so the test will fail. Copy the output images (in this case `result_images/test_category/spines_axes_positions.png`) to the correct subdirectory of `baseline_images` tree in the source directory (in this case `lib/matplotlib/tests/baseline_images/test_category`). Put this new file under source code revision control (with `git add`). When rerunning the tests, they should now pass.

The `image_comparison()` decorator defaults to generating `png`, `pdf` and `svg` output, but in interest of keeping the size of the library from ballooning we should only include the `svg` or `pdf` outputs if the test is explicitly exercising a feature dependent on that backend.

There are two optional keyword arguments to the `image_comparison` decorator:

- `extensions`: If you only wish to test additional image formats (rather than just `png`), pass any additional file types in the list of the extensions to test. When copying the new baseline files be sure to only copy the output files, not their conversions to `png`. For example only copy the files ending in `pdf`, not in `_pdf.png`.
- `tol`: This is the image matching tolerance, the default `1e-3`. If some variation is expected in the image between runs, this value may be adjusted.

## 29.6 Known failing tests

If you're writing a test, you may mark it as a known failing test with the `pytest.mark.xfail()` decorator. This allows the test to be added to the test suite and run on the buildbots without causing undue alarm. For example, although the following test will fail, it is an expected failure:

```
import pytest

@pytest.mark.xfail
def test_simple_fail():
    '''very simple example test that should fail'''
    assert 1 + 1 == 3
```

Note that the first argument to the `xfail()` decorator is a fail condition, which can be a value such as `True`, `False`, or may be a dynamically evaluated expression. If a condition is supplied, then a reason must also be supplied with the `reason='message'` keyword argument.

## 29.7 Creating a new module in `matplotlib.tests`

We try to keep the tests categorized by the primary module they are testing. For example, the tests related to the `matplotlib.text` module are in `test_matplotlib_text.py`.

## 29.8 Using Travis CI

Travis CI is a hosted CI system "in the cloud".

Travis is configured to receive notifications of new commits to GitHub repos (via GitHub "service hooks") and to run builds or tests when it sees these new commits. It looks for a YAML file called `.travis.yml` in the root of the repository to see how to test the project.

Travis CI is already enabled for the [main matplotlib GitHub repository](#) - for example, see its [Travis page](#).

If you want to enable Travis CI for your personal Matplotlib GitHub repo, simply enable the repo to use Travis CI in either the Travis CI UI or the GitHub UI (Admin | Service Hooks). For details, see [the Travis CI Getting Started page](#). This generally isn't necessary, since any pull request submitted against the main Matplotlib repository will be tested.

Once this is configured, you can see the Travis CI results at [https://travis-ci.org/your\\_GitHub\\_user\\_name/matplotlib](https://travis-ci.org/your_GitHub_user_name/matplotlib) - here's an [example](#).

## 29.9 Using tox

**Tox** is a tool for running tests against multiple Python environments, including multiple versions of Python (e.g., 3.5, 3.6) and even different Python implementations altogether (e.g., CPython, PyPy, Jython, etc.)

Testing all versions of Python (3.5, 3.6, ...) requires having multiple versions of Python installed on your system and on the PATH. Depending on your operating system, you may want to use your package manager (such as apt-get, yum or MacPorts) to do this.

tox makes it easy to determine if your working copy introduced any regressions before submitting a pull request. Here's how to use it:

```
$ pip install tox
$ tox
```

You can also run tox on a subset of environments:

```
$ tox -e py36,py37
```

Tox processes everything serially so it can take a long time to test several environments. To speed it up, you might try using a new, parallelized version of tox called **detox**. Give this a try:

```
$ pip install -U -i http://pypi.testrun.org detox
$ detox
```

Tox is configured using a file called `tox.ini`. You may need to edit this file if you want to add new environments to test (e.g., `py33`) or if you want to tweak the dependencies or the way the tests are run. For more info on the `tox.ini` file, see the [Tox Configuration Specification](#).

## 30.1 Getting started

### 30.1.1 General file structure

All documentation is built from the `doc/` directory. This directory contains both reStructured-Text (ReST; `.rst`) files that contain pages in the documentation and configuration files for Sphinx.

The `.rst` files are kept in `doc/users`, `doc/devel`, `doc/api` and `doc/faq`. The main entry point is `doc/index.rst`, which pulls in the `index.rst` file for the users guide, developers guide, api reference, and FAQs. The documentation suite is built as a single document in order to make the most effective use of cross referencing.

Sphinx also creates `.rst` files that are staged in `doc/api` from the docstrings of the classes in the Matplotlib library. Except for `doc/api/api_changes/`, these `.rst` files are created when the documentation is built.

Similarly, the contents of `doc/gallery` and `doc/tutorials` are generated by the [Sphinx Gallery](#) from the sources in `examples` and `tutorials`. These sources consist of python scripts that have ReST documentation built into their comments. Don't directly edit the `.rst` files in `doc/gallery` and `doc/tutorials` as they are regenerated when the documentation are built.

### 30.1.2 Installing dependencies

The documentation for Matplotlib is generated from reStructuredText (ReST) using the [Sphinx](#) documentation generation tool. There are several extra requirements that are needed to build the documentation. They are listed in `doc-requirements.txt` and listed below:

- `Sphinx>=1.3, !=1.5.0, !=1.6.4, !=1.7.3`
- `colorspacious`
- `IPython`
- `numpydoc>=0.4`
- `Pillow`
- `sphinx-gallery>=0.1.13`
- `graphviz`

---

**Note:**

- You'll need a minimal working LaTeX distribution for many examples to run.
- [Graphviz](#) is not a Python package, and needs to be installed separately.

### 30.1.3 Building the docs

The documentation sources are found in the `doc/` directory in the trunk. The configuration file for Sphinx is `doc/conf.py`. It controls which directories Sphinx parses, how the docs are built, and how the extensions are used. To build the documentation in html format, `cd` into `doc/` and run:

```
make html
```

Other useful invocations include

```
# Delete built files. May help if you get errors about missing paths or
# broken links.
make clean

# Build pdf docs.
make latexpdf
```

The `SPHINXOPTS` variable is set to `-w` by default to turn warnings into errors. To unset it, use

```
make SPHINXOPTS= html
```

You can use the `O` variable to set additional options:

- `make O=-j4 html` runs a parallel build with 4 processes.
- `make O=-Dplot_formats=png:100 html` saves figures in low resolution.
- `make O=-Dplot_gallery=0 html` skips the gallery build.

Multiple options can be combined using e.g. `make O='-j4 -Dplot_gallery=0' html`.

On Windows, options needs to be set as environment variables, e.g. `set O=-W -j4 & make html`.

## 30.2 Writing ReST pages

Most documentation is either in the docstring of individual classes and methods, in explicit `.rst` files, or in examples and tutorials. All of these use the [ReST](#) syntax. Users should look at the [ReST](#) documentation for a full description. But some specific hints and conventions Matplotlib uses are useful for creating documentation.

### 30.2.1 Formatting and style conventions

It is useful to strive for consistency in the Matplotlib documentation. Here are some formatting and style conventions that are used.

### Section name formatting

For everything but top-level chapters, use Upper lower for section titles, e.g., Possible hangups rather than Possible Hangups

### Function arguments

Function arguments and keywords within docstrings should be referred to using the *\*emphasis\** role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
Here is a description of *argument*
```

Do not use the ``default`` role:

```
Do not describe `argument` like this. As per the next section, this syntax will (unsuccessfully) attempt to resolve the argument as a link to a class or method in the library.
```

nor the ```literal``` role:

```
Do not describe ``argument`` like this.
```

## 30.2.2 Referring to other documents and sections

Sphinx allows internal references between documents.

Documents can be linked with the `:doc:` directive:

```
See the :doc:`/faq/installing_faq`  
See the tutorial :doc:`/tutorials/introductory/sample_plots`  
See the example :doc:`/gallery/lines_bars_and_markers/simple_plot`
```

will render as:

See the *Installation*

See the tutorial *Sample plots in Matplotlib*

See the example `/gallery/lines_bars_and_markers/simple_plot`

Sections can also be given reference names. For instance from the *Installation* link:

```
.. _clean-install:  
  
How to completely remove Matplotlib  
=====  
  
Occasionally, problems with Matplotlib can be solved with a clean...
```

and refer to it using the standard reference syntax:

```
See :ref:`clean-install`
```

will give the following link: [How to completely remove Matplotlib](#)

To maximize internal consistency in section labeling and references, use hyphen separated, descriptive labels for section references. Keep in mind that contents may be reorganized later, so avoid top level names in references like `user` or `devel` or `faq` unless necessary, because for example the FAQ "what is a backend?" could later become part of the users guide, so the label:

```
.. _what-is-a-backend:
```

is better than:

```
.. _faq-backend:
```

In addition, since underscores are widely used by Sphinx itself, use hyphens to separate words.

### 30.2.3 Referring to other code

To link to other methods, classes, or modules in Matplotlib you can use back ticks, for example:

```
`matplotlib.collections.LineCollection`
```

generates a link like this: [matplotlib.collections.LineCollection](#).

*Note:* We use the sphinx setting `default_role = 'obj'` so that you don't have to use qualifiers like `:class:`, `:func:`, `:meth:` and the likes.

Often, you don't want to show the full package and module name. As long as the target is unambiguous you can simply leave them out:

```
`LineCollection`
```

and the link still works: [LineCollection](#).

If there are multiple code elements with the same name (e.g. `plot()` is a method in multiple classes), you'll have to extend the definition:

```
`matplotlib.pyplot.plot` or `matplotlib.axes.Axes.plot`
```

These will show up as [matplotlib.pyplot.plot](#) or [matplotlib.axes.Axes.plot](#). To still show only the last segment you can add a tilde as prefix:

```
`~matplotlib.pyplot.plot` or `~matplotlib.axes.Axes.plot`
```

will render as [plot](#) or [plot](#).

Other packages can also be linked via [intersphinx](#):

```
`numpy.mean`
```

will return this link: [numpy.mean](#). This works for Python, Numpy, Scipy, and Pandas (full list is in `doc/conf.py`). Sometimes it is tricky to get external Sphinx linking to work; to check that a something exists to link to the following shell command outputs a list of all objects that can be referenced (in this case for Numpy):

```
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/numpy/objects.inv'
```

### 30.2.4 Including figures and files

Image files can directly included in pages with the `image::` directive. e.g., `users/navigation_toolbar.rst` displays the toolbar icons with a call to a static image:

```
.. image:: ../_static/toolbar.png
```

as rendered on the page: *Interactive navigation*.

Files can be included verbatim. For instance the `matplotlibrc` file is important for customizing Matplotlib, and is included verbatim in the tutorial in *Customizing Matplotlib with style sheets and rcParams*:

```
.. literalinclude:: ../../_static/matplotlibrc
```

This is rendered at the bottom of *Customizing Matplotlib with style sheets and rcParams*. Note that this is in a tutorial; see *Writing examples and tutorials* below.

The examples directory is also copied to `doc/gallery` by sphinx-gallery, so plots from the examples directory can be included using

```
.. plot:: gallery/lines_bars_and_markers/simple_plot.py
```

Note that the python script that generates the plot is referred to, rather than any plot that is created. Sphinx-gallery will provide the correct reference when the documentation is built.

## 30.3 Writing docstrings

Most of the API documentation is written in docstrings. These are comment blocks in source code that explain how the code works.

---

**Note:** Some parts of the documentation do not yet conform to the current documentation style. If in doubt, follow the rules given here and not what you may see in the source code. Pull requests updating docstrings to the current style are very welcome.

---

All new or edited docstrings should conform to the [numpydoc docstring guide](#). Much of the ReST syntax discussed above (*Writing ReST pages*) can be used for links and references. These docstrings eventually populate the `doc/api` directory and form the reference documentation for the library.

### 30.3.1 Example docstring

An example docstring looks like:

```

def hlines(self, y, xmin, xmax, colors='k', linestyle='solid',
           label='', **kwargs):
    """
    Plot horizontal lines at each y from xmin to xmax.

    Parameters
    -----
    y : float or array-like
        y-indexes where to plot the lines.

    xmin, xmax : float or array-like
        Respective beginning and end of each line. If scalars are
        provided, all lines will have the same length.

    colors : array-like of colors, optional, default: 'k'

    linestyle : {'solid', 'dashed', 'dashdot', 'dotted'}, optional

    label : string, optional, default: ''

    Returns
    -----
    lines : ~matplotlib.collections.LineCollection`

    Other Parameters
    -----
    **kwargs : ~matplotlib.collections.LineCollection` properties.

    See also
    -----
    vlines : vertical lines
    axhline: horizontal line across the axes
    """

```

See the `hlines` documentation for how this renders.

The [Sphinx](#) website also contains plenty of [documentation](#) concerning ReST markup and working with Sphinx in general.

### 30.3.2 Formatting conventions

The basic docstring conventions are covered in the [numpydoc docstring guide](#) and the [Sphinx](#) documentation. Some Matplotlib-specific formatting conventions to keep in mind:

#### Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
If linestyle is None, the 'solid' is used.
```

Do not use the ``default`` role or the ```literal``` role:

```
Neither `argument` nor ``argument`` should be used.
```

### Quotes for strings

Matplotlib does not have a convention whether to use single-quotes or double-quotes. There is a mixture of both in the current code.

Use simple single or double quotes when giving string values, e.g.:: rst

```
If 'tight', try to figure out the tight bbox of the figure.
```

### Parameter type descriptions

The main goal for parameter type descriptions is to be readable and understandable by humans. If the possible types are too complex use a simplification for the type description and explain the type more precisely in the text.

Generally, the [numpydoc docstring guide](#) conventions apply. The following rules expand on them where the numpydoc conventions are not specific.

Use `float` for a type that can be any number.

Use `array-like` for homogeneous numeric sequences, which could typically be a `numpy.array`. Dimensionality may be specified using `2D`, `3D`, `n-dimensional`. If you need to have variables denoting the sizes of the dimensions, use capital letters in brackets (`array-like (M, N)`). When referring to them in the text they are easier read and no special formatting is needed.

`float` is the implicit default dtype for array-likes. For other dtypes use `array-like of int`.

Some possible uses:

```
2D array-like
array-like (N)
array-like (M, N)
array-like (M, N, 3)
array-like of int
```

Non-numeric homogeneous sequences are described as lists, e.g.:

```
list of str
list of `.Artist`
```

### Referencing types

Generally, the rules from [referring-to-other-code](#) apply. More specifically:

Use full references `~matplotlib.colors.Normalize`` with an abbreviation tilde in parameter types. While the full name helps the reader of plain text docstrings, the HTML does not need to show the full name as it links to it. Hence, the `--shortening` keeps it more readable.

Use abbreviated links ``.Normalize`` in the text.

```
norm : ~matplotlib.colors.Normalize`, optional
    A `.Normalize` instance is used to scale luminance data to 0, 1.
```

See also sections

Sphinx automatically links code elements in the definition blocks of See also sections. No need to use backticks there:

```
See also
-----
vlines : vertical lines
axhline: horizontal line across the axes
```

### Wrapping parameter lists

Long parameter lists should be wrapped using a \ for continuation and starting on the new line without any indent:

```
def add_axes(self, *args, **kwargs):
    """
    ...

    Parameters
    -----
    projection :
        {'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', \
'rectilinear'}, optional
        The projection type of the axes.

    ...
    """
```

Alternatively, you can describe the valid parameter values in a dedicated section of the docstring.

### rcParams

rcParams can be referenced with the custom :rc: role: `:rc:`foo`` yields `rcParams["foo"]`. Use `= [default-val]` to indicate the default value of the parameter. The default value should be literal, i.e. enclosed in double backticks. For simplicity these may be omitted for string default values.

```
If not provided, defaults to :rc:`figure.(figsize` = `[6.4, 4.8]`.
If not provided, defaults to :rc:`figure.facecolor` = 'w'.
```

### 30.3.3 Deprecated formatting conventions

Formerly, we have used square brackets for explicit parameter lists `['solid' | 'dashed' | 'dotted']`. With numpydoc we have switched to their standard using curly braces `{'solid', 'dashed', 'dotted'}`.

### 30.3.4 Setters and getters

Artist properties are implemented using setter and getter methods (because Matplotlib predates the introductions of the `property` decorator in Python). By convention, these setters and getters are named `set_PROPERTYNAME` and `get_PROPERTYNAME`; the list of properties thusly defined on an artist and their values can be listed by the `setp` and `getp` functions.

---

**Note:** ACCEPTS blocks have recently become optional. You may now use a `numpydoc Parameters` block because the accepted values can now be read from the type description of the first parameter.

---

Property setter methods should indicate the values they accept using a (legacy) special block in the docstring, starting with `ACCEPTS`, as follows:

```
# in lines.py
def set_linestyle(self, linestyle):
    """
    Set the linestyle of the line

    ACCEPTS: [ '-' | '--' | '-.' | ':' | 'steps' | 'None' | '' | '' ]
    """
```

The `ACCEPTS` block is used to render a table of all properties and their acceptable values in the docs; it can also be displayed using, e.g., `plt.setp(Line2D)` (all properties) or `plt.setp(Line2D, 'linestyle')` (just one property).

There are cases in which the `ACCEPTS` string is not useful in the generated Sphinx documentation, e.g. if the valid parameters are already defined in the `numpydoc` parameter list. You can hide the `ACCEPTS` string from Sphinx by making it a ReST comment (i.e. use `.. ACCEPTS:`):

```
def set_linestyle(self, linestyle):
    """
    An ACCEPTS string invisible to Sphinx.

    .. ACCEPTS: [ '-' | '--' | '-.' | ':' | 'steps' | 'None' | '' | '' ]
    """
```

### 30.3.5 Keyword arguments

---

**Note:** The information in this section is being actively discussed by the development team, so use the docstring interpolation only if necessary. This section has been left in place for now because this interpolation is part of the existing documentation.

---

Since Matplotlib uses a lot of pass-through `kwargs`, e.g., in every function that creates a line (`plot`, `semilogx`, `semilogy`, etc...), it can be difficult for the new user to know which `kwargs` are supported. Matplotlib uses a docstring interpolation scheme to support documentation of every function that takes a `**kwargs`. The requirements are:

1. single point of configuration so changes to the properties don't require multiple docstring edits.

2. as automated as possible so that as properties change, the docs are updated automatically.

The function `matplotlib.artist.kwdoc` and the decorator `matplotlib.docstring.dedent_interpd` facilitate this. They combine Python string interpolation in the docstring with the Matplotlib artist introspection facility that underlies `setp` and `getp`. The `kwdoc` function gives the list of properties as a docstring. In order to use this in another docstring, first update the `matplotlib.docstring.interpd` object, as seen in this example from `matplotlib.lines`:

```
# in lines.py
docstring.interpd.update(Line2D=artist.kwdoc(Line2D))
```

Then in any function accepting `Line2D` pass-through kwargs, e.g., `matplotlib.axes.Axes.plot`:

```
# in axes.py
@docstring.dedent_interpd
def plot(self, *args, **kwargs):
    """
    Some stuff omitted

    The kwargs are Line2D properties:
    %(Line2D)s

    kwargs scalex and scaley, if defined, are passed on
    to autoscale_view to determine whether the x and y axes are
    autoscaled; default True. See Axes.autoscale_view for more
    information
    """
```

Note there is a problem for `Artist __init__` methods, e.g., `matplotlib.patches.Patch.__init__`, which supports `Patch` kwargs, since the artist inspector cannot work until the class is fully defined and we can't modify the `Patch.__init__.__doc__` docstring outside the class definition. There are some manual hacks in this case, violating the "single entry point" requirement above - see the `docstring.interpd.update` calls in `matplotlib.patches`.

### 30.3.6 Adding figures

As above (see *Including figures and files*), figures in the examples gallery can be referenced with a `:plot:` directive pointing to the python script that created the figure. For instance the `legend` docstring references the file `examples/text_labels_and_annotations/legend.py`:

```
"""
...

Examples
-----

.. plot:: gallery/text_labels_and_annotations/legend.py
"""
```

Note that `examples/text_labels_and_annotations/legend.py` has been mapped to `gallery/text_labels_and_annotations/legend.py`, a redirection that may be fixed in future re-organization of the docs.

Plots can also be directly placed inside docstrings. Details are in *Plot directive documentation*. A short example is:

```

"""
...

Examples
-----

.. plot::
    import matplotlib.image as mpimg
    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
"""

```

An advantage of this style over referencing an example script is that the code will also appear in interactive docstrings.

## 30.4 Writing examples and tutorials

Examples and tutorials are python scripts that are run by [Sphinx Gallery](#) to create a gallery of images in the `/doc/gallery` and `/doc/tutorials` directories respectively. To exclude an example from having an plot generated insert "sgskip" somewhere in the filename.

The format of these files is relatively straightforward. Properly formatted comment blocks are treated as [ReST](#) text, the code is displayed, and figures are put into the built page.

For instance the example `/gallery/lines_bars_and_markers/simple_plot` example is generated from `/examples/lines_bars_and_markers/simple_plot.py`, which looks like:

```

"""
=====
Simple Plot
=====

Create a simple plot.
"""
import matplotlib.pyplot as plt
import numpy as np

# Data for plotting
t = np.arange(0.0, 2.0, 0.01)
s = 1 + np.sin(2 * np.pi * t)

# Note that using plt.subplots below is equivalent to using
# fig = plt.figure and then ax = fig.add_subplot(111)
fig, ax = plt.subplots()
ax.plot(t, s)

ax.set(xlabel='time (s)', ylabel='voltage (mV)',
        title='About as simple as it gets, folks')
ax.grid()
plt.show()

```

The first comment block is treated as [ReST](#) text. The other comment blocks render as comments in `/gallery/lines_bars_and_markers/simple_plot`.

Tutorials are made with the exact same mechanism, except they are longer, and typically have more than one comment block (i.e. [Usage Guide](#)). The first comment block can be the

same as the example above. Subsequent blocks of ReST text are delimited by a line of `###` characters:

```

"""
=====
Simple Plot
=====

Create a simple plot.
"""
...
ax.grid()
plt.show()

#####
# Second plot
# =====
#
# This is a second plot that is very nice

fig, ax = plt.subplots()
ax.plot(np.sin(range(50)))

```

In this way text, code, and figures are output in a “notebook” style.

### 30.4.1 Order of examples in the gallery

The order of the sections of the *Tutorials* and the gallery, as well as the order of the examples within each section are determined in a two step process from within the `/doc/sphinxext/gallery_order.py`:

- *Explicit order*: This file contains a list of folders for the section order and a list of examples for the subsection order. The order of the items shown in the doc pages is the order those items appear in those lists.
- *Implicit order*: If a folder or example is not in those lists, it will be appended after the explicitly ordered items and all of those additional items will be ordered by pathname (for the sections) or by filename (for the subsections).

As a consequence, if you want to let your example appear in a certain position in the gallery, extend those lists with your example. In case no explicit order is desired or necessary, still make sure to name your example consistently, i.e. use the main function or subject of the example as first word in the filename; e.g. an image example should ideally be named similar to `imshow_mynewexample.py`.

## 30.5 Miscellaneous

### 30.5.1 Adding animations

There is a Matplotlib Google/Gmail account with username `mplgithub` which was used to setup the github account but can be used for other purposes, like hosting Google docs or Youtube videos. You can embed a Matplotlib animation in the docs by first saving the animation as a movie using `matplotlib.animation.Animation.save()`, and then uploading to [matplotlib's Youtube channel](#) and inserting the embedding string youtube provides like:

```
.. raw:: html

<iframe width="420" height="315"
  src="http://www.youtube.com/embed/32cjc6V00ZY"
  frameborder="0" allowfullscreen>
</iframe>
```

An example save command to generate a movie looks like this

```
ani = animation.FuncAnimation(fig, animate, np.arange(1, len(y)),
  interval=25, blit=True, init_func=init)

ani.save('double_pendulum.mp4', fps=15)
```

Contact Michael Droettboom for the login password to upload youtube videos of google docs to the mplgithub account.

### 30.5.2 Generating inheritance diagrams

Class inheritance diagrams can be generated with the `inheritance-diagram` directive. To use it, provide the directive with a number of class or module names (separated by whitespace). If a module name is provided, all classes in that module will be used. All of the ancestors of these classes will be included in the inheritance diagram.

A single option is available: `parts` controls how many of parts in the path to the class are shown. For example, if `parts == 1`, the class `matplotlib.patches.Patch` is shown as `Patch`. If `parts == 2`, it is shown as `patches.Patch`. If `parts == 0`, the full path is shown.

Example:

```
.. inheritance-diagram:: matplotlib.patches matplotlib.lines matplotlib.text
  :parts: 2
```

### 30.5.3 Emacs helpers

There is an emacs mode `rst.el` which automates many important ReST tasks like building and updating table-of-contents, and promoting or demoting section headings. Here is the basic `.emacs` configuration:

```
(require 'rst)
(setq auto-mode-alist
      (append '(("\\.txt$" . rst-mode)
                ("\\.rst$" . rst-mode)
                ("\\.rest$" . rst-mode)) auto-mode-alist))
```

Some helpful functions:

```
C-c TAB - rst-toc-insert
```

Insert table of contents at point

```
C-c C-u - rst-toc-update
```

(continues on next page)

(continued from previous page)

Update the table of contents at point

C-c C-l rst-shift-region-left

Shift region to the left

C-c C-r rst-shift-region-right

Shift region to the right

## PLOT DIRECTIVE DOCUMENTATION

A directive for including a matplotlib plot in a Sphinx document.

By default, in HTML output, `plot` will include a `.png` file with a link to a high-res `.png` and `.pdf`. In LaTeX output, it will include a `.pdf`.

The source code for the plot may be included in one of three ways:

1. **A path to a source file** as the argument to the directive:

```
.. plot:: path/to/plot.py
```

When a path to a source file is given, the content of the directive may optionally contain a caption for the plot:

```
.. plot:: path/to/plot.py
    This is the caption for the plot
```

Additionally, one may specify the name of a function to call (with no arguments) immediately after importing the module:

```
.. plot:: path/to/plot.py plot_function1
```

2. Included as **inline content** to the directive:

```
.. plot::
    import matplotlib.pyplot as plt
    import matplotlib.image as mpimg
    import numpy as np
    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
```

3. Using **doctest** syntax:

```
.. plot::
    A plotting example:
    >>> import matplotlib.pyplot as plt
    >>> plt.plot([1,2,3], [4,5,6])
```

### 31.1 Options

The `plot` directive supports the following options:

- format** [`{'python', 'doctest'}`] Specify the format of the input
- include-source** [bool] Whether to display the source code. The default can be changed using the `plot_include_source` variable in `conf.py`
- encoding** [str] If this source file is in a non-UTF8 or non-ASCII encoding, the encoding must be specified using the `:encoding:` option. The encoding will not be inferred using the `-*- coding -*-` metacomment.
- context** [bool or str] If provided, the code will be run in the context of all previous plot directives for which the `:context:` option was specified. This only applies to inline code plot directives, not those run from files. If the `:context: reset` option is specified, the context is reset for this and future plots, and previous figures are closed prior to running the code. `:context:close-figs` keeps the context but closes previous figures before running the code.
- nofigs** [bool] If specified, the code block will be run, but no figures will be inserted. This is usually useful with the `:context:` option.

Additionally, this directive supports all of the options of the `image` directive, except for `target` (since `plot` will add its own target). These include `alt`, `height`, `width`, `scale`, `align` and `class`.

## 31.2 Configuration options

The `plot` directive has the following configuration options:

- plot\_include\_source** Default value for the include-source option
- plot\_html\_show\_source\_link** Whether to show a link to the source in HTML.
- plot\_pre\_code** Code that should be executed before each plot. If not specified or None it will default to a string containing:

```
import numpy as np
from matplotlib import pyplot as plt
```

- plot\_basedir** Base directory, to which `plot::` file names are relative to. (If None or empty, file names are relative to the directory where the file containing the directive is.)

- plot\_formats** File formats to generate. List of tuples or strings:

```
[(suffix, dpi), suffix, ...]
```

that determine the file format and the DPI. For entries whose DPI was omitted, sensible defaults are chosen. When passing from the command line through `sphinx_build` the list should be passed as `suffix:dpi,suffix:dpi, ...`.

- plot\_html\_show\_formats** Whether to show links to the files in HTML.
- plot\_rcparams** A dictionary containing any non-standard rcParams that should be applied before each plot.
- plot\_apply\_rcparams** By default, rcParams are applied when `context` option is not used in a plot directive. This configuration option overrides this behavior and applies rcParams before each plot.
- plot\_working\_directory** By default, the working directory will be changed to the directory of the example, so the code can get at its data files, if any. Also

its path will be added to `sys.path` so it can import any helper modules sitting beside it. This configuration option can be used to specify a central directory (also added to `sys.path`) where data files and helper modules for all code are located.

**plot\_template** Provide a customized template for preparing restructured text.

`exception matplotlib.sphinxext.plot_directive.PlotError`

`matplotlib.sphinxext.plot_directive.mark_plot_labels(app, document)`

To make plots referenceable, we need to move the reference from the "htmlonly" (or "latexonly") node to the actual figure node itself.

`matplotlib.sphinxext.plot_directive.out_of_date(original, derived)`

Returns True if derivative is out-of-date wrt original, both of which are full file paths.

`matplotlib.sphinxext.plot_directive.plot_directive(name, arguments, options, content, lineno, content_offset, block_text, state, state_machine)`

Implementation of the `.. plot::` directive.

See the module docstring for details.

`matplotlib.sphinxext.plot_directive.remove_coding(text)`

Remove the coding comment, which `six.exec_` doesn't like.

`matplotlib.sphinxext.plot_directive.render_figures(code, code_path, output_dir, output_base, context, function_name, config, context_reset=False, close_figs=False)`

Run a pyplot script and save the images in `output_dir`.

Save the images under `output_dir` with file names derived from `output_base`

`matplotlib.sphinxext.plot_directive.run_code(code, code_path, ns=None, function_name=None)`

Import a Python module from a path, and run the function given by name, if `function_name` is not None.

`matplotlib.sphinxext.plot_directive.split_code_at_show(text)`

Split code at `plt.show()`

`matplotlib.sphinxext.plot_directive.unescape_doctest(text)`

Extract code from a piece of text, which contains either Python code or doctests.

## DEVELOPER'S GUIDE FOR CREATING SCALES AND TRANSFORMATIONS

Matplotlib supports the addition of custom procedures that transform the data before it is displayed.

There is an important distinction between two kinds of transformations. Separable transformations, working on a single dimension, are called "scales", and non-separable transformations, that handle data in two or more dimensions at a time, are called "projections".

From the user's perspective, the scale of a plot can be set with `set_xscale()` and `set_yscale()`. Projections can be chosen using the `projection` keyword argument to the `plot()` or `subplot()` functions, e.g.:

```
plot(x, y, projection="custom")
```

This document is intended for developers and advanced users who need to create new scales and projections for matplotlib. The necessary code for scales and projections can be included anywhere: directly within a plot script, in third-party code, or in the matplotlib source tree itself.

### 32.1 Creating a new scale

Adding a new scale consists of defining a subclass of `matplotlib.scale.ScaleBase`, that includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- A function to limit the range of the axis to acceptable values (`limit_range_for_scale()`). A log scale, for instance, would prevent the range from including values less than or equal to zero.
- Locators (major and minor) that determine where to place ticks in the plot, and optionally, how to adjust the limits of the plot to some "good" values. Unlike `limit_range_for_scale()`, which is always enforced, the range setting here is only used when automatically setting the range of the plot.
- Formatters (major and minor) that specify how the tick labels should be drawn.

Once the class is defined, it must be registered with matplotlib so that the user can select it.

A full-fledged and heavily annotated example is in `/gallery/scales/custom_scale`. There are also some classes in `matplotlib.scale` that may be used as starting points.

## 32.2 Creating a new projection

Adding a new projection consists of defining a projection axes which subclasses `matplotlib.axes.Axes` and includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- Transformations for the gridlines, ticks and ticklabels. Custom projections will often need to place these elements in special locations, and matplotlib has a facility to help with doing so.
- Setting up default values (overriding `cla()`), since the defaults for a rectilinear axes may not be appropriate.
- Defining the shape of the axes, for example, an elliptical axes, that will be used to draw the background of the plot and for clipping any data elements.
- Defining custom locators and formatters for the projection. For example, in a geographic projection, it may be more convenient to display the grid in degrees, even if the data is in radians.
- Set up interactive panning and zooming. This is left as an "advanced" feature left to the reader, but there is an example of this for polar plots in `matplotlib.projections.polar`.
- Any additional methods for additional convenience or features.

Once the projection axes is defined, it can be used in one of two ways:

- By defining the class attribute `name`, the projection axes can be registered with `matplotlib.projections.register_projection()` and subsequently simply invoked by name:

```
plt.axes(projection='my_proj_name')
```

- For more complex, parameterisable projections, a generic "projection" object may be defined which includes the method `_as_mpl_axes`. `_as_mpl_axes` should take no arguments and return the projection's axes subclass and a dictionary of additional arguments to pass to the subclass' `__init__` method. Subsequently a parameterised projection can be initialised with:

```
plt.axes(projection=MyProjection(param1=param1_value))
```

where `MyProjection` is an object which implements a `_as_mpl_axes` method.

A full-fledged and heavily annotated example is in `/gallery/misc/custom_projection`. The polar plot functionality in `matplotlib.projections.polar` may also be of interest.

## 32.3 API documentation

- `matplotlib.scale`

- *matplotlib.projections*
- *matplotlib.projections.polar*

## WORKING WITH *MATPLOTLIB* SOURCE CODE

Contents:

### 33.1 Introduction

These pages describe a [git](#) and [github](#) workflow for the [Matplotlib](#) project.

There are several different workflows here, for different ways of working with *Matplotlib*.

This is not a comprehensive git reference, it's just a workflow for our own project. It's tailored to the [github](#) hosting service. You may well find better or quicker ways of getting stuff done with git, but these should get you started.

For general resources for learning git, see [git resources](#).

### 33.2 Install git

#### 33.2.1 Overview

Debian / Ubuntu	<code>sudo apt-get install git</code>
Fedora	<code>sudo yum install git</code>
Windows	Download and install <a href="#">msysGit</a>
OS X	Use the <a href="#">git-osx-installer</a>

#### 33.2.2 In detail

See the [git](#) page for the most recent information.

Have a look at the [github](#) install help pages available from [github help](#)

There are good instructions here: <https://git-scm.com/book/en/v2/Getting-Started-Installing-Git>

## 33.3 Following the latest source

These are the instructions if you just want to follow the latest *Matplotlib* source, but you don't need to do any development for now.

The steps are:

- *Install git*
- get local copy of the [Matplotlib github](#) git repository
- update local copy from time to time

### 33.3.1 Get the local copy of the code

From the command line:

```
git clone git://github.com/matplotlib/matplotlib.git
```

You now have a copy of the code tree in the new `matplotlib` directory.

### 33.3.2 Updating the code

From time to time you may want to pull down the latest code. Do this with:

```
cd matplotlib
git pull
```

The tree in `matplotlib` will now have the latest changes from the initial repository.

## 33.4 Making a patch

You've discovered a bug or something else you want to change in [Matplotlib](#) .. — excellent!

You've worked out a way to fix it — even better!

You want to tell us about it — best of all!

The easiest way is to make a *patch* or set of patches. Here we explain how. Making a patch is the simplest and quickest, but if you're going to be doing anything more than simple quick things, please consider following the *Git for development* model instead.

### 33.4.1 Making patches

#### Overview

```
# tell git who you are
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
# get the repository if you don't have it
```

(continues on next page)

(continued from previous page)

```
git clone git://github.com/matplotlib/matplotlib.git
# make a branch for your patching
cd matplotlib
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
# hack hack, hack
git commit -am 'BF - added fix for Funny bug'
# make the patch files
git format-patch -M -C master
```

Then, send the generated patch files to the [Matplotlib mailing list](#) — where we will thank you warmly.

### In detail

1. Tell git who you are so it can label the commits you've made:

```
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
```

2. If you don't already have one, clone a copy of the [Matplotlib](#) repository:

```
git clone git://github.com/matplotlib/matplotlib.git
cd matplotlib
```

3. Make a 'feature branch'. This will be where you work on your bug fix. It's nice and safe and leaves you with access to an unmodified copy of the code in the main branch:

```
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
```

4. Do some edits, and commit them as you go:

```
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
# hack hack, hack
git commit -am 'BF - added fix for Funny bug'
```

Note the `-am` options to `commit`. The `m` flag just signals that you're going to type a message on the command line. The `a` flag — you can just take on faith — or see [why the -a flag?](#).

5. When you have finished, check you have committed all your changes:

```
git status
```

6. Finally, make your commits into patches. You want all the commits since you branched from the master branch:

```
git format-patch -M -C master
```

You will now have several files named for the commits:

```
0001-BF-added-tests-for-Funny-bug.patch
0002-BF-added-fix-for-Funny-bug.patch
```

Send these files to the [Matplotlib mailing list](#).

When you are done, to switch back to the main copy of the code, just return to the master branch:

```
git checkout master
```

### 33.4.2 Moving from patching to development

If you find you have done some patches, and you have one or more feature branches, you will probably want to switch to development mode. You can do this with the repository you have.

Fork the [Matplotlib repository on github](#) — *Making your own copy (fork) of Matplotlib*. Then:

```
# checkout and refresh master branch from main repo
git checkout master
git pull origin master
# rename pointer to main repository to 'upstream'
git remote rename origin upstream
# point your repo to default read / write to your fork on github
git remote add origin git@github.com:your-user-name/matplotlib.git
# push up any branches you've made and want to keep
git push origin the-fix-im-thinking-of
```

Then you can, if you want, follow the *Development workflow*.

## 33.5 Git for development

Contents:

### 33.5.1 Making your own copy (fork) of Matplotlib

You need to do this only once. The instructions here are very similar to the instructions at <https://help.github.com/forking/> — please see that page for more detail. We're repeating some of it here just to give the specifics for the [Matplotlib](#) project, and to suggest some default names.

#### Set up and configure a github account

If you don't have a github account, go to the [github page](#), and make one.

You then need to configure your account to allow write access — see the [Generating SSH keys help](#) on [github help](#).

### Create your own forked copy of Matplotlib

1. Log into your github account.
2. Go to the [Matplotlib github](#) home at [Matplotlib github](#).
3. Click on the *fork* button:

Now, after a short pause, you should find yourself at the home page for your own forked copy of [Matplotlib](#).

### 33.5.2 Set up your fork

First you follow the instructions for *Making your own copy (fork) of Matplotlib*.

#### Overview

```
git clone https://github.com/your-user-name/matplotlib.git
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

#### In detail

##### Clone your fork

1. Clone your fork to the local computer with `git clone https://github.com/your-user-name/matplotlib.git`
2. Investigate. Change directory to your new repo: `cd matplotlib`. Then `git branch -a` to show you all branches. You'll get something like:

```
* master
remotes/origin/master
```

This tells you that you are currently on the `master` branch, and that you also have a remote connection to `origin/master`. What remote repository is `remote/origin`? Try `git remote -v` to see the URLs for the remote. They will point to your github fork.

Now you want to connect to the upstream [Matplotlib github](#) repository, so you can merge in changes from trunk.

## Linking your repository to the upstream repo

```
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

upstream here is just the arbitrary name we're using to refer to the main [Matplotlib](#) repository at [Matplotlib github](#).

Note that we've used `git://` for the URL rather than `https://` or `git@`. The `git://` URL is read only. This means we that we can't accidentally (or deliberately) write to the upstream repo, and we are only going to use it to merge into our own code.

Just for your own satisfaction, show yourself that you now have a new 'remote', with `git remote -v show`, giving you something like:

```
upstream      git://github.com/matplotlib/matplotlib.git (fetch)
upstream      git://github.com/matplotlib/matplotlib.git (push)
origin        https://github.com/your-user-name/matplotlib.git (fetch)
origin        https://github.com/your-user-name/matplotlib.git (push)
```

## 33.5.3 Configure git

### Overview

Your personal git configurations are saved in the `.gitconfig` file in your home directory.

Here is an example `.gitconfig` file:

```
[user]
  name = Your Name
  email = you@yourdomain.example.com

[alias]
  ci = commit -a
  co = checkout
  st = status
  stat = status
  br = branch
  wdiff = diff --color-words

[core]
  editor = vim

[merge]
  summary = true
```

You can edit this file directly or you can use the `git config --global` command:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
```

(continues on next page)

(continued from previous page)

```
git config --global alias.wdiff "diff --color-words"
git config --global core.editor vim
git config --global merge.summary true
```

To set up on another computer, you can copy your `~/.gitconfig` file, or run the commands above.

## In detail

### user.name and user.email

It is good practice to tell `git` who you are, for labeling any changes you make to the code. The simplest way to do this is from the command line:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
```

This will write the settings into your git configuration file, which should now contain a user section with your name and email:

```
[user]
  name = Your Name
  email = you@yourdomain.example.com
```

Of course you'll need to replace `Your Name` and `you@yourdomain.example.com` with your actual name and email address.

### Aliases

You might well benefit from some aliases to common commands.

For example, you might well want to be able to shorten `git checkout` to `git co`. Or you may want to alias `git diff --color-words` (which gives a nicely formatted output of the diff) to `git wdiff`

The following `git config --global` commands:

```
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"
```

will create an alias section in your `.gitconfig` file with contents like this:

```
[alias]
  ci = commit -a
  co = checkout
  st = status -a
  stat = status -a
  br = branch
  wdiff = diff --color-words
```

### Editor

You may also want to make sure that your editor of choice is used

```
git config --global core.editor vim
```

### Merging

To enforce summaries when doing merges (~/.gitconfig file again):

```
[merge]
  log = true
```

Or from the command line:

```
git config --global merge.log true
```

### Fancy log output

This is a very nice alias to get a fancy log output; it should go in the alias section of your .gitconfig file:

```
lg = log --graph --pretty=format:'%Cred%h%Creset -%C(yellow)%d%Creset %s %Cgreen(%cr) %C(bold↵
↵blue)[%an]%Creset' --abbrev-commit --date=relative
```

You use the alias with:

```
git lg
```

and it gives graph / text output something like this (but with color!):

```
* 6d8e1ee - (HEAD, origin/my-fancy-feature, my-fancy-feature) NF - a fancy file (45 minutes ago)↵
↵[Matthew Brett]
* d304a73 - (origin/placeholder, placeholder) Merge pull request #48 from hhuuggoo/master (2↵
↵weeks ago) [Jonathan Terhorst]
|\
| * 4aff2a8 - fixed bug 35, and added a test in test_bugfixes (2 weeks ago) [Hugo]
|/
* a7ff2e5 - Added notes on discussion/proposal made during Data Array Summit. (2 weeks ago)↵
↵[Corran Webster]
* 68f6752 - Initial implimentation of AxisIndexer - uses 'index_by' which needs to be changed to a↵
↵call on an Axes object - this is all very sketchy right now. (2 weeks ago) [Corr
* 376adbd - Merge pull request #46 from terhorst/master (2 weeks ago) [Jonathan Terhorst]
|\
| * b605216 - updated joshu example to current api (3 weeks ago) [Jonathan Terhorst]
| * 2e991e8 - add testing for outer ufunc (3 weeks ago) [Jonathan Terhorst]
| * 7beda5a - prevent axis from throwing an exception if testing equality with non-axis object (3↵
↵weeks ago) [Jonathan Terhorst]
| * 65af65e - convert unit testing code to assertions (3 weeks ago) [Jonathan Terhorst]
| * 956fbab - Merge remote-tracking branch 'upstream/master' (3 weeks ago) [Jonathan Terhorst]
| |\
| |/
```

Thanks to Yury V. Zaytsev for posting it.

### 33.5.4 Development workflow

You already have your own forked copy of the [Matplotlib](#) repository, by following [Making your own copy \(fork\) of Matplotlib](#). You have [Set up your fork](#). You have configured git by following [Configure git](#). Now you are ready for some real work.

#### Workflow summary

In what follows we'll refer to the upstream Matplotlib master branch, as "trunk".

- Don't use your master branch for anything. Consider deleting it.
- When you are starting a new set of changes, fetch any changes from trunk, and start a new *feature branch* from that.
- Make a new branch for each separable set of changes — "one task, one branch" ([ipython git workflow](#)).
- Name your branch for the purpose of the changes - e.g. `bugfix-for-issue-14` or `refactor-database-code`.
- If you can possibly avoid it, avoid merging trunk or any other branches into your feature branch while you are working.
- If you do find yourself merging from trunk, consider [Rebasing on trunk](#)
- Ask on the [Matplotlib mailing list](#) if you get stuck.
- Ask for code review!

This way of working helps to keep work well organized, with readable history. This in turn makes it easier for project maintainers (that might be you) to see what you've done, and why you did it.

See [linux git workflow](#) and [ipython git workflow](#) for some explanation.

#### Consider deleting your master branch

It may sound strange, but deleting your own master branch can help reduce confusion about which branch you are on. See [deleting master on github](#) for details.

#### Update the mirror of trunk

First make sure you have done [Linking your repository to the upstream repo](#).

From time to time you should fetch the upstream (trunk) changes from github:

```
git fetch upstream
```

This will pull down any commits you don't have, and set the remote branches to point to the right commit. For example, 'trunk' is the branch referred to by (remote/branchname) `upstream/master` - and if there have been commits since you last checked, `upstream/master` will change after you do the fetch.

### Make a new feature branch

When you are ready to make some changes to the code, you should start a new branch. Branches that are for a collection of related edits are often called 'feature branches'.

Making an new branch for each set of related changes will make it easier for someone reviewing your branch to see what you are doing.

Choose an informative name for the branch to remind yourself and the rest of us what the changes in the branch are for. For example `add-ability-to-fly`, or `buxfix-for-issue-42`.

```
# Update the mirror of trunk
git fetch upstream
# Make new feature branch starting at current trunk
git branch my-new-feature upstream/master
git checkout my-new-feature
```

Generally, you will want to keep your feature branches on your public [github](#) fork of [Matplotlib](#). To do this, you [git push](#) this new branch up to your github repo. Generally (if you followed the instructions in these pages, and by default), git will have a link to your github repo, called `origin`. You push up to your own repo on github with:

```
git push origin my-new-feature
```

In git  $\geq$  1.7 you can ensure that the link is correctly set by using the `--set-upstream` option:

```
git push --set-upstream origin my-new-feature
```

From now on git will know that `my-new-feature` is related to the `my-new-feature` branch in the github repo.

### The editing workflow

#### Overview

```
# hack hack
git add my_new_file
git commit -am 'NF - some message'
git push
```

#### In more detail

1. Make some changes
2. See which files have changed with `git status` (see [git status](#)). You'll see a listing like this one:

```
# On branch ny-new-feature
# Changed but not updated:
#   (use "git add <file>..." to update what will be committed)
#   (use "git checkout -- <file>..." to discard changes in working directory)
#
# modified:   README
```

(continues on next page)

(continued from previous page)

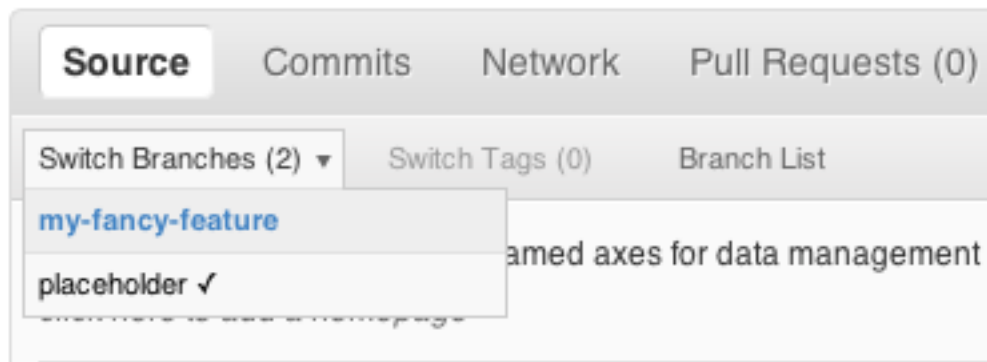

```
#
# Untracked files:
# (use "git add <file>..." to include in what will be committed)
#
# INSTALL
no changes added to commit (use "git add" and/or "git commit -a")
```

3. Check what the actual changes are with `git diff` ([git diff](#)).
4. Add any new files to version control `git add new_file_name` (see [git add](#)).
5. To commit all modified files into the local copy of your repo,, do `git commit -am 'A commit message'`. Note the `-am` options to `commit`. The `m` flag just signals that you're going to type a message on the command line. The `a` flag — you can just take on faith — or see [why the -a flag?](#) — and the helpful use-case description in the [tangled working copy problem](#). The [git commit](#) manual page might also be useful.
6. To push the changes up to your forked repo on github, do a `git push` (see [git push](#)).

### Ask for your changes to be reviewed or merged

When you are ready to ask for someone to review your code and consider a merge:

1. Go to the URL of your forked repo, say <https://github.com/your-user-name/matplotlib>.
2. Use the 'Switch Branches' dropdown menu near the top left of the page to select the branch with your changes:

3. Click on the 'Pull request' button:

Enter a title for the set of changes, and some explanation of what you've done. Say if there is anything you'd like particular attention for - like a complicated change or some code you are not happy with.

If you don't think your request is ready to be merged, just say so in your pull request message. This is still a good way of getting some preliminary code review.

### Some other things you might want to do

#### Delete a branch on github

```
git checkout master
# delete branch locally
git branch -D my-unwanted-branch
# delete branch on github
git push origin :my-unwanted-branch
```

Note the colon : before my-unwanted-branch. See also: <https://help.github.com/articles/pushing-to-a-remote/#deleting-a-remote-branch-or-tag>

#### Several people sharing a single repository

If you want to work on some stuff with other people, where you are all committing into the same repository, or even the same branch, then just share it via github.

First fork Matplotlib into your account, as from *Making your own copy (fork) of Matplotlib*.

Then, go to your forked repository github page, say <https://github.com/your-user-name/matplotlib>

Click on the 'Admin' button, and add anyone else to the repo as a collaborator:

Now all those people can do:

```
git clone https://github.com/your-user-name/matplotlib.git
```

Remember that links starting with https or git@ are read-write, and that git@ uses the ssh protocol; links starting with git:// are read-only.

Your collaborators can then commit directly into that repo with the usual:

```
git commit -am 'ENH - much better code'
git push origin master # pushes directly into your repo
```

#### Explore your repository

To see a graphical representation of the repository branches and commits:

```
gitk --all
```

To see a linear list of commits for this branch:

```
git log
```

You can also look at the [network graph visualizer](#) for your github repo.

Finally the *Fancy log output* `lg` alias will give you a reasonable text-based graph of the repository.

### Rebasing on trunk

Let's say you thought of some work you'd like to do. You *Update the mirror of trunk* and *Make a new feature branch* called `cool-feature`. At this stage trunk is at some commit, let's call it E. Now you make some new commits on your `cool-feature` branch, let's call them A, B, C. Maybe your changes take a while, or you come back to them after a while. In the meantime, trunk has progressed from commit E to commit (say) G:

```

      A---B---C cool-feature
      /
D---E---F---G trunk

```

At this stage you consider merging trunk into your feature branch, and you remember that this here page sternly advises you not to do that, because the history will get messy. Most of the time you can just ask for a review, and not worry that trunk has got a little ahead. But sometimes, the changes in trunk might affect your changes, and you need to harmonize them. In this situation you may prefer to do a rebase.

rebase takes your changes (A, B, C) and replays them as if they had been made to the current state of trunk. In other words, in this case, it takes the changes represented by A, B, C and replays them on top of G. After the rebase, your history will look like this:

```

      A'--B'--C' cool-feature
      /
D---E---F---G trunk

```

See [rebase without tears](#) for more detail.

To do a rebase on trunk:

```

# Update the mirror of trunk
git fetch upstream
# go to the feature branch
git checkout cool-feature
# make a backup in case you mess up
git branch tmp cool-feature
# rebase cool-feature onto trunk
git rebase --onto upstream/master upstream/master cool-feature

```

In this situation, where you are already on branch `cool-feature`, the last command can be written more succinctly as:

```
git rebase upstream/master
```

When all looks good you can delete your backup branch:

```
git branch -D tmp
```

If it doesn't look good you may need to have a look at [Recovering from mess-ups](#).

If you have made changes to files that have also changed in trunk, this may generate merge conflicts that you need to resolve - see the [git rebase](#) man page for some instructions at the end of the "Description" section. There is some related help on merging in the git user manual - see [resolving a merge](#).

### Recovering from mess-ups

Sometimes, you mess up merges or rebases. Luckily, in git it is relatively straightforward to recover from such mistakes.

If you mess up during a rebase:

```
git rebase --abort
```

If you notice you messed up after the rebase:

```
# reset branch back to the saved point
git reset --hard tmp
```

If you forgot to make a backup branch:

```
# look at the reflog of the branch
git reflog show cool-feature

8630830 cool-feature@{0}: commit: BUG: io: close file handles immediately
278dd2a cool-feature@{1}: rebase finished: refs/heads/my-feature-branch onto 11ee694744f2552d
26aa21a cool-feature@{2}: commit: BUG: lib: make seek_gzip_factory not leak gzip obj
...

# reset the branch to where it was before the botched rebase
git reset --hard cool-feature@{2}
```

### Rewriting commit history

---

**Note:** Do this only for your own feature branches.

---

There's an embarrassing typo in a commit you made? Or perhaps the you made several false starts you would like the posterity not to see.

This can be done via *interactive rebasing*.

Suppose that the commit history looks like this:

```
git log --oneline
eadc391 Fix some remaining bugs
a815645 Modify it so that it works
2de1ac Fix a few bugs + disable
13d7934 First implementation
```

(continues on next page)

(continued from previous page)

```
6ad92e5 * masked is now an instance of a new object, MaskedConstant
29001ed Add pre-nep for a copule of structured_array_extensions.
...
```

and 6ad92e5 is the last commit in the `cool-feature` branch. Suppose we want to make the following changes:

- Rewrite the commit message for 13d7934 to something more sensible.
- Combine the commits 2de1ac, a815645, eadc391 into a single one.

We do as follows:

```
# make a backup of the current state
git branch tmp HEAD
# interactive rebase
git rebase -i 6ad92e5
```

This will open an editor with the following text in it:

```
pick 13d7934 First implementation
pick 2de1ac Fix a few bugs + disable
pick a815645 Modify it so that it works
pick eadc391 Fix some remaining bugs

# Rebase 6ad92e5..eadc391 onto 6ad92e5
#
# Commands:
# p, pick = use commit
# r, reword = use commit, but edit the commit message
# e, edit = use commit, but stop for amending
# s, squash = use commit, but meld into previous commit
# f, fixup = like "squash", but discard this commit's log message
#
# If you remove a line here THAT COMMIT WILL BE LOST.
# However, if you remove everything, the rebase will be aborted.
#
```

To achieve what we want, we will make the following changes to it:

```
r 13d7934 First implementation
pick 2de1ac Fix a few bugs + disable
f a815645 Modify it so that it works
f eadc391 Fix some remaining bugs
```

This means that (i) we want to edit the commit message for 13d7934, and (ii) collapse the last three commits into one. Now we save and quit the editor.

Git will then immediately bring up an editor for editing the commit message. After revising it, we get the output:

```
[detached HEAD 721fc64] F00: First implementation
 2 files changed, 199 insertions(+), 66 deletions(-)
[detached HEAD 0f22701] Fix a few bugs + disable
 1 files changed, 79 insertions(+), 61 deletions(-)
Successfully rebased and updated refs/heads/my-feature-branch.
```

and the history looks now like this:

```
0f22701 Fix a few bugs + disable
721fc64 ENH: Sophisticated feature
6ad92e5 * masked is now an instance of a new object, MaskedConstant
```

If it went wrong, recovery is again possible as explained *above*.

### 33.5.5 Maintainer workflow

This page is for maintainers — those of us who merge our own or other peoples' changes into the upstream repository.

Being as how you're a maintainer, you are completely on top of the basic stuff in *Development workflow*.

The instructions in *Linking your repository to the upstream repo* add a remote that has read-only access to the upstream repo. Being a maintainer, you've got read-write access.

It's good to have your upstream remote have a scary name, to remind you that it's a read-write remote:

```
git remote add upstream-rw git@github.com:matplotlib/matplotlib.git
git fetch upstream-rw
```

#### Integrating changes

Let's say you have some changes that need to go into trunk (upstream-rw/master).

The changes are in some branch that you are currently on. For example, you are looking at someone's changes like this:

```
git remote add someone git://github.com/someone/matplotlib.git
git fetch someone
git branch cool-feature --track someone/cool-feature
git checkout cool-feature
```

So now you are on the branch with the changes to be incorporated upstream. The rest of this section assumes you are on this branch.

#### A few commits

If there are only a few commits, consider rebasing to upstream:

```
# Fetch upstream changes
git fetch upstream-rw
# rebase
git rebase upstream-rw/master
```

Remember that, if you do a rebase, and push that, you'll have to close any github pull requests manually, because github will not be able to detect the changes have already been merged.

## A long series of commits

If there are a longer series of related commits, consider a merge instead:

```
git fetch upstream-rw
git merge --no-ff upstream-rw/master
```

The merge will be detected by github, and should close any related pull requests automatically.

Note the `--no-ff` above. This forces git to make a merge commit, rather than doing a fast-forward, so that these set of commits branch off trunk then rejoin the main history with a merge, rather than appearing to have been made directly on top of trunk.

## Check the history

Now, in either case, you should check that the history is sensible and you have the right commits:

```
git log --oneline --graph
git log -p upstream-rw/master..
```

The first line above just shows the history in a compact way, with a text representation of the history graph. The second line shows the log of commits excluding those that can be reached from trunk (`upstream-rw/master`), and including those that can be reached from current HEAD (implied with the `..` at the end). So, it shows the commits unique to this branch compared to trunk. The `-p` option shows the diff for these commits in patch form.

## Push to trunk

```
git push upstream-rw my-new-feature:master
```

This pushes the `my-new-feature` branch in this repository to the `master` branch in the `upstream-rw` repository.

## 33.6 git resources

### 33.6.1 Tutorials and summaries

- [github help](#) has an excellent series of how-to guides.
- The [pro git book](#) is a good in-depth book on git.
- A [git cheat sheet](#) is a page giving summaries of common commands.
- The [git user manual](#)
- The [git tutorial](#)
- The [git community book](#)
- [git ready](#) — a nice series of tutorials

- [git magic](#) — extended introduction with intermediate detail
- The [git parable](#) is an easy read explaining the concepts behind git.
- [git foundation](#) expands on the [git parable](#).
- Fernando Perez' [git page](#) — [Fernando's git page](#) — many links and tips
- A good but technical page on [git concepts](#)
- [git svn crash course](#): git for those of us used to [subversion](#)

### 33.6.2 Advanced git workflow

There are many ways of working with git; here are some posts on the rules of thumb that other projects have come up with:

- Linus Torvalds on [git management](#)
- Linus Torvalds on [linux git workflow](#) . Summary; use the git tools to make the history of your edits as clean as possible; merge from upstream edits as little as possible in branches where you are doing active development.

### 33.6.3 Manual pages online

You can get these on your own machine with (e.g) `git help push` or (same thing) `git push --help`, but, for convenience, here are the online manual pages for some common commands:

- [git add](#)
- [git branch](#)
- [git checkout](#)
- [git clone](#)
- [git commit](#)
- [git config](#)
- [git diff](#)
- [git log](#)
- [git pull](#)
- [git push](#)
- [git remote](#)
- [git status](#)

## 33.7 Two and three dots in difference specs

Thanks to Yarik Halchenko for this explanation.

Imagine a series of commits A, B, C, D... Imagine that there are two branches, *topic* and *master*. You branched *topic* off *master* when *master* was at commit 'E'. The graph of the commits looks like this:

```
A---B---C topic
/
D---E---F---G master
```

Then:

```
git diff master..topic
```

will output the difference from G to C (i.e. with effects of F and G), while:

```
git diff master...topic
```

would output just differences in the topic branch (i.e. only A, B, and C).

## REVIEWERS GUIDELINE

### 34.1 Pull request checklist

#### 34.1.1 Branch selection

In general target the master branch for all new features and bug-fixes. PRs may target maintenance or doc branches on a case-by-case basis.

#### 34.1.2 Documentation

- Every new feature should be documented. If it's a new module, don't forget to add a new rst file to the API docs.
- Each high-level plotting function should have a small example in the `Example` section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go in the `examples` section of the documentation.
- Build the docs and make sure all formatting warnings are addressed.
- See *Writing documentation* for our documentation style guide.
- If your change is a major new feature, add an entry to `doc/users/whats_new.rst`.
- If you change the API in a backward-incompatible way, please document it in `doc/api/api_changes.rst`.

### 34.2 PR Review guidelines

- Be patient and *kind* with contributors.
- If you have commit rights, then you are trusted to use them. Please help review and merge PRs!
- Documentation and examples may be merged by the first reviewer. Use the threshold "is this better than it was?" as the review criteria.
- For code changes (anything in `src` or `lib`) at least two developers (those with commit rights) should review all pull requests. If you are the first to review a PR and approve of the changes use the github '*approve review*' tool to mark it as such. If you are a subsequent reviewer please approve the review and if you think no more review is needed, merge the PR.

Ensure that all API changes are documented in `doc/api/api_changes` and significant new features have an entry in `doc/user/whats_new`.

- Make sure the Travis, Appveyor, circle, and codecov tests are passing before merging.
  - Whenever a pull request is created or updated, Travis and Appveyor automatically runs the test suite on all versions of Python supported by Matplotlib. The `tox` support in Matplotlib may be useful for testing locally.
- Do not self merge, except for 'small' patches to un-break the CI or when another reviewer explicitly allows it (ex, "Approve modulo CI passing, may self merge when green")
- Squashing is case-by-case. The balance is between burden on the contributor, keeping a relatively clean history, and keeping a history usable for bisecting. The only time we are really strict about it is to eliminate binary files (ex multiple test image re-generations) and to remove upstream merges.
- Do not let perfect be the enemy of the good, particularly for documentation or example PRs. If you find yourself making many small suggestions, either open a PR against the original branch, push changes to the contributor branch, or merge the PR and then open a new PR against upstream.
- If you push to a contributor branch leave a comment explaining what you did, ex "I took the liberty of pushing a small clean-up PR to your branch, thanks for your work.". If you are going to make substantial changes to the code or intent of the PR please check with the contributor first.

## 34.3 Branches and Backports

The current active branches are

**master** This will be Matplotlib 3.0. Supports Python 3.5+.

**v2.2.x** Maintenance branch for Matplotlib 2.2 LTS. Supports Python 2.7, 3.4+

**v2.2.N-doc** Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.

We always will backport to 2.2.x

- critical bug fixes (segfault, failure to import, things that the user can not work around)
- fixes for regressions against 2.0 or 2.1

Everything else (regressions against 1.x versions, bugs/api inconsistencies the user can work around in their code) are on a case-by-case basis, should be low-risk, and need someone to advocate for and shepherd through the backport.

The only changes to be backported to 2.2.N-doc are changes to `doc`, `examples`, or `tutorials`. Any changes to `lib` or `src` should not be backported to this branch.

### 34.3.1 Automated backports

We use `meeseeksdev` bot to automatically backport merges to the correct maintenance branch based on the milestone. To work properly the milestone must be set before merging. If you have commit rights, the bot can also be manually triggered after a merge by leaving a message `@meeseeksdev backport to BRANCH` on the PR. If there are conflicts `meeseeksdevs` will inform you that the backport needs to be done manually.

The target branch is configured by putting `on-merge: backport to TARGETBRANCH` in the milestone description on it's own line.

If the bot is not working as expected, please report issues to [Meeseeksdev](#).

### 34.3.2 Manual backports

When doing backports please copy the form used by [meeseekdev](#), `Backport PR #XXXX: TITLE OF PR`. If you need to manually resolve conflicts make note of them and how you resolved them in the commit message.

We do a backport from master to `v2.2.x` assuming:

- `matplotlib` is a read-only remote branch of the `matplotlib/matplotlib` repo

The `TARGET_SHA` is the hash of the merge commit you would like to backport. This can be read off of the github PR page (in the UI with the merge notification) or through the git CLI tools.

Assuming that you already have a local branch `v2.2.x` (if not, then `git checkout -b v2.2.x`), and that your remote pointing to `https://github.com/matplotlib/matplotlib` is called `upstream`:

```
git fetch upstream
git checkout v2.2.x # or include -b if you don't already have this.
git reset --hard upstream/v2.2.x
git cherry-pick -m 1 TARGET_SHA
# resolve conflicts and commit if required
```

Files with conflicts can be listed by `git status`, and will have to be fixed by hand (search on >>>>). Once the conflict is resolved, you will have to re-add the file(s) to the branch and then continue the cherry pick:

```
git add lib/matplotlib/conflicted_file.py
git add lib/matplotlib/conflicted_file2.py
git cherry-pick --continue
```

Use your discretion to push directly to upstream or to open a PR; be sure to push or PR against the `v2.2.x` upstream branch, not `master`!

## RELEASE GUIDE

A guide for developers who are doing a matplotlib release.

### 35.1 All Releases

#### 35.1.1 Testing

We use [travis-ci](#) for continuous integration. When preparing for a release, the final tagged commit should be tested locally before it is uploaded:

```
pytest -n 8 .
```

In addition the following two tests should be run and manually inspected:

```
python unit/memleak_hawaii3.py
pushd examples/tests/
python backend_driver.py
popd
```

#### 35.1.2 GitHub Stats

We automatically extract GitHub issue, PRs, and authors from GitHub via the API:

```
python tools/github_stats.py --since-tag $TAG --project 'matplotlib/matplotlib' --links > doc/
↪users/github_stats.rst
```

Review and commit changes. Some issue/PR titles may not be valid rst (the most common issue is \* which is interpreted as unclosed markup).

#### 35.1.3 Check Docs

Before tagging, update the what's new listing in `doc/users/whats_new.rst` by merging all files in `doc/users/next_whats_new/` coherently. Also, temporarily comment out the `include` and `toctree glob`; re-instate these after a release. Finally, make sure that the docs build cleanly

```
make -Cdoc O=-n$(nproc) html latexpdf
```

After the docs are built, check that all of the links, internal and external, are still valid. We use `linkchecker` for this, which has not been ported to python3 yet. You will need to create a python2 environment with `requests==2.9.0` and `linkchecker`

```
conda create -p /tmp/lnkchk python=2 requests==2.9.0
source activate /tmp/lnkchk
pip install linkchecker
pushd doc/build/html
linkchecker index.html --check-extern
```

Address any issues which may arise. The internal links are checked on travis, this should only flag failed external links.

### 35.1.4 Create release commit and tag

To create the tag, first create an empty commit with a very terse set of the release notes in the commit message

```
git commit --allow-empty
```

and then create a signed, annotated tag with the same text in the body message

```
git tag -a -s v2.0.0
```

which will prompt you for your gpg key password and an annotation. For pre releases it is important to follow **PEP 440** so that the build artifacts will sort correctly in pypi. Finally, push the tag to GitHub

```
git push -t DANGER v2.0.0
```

Congratulations, the scariest part is done!

To prevent issues with any down-stream builders which download the tarball from GitHub it is important to move all branches away from the commit with the tag<sup>1</sup>:

```
git commit --allow-empty
git push DANGER master
```

If this is a final release, also create a 'doc' branch (this is not done for pre-releases):

```
git branch v2.0.0-doc
git push DANGER v2.0.0-doc
```

and if this is a major or minor release, also create a bug-fix branch (a micro release will be cut off of this branch):

---

<sup>1</sup> The tarball that is provided by GitHub is produced using `git archive`. We use `versioneer` which uses a format string in `lib/matplotlib/_version.py` to have `git` insert a list of references to exported commit (see `.gitattributes` for the configuration). This string is then used by `versioneer` to produce the correct version, based on the git tag, when users install from the tarball. However, if there is a branch pointed at the tagged commit, then the branch name will also be included in the tarball. When the branch eventually moves, anyone how checked the hash of the tarball before the branch moved will have an incorrect hash.

To generate the file that GitHub does use

```
git archive v2.0.0 -o matplotlib-2.0.0.tar.gz --prefix=matplotlib-2.0.0/
```

```
git branch v2.0.x
git push DANGER v2.0.x
```

### 35.1.5 Release Management / DOI

Via the GitHub UI (chase down link), turn the newly pushed tag into a release. If this is a pre-release remember to mark it as such.

For final releases also get a DOI from [zenodo](#) and edit `doc/_templates/citing.html` with DOI link and commit to the VER-doc branch and push to GitHub

```
git checkout v2.0.0-doc
emacs doc/_templates/citing.html
git push DANGER v2.0.0-doc:v2.0.0-doc
```

### 35.1.6 Building binaries

We distribute mac, windows, and many linux wheels as well as a source tarball via pypi. Before uploading anything, contact the various builders. Mac and manylinux wheels are built on travis . You need to edit the `.travis.yml` file and push to master of [the build project](#).

Update the master branch (for pre-releases the devel branch) of the [conda-forge feedstock](#) via pull request.

If this is a final release the following downstream packagers should be contacted:

- Debian
- Fedora
- Arch
- Gentoo
- Macports
- Homebrew
- Christoph Gohlke
- Continuum
- Enthought

This can be done ahead of collecting all of the binaries and uploading to pypi.

### 35.1.7 make distribution and upload to pypi / SF

Once you have collected all of the wheels, generate the tarball

```
git checkout v2.0.0
git clean -xfd
python setup.py sdist
```

and copy all of the wheels into `dist` directory. You should use `twine` to upload all of the files to pypi

```
twine upload -s dist/matplotlib*tar.gz
twine upload dist/*whl
```

Congratulations, you have now done the second scariest part!  
Additionally, for a final release, upload all of the files to sourceforge.

### 35.1.8 Build and Deploy Documentation

To build the documentation you must have the tagged version installed, but build the docs from the `ver-doc` branch. An easy way to arrange this is:

```
pip install matplotlib
pip install -r doc-requirements.txt
git checkout v2.0.0-doc
git clean -xfd
cd doc
make O=-n$(nproc) html latexpdf
```

which will build both the html and pdf version of the documentation.

The built documentation exists in the [matplotlib.github.com](https://matplotlib.github.com) repository. Pushing changes to master automatically updates the website.

The documentation is organized by version. At the root of the tree is always the documentation for the latest stable release. Under that, there are directories containing the documentation for older versions. The documentation for current master are built on travis and push to the [devdocs](https://matplotlib.org/devdocs) repository. These are available at [matplotlib.org/devdocs](https://matplotlib.org/devdocs).

Assuming you have this repository checked out in the same directory as matplotlib

```
cd ../matplotlib.github.com
mkdir 2.0.0
rsync -a ../matplotlib/doc/build/html/* 2.0.0
cp ../matplotlib/doc/build/latex/Matplotlib.pdf 2.0.0
```

which will copy the built docs over. If this is a final release, also replace the top-level docs

```
rsync -a 2.0.0/* ./
```

You will need to manually edit `versions.html` to show the last 3 tagged versions. Now commit and push everything to GitHub

```
git add *
git commit -a -m 'Updating docs for v2.0.0'
git push DANGER master
```

Congratulations you have now done the third scariest part!

It typically takes about 5-10 minutes for GitHub to process the push and update the live web page (remember to clear your browser cache).

### 35.1.9 Announcing

The final step is to announce the release to the world. A short version of the release notes along with acknowledgments should be sent to

- [matplotlib-user@python.org](mailto:matplotlib-user@python.org)
- [matplotlib-devel@python.org](mailto:matplotlib-devel@python.org)
- [matplotlib-announce@python.org](mailto:matplotlib-announce@python.org)

For final releases announcements should also be sent to the numpy/scipy/jupyter mailing lists and python-announce.

In addition, announcements should be made on social networks (twitter, g+, FB). For major release, [NumFOCUS](#) should be contacted for inclusion in their newsletter and maybe to have something posted on their blog.

## MINIMUM VERSION OF DEPENDENCIES POLICY

### 36.1 Python and numpy

- support minor versions of Python initially released in the previous 3 years
- support minor versions of numpy initially released in the previous 3 years or oldest that supports the minimum python version (which ever is higher)

We will bump the minimum python and numpy versions as we can every minor and major release, but never on a patch release.

### 36.2 Python Dependencies

For python dependencies we should support at least

**with compiled extensions** minor versions released in the last 3 years or the oldest that support our minimum python + numpy

**without compiled extensions** minor versions released in the last 2 years or the oldest that supports our minimum python.

We will only bump these dependencies as we need new features or the old versions no longer support our minimum numpy or python.

### 36.3 System and C-dependencies

For system or c-dependencies (libpng, freetype, GUI frameworks, latex, gs, ffmpeg) support as old as practical. These can be difficult to install for end-users and we want to be usable on as many systems as possible. We will bump these on a case-by-case basis.

## MATPLOTLIB ENHANCEMENT PROPOSALS

Matplotlib Enhancement Proposals (MEP), inspired by cpython's [PEP's](#) but less formal, are design documents for large or controversial changes to Matplotlib. These documents should provide a discussion of both why and how the changes should be made.

To create a new MEP open a pull request (PR) adding a file based on [the template](#) to this the MEP directory. For the initial PR only a rough description is required and it should be merged quickly. Further detailed discussion can happen in follow on PRs.

### 37.1 MEP Template

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

This MEP template is a guideline of the sections that a MEP should contain. Extra sections may be added if appropriate, and unnecessary sections may be noted as such.

#### 37.1.1 Status

MEPs go through a number of phases in their lifetime:

- **Discussion:** The MEP is being actively discussed on the mailing list and it is being improved by its author. The mailing list discussion of the MEP should include the MEP number (MEPxxx) in the subject line so they can be easily related to the MEP.
- **Progress:** Consensus was reached and implementation work has begun.
- **Completed:** The implementation has been merged into master.
- **Superseded:** This MEP has been abandoned in favor of another approach.
- **Rejected:** There are currently no plans to implement the proposal.

### 37.1.2 Branches and Pull requests

All development branches containing work on this MEP should be linked to from here.

All pull requests submitted relating to this MEP should be linked to from here. (A MEP does not need to be implemented in a single pull request if it makes sense to implement it in discrete phases).

### 37.1.3 Abstract

The abstract should be a short description of what the MEP will achieve.

### 37.1.4 Detailed description

This section describes the need for the MEP. It should describe the existing problem that it is trying to solve and why this MEP makes the situation better. It should include examples of how the new functionality would be used and perhaps some use cases.

### 37.1.5 Implementation

This section lists the major steps required to implement the MEP. Where possible, it should be noted where one step is dependent on another, and which steps may be optionally omitted. Where it makes sense, each step should include a link related pull requests as the implementation progresses.

### 37.1.6 Backward compatibility

This section describes the ways in which the MEP breaks backward incompatibility.

### 37.1.7 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

## 37.2 MEP8: PEP8

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*

- *Backward compatibility*
- *Alternatives*

### 37.2.1 Status

#### **Completed**

We are currently enforcing a sub-set of pep8 on new code contributions.

### 37.2.2 Branches and Pull requests

None so far.

### 37.2.3 Abstract

The matplotlib codebase predates PEP8, and therefore is less than consistent style-wise in some areas. Bringing the codebase into compliance with PEP8 would go a long way to improving its legibility.

### 37.2.4 Detailed description

Some files use four space indentation, some use three. Some use different levels in the same file.

For the most part, class/function/variable naming follows PEP8, but it wouldn't hurt to fix where necessary.

### 37.2.5 Implementation

The implementation should be fairly mechanical: running the pep8 tool over the code and fixing where appropriate.

This should be merged in after the 2.0 release, since the changes will likely make merging any pending pull requests more difficult.

Additionally, and optionally, PEP8 compliance could be tracked by an automated build system.

### 37.2.6 Backward compatibility

Public names of classes and functions that require change (there shouldn't be many of these) should first be deprecated and then removed in the next release cycle.

### 37.2.7 Alternatives

PEP8 is a popular standard for Python code style, blessed by the Python core developers, making any alternatives less desirable.

## 37.3 MEP9: Global interaction manager

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Current summary of the mixin*
- *Backward compatibility*
- *Alternatives*

Add a global manager for all user interactivity with artists; make any artist resizable, moveable, highlightable, and selectable as desired by the user.

### 37.3.1 Status

#### Discussion

### 37.3.2 Branches and Pull requests

<https://github.com/dhyams/matplotlib/tree/MEP9>

### 37.3.3 Abstract

The goal is to be able to interact with matplotlib artists in a very similar way as drawing programs do. When appropriate, the user should be able to move, resize, or select an artist that is already on the canvas. Of course, the script writer is ultimately in control of whether an artist is able to be interacted with, or whether it is static.

This code to do this has already been privately implemented and tested, and would need to be migrated from its current "mixin" implementation, to a bona-fide part of matplotlib.

The end result would be to have four new keywords available to `matplotlib.artist.Artist`: `_moveable_`, `_resizeable_`, `_selectable_`, and `_highlightable_`. Setting any one of these keywords to `True` would activate interactivity for that artist.

In effect, this MEP is a logical extension of event handling in matplotlib; matplotlib already supports "low level" interactions like left mouse presses, a key press, or similar. The MEP extends the support to the logical level, where callbacks are performed on the artists when certain interactive gestures from the user are detected.

### 37.3.4 Detailed description

This new functionality would be used to allow the end-user to better interact with the graph. Many times, a graph is almost what the user wants, but a small repositioning and/or resizing

of components is necessary. Rather than force the user to go back to the script to trial-and-error the location, and simple drag and drop would be appropriate.

Also, this would better support applications that use matplotlib; here, the end-user has no reasonable access or desire to edit the underlying source in order to fine-tune a plot. Here, if matplotlib offered the capability, one could move or resize artists on the canvas to suit their needs. Also, the user should be able to highlight (with a mouse over) an artist, and select it with a double-click, if the application supports that sort of thing. In this MEP, we also want to support the highlighting and selection natively; it is up to application to handle what happens when the artist is selected. A typical handling would be to display a dialog to edit the properties of the artist.

In the future, as well (this is not part of this MEP), matplotlib could offer backend-specific property dialogs for each artist, which are raised on artist selection. This MEP would be a necessary stepping stone for that sort of capability.

There are currently a few interactive capabilities in matplotlib (e.g. `legend.draggable()`), but they tend to be scattered and are not available for all artists. This MEP seeks to unify the interactive interface and make it work for all artists.

The current MEP also includes grab handles for resizing artists, and appropriate boxes drawn when artists are moved or resized.

### 37.3.5 Implementation

- Add appropriate methods to the "tree" of artists so that the interactivity manager has a consistent interface for the interactivity manager to deal with. The proposed methods to add to the artists, if they are to support interactivity, are:
  - `get_pixel_position_ll(self)`: get the pixel position of the lower left corner of the artist's bounding box
  - `get_pixel_size(self)`: get the size of the artist's bounding box, in pixels
  - `set_pixel_position_and_size(self,x,y,dx,dy)`: set the new size of the artist, such that it fits within the specified bounding box.
- add capability to the backends to 1) provide cursors, since these are needed for visual indication of moving/resizing, and 2) provide a function that gets the current mouse position
- Implement the manager. This has already been done privately (by dhyams) as a mixin, and has been tested quite a bit. The goal would be to move the functionality of the manager into the artists so that it is in matplotlib properly, and not as a "monkey patch" as I currently have it coded.

### 37.3.6 Current summary of the mixin

(Note that this mixin is for now just private code, but can be added to a branch obviously)

InteractiveArtistMixin:

Mixin class to make any generic object that is drawn on a matplotlib canvas moveable and possibly resizable. The Powerpoint model is followed as closely as possible; not because I'm enamoured with Powerpoint, but because that's what most people understand. An artist can also be selectable, which means that the artist will receive the `on_activated()` callback when double clicked. Finally, an artist can be highlightable, which means that a highlight is drawn

on the artist whenever the mouse passes over. Typically, highlightable artists will also be selectable, but that is left up to the user. So, basically there are four attributes that can be set by the user on a per-artist basis:

- highlightable
- selectable
- moveable
- resizable

To be moveable (draggable) or resizable, the object that is the target of the mixin must support the following protocols:

- `get_pixel_position_ll(self)`
- `get_pixel_size(self)`
- `set_pixel_position_and_size(self,x,y,sx,sy)`

Note that nonresizable objects are free to ignore the `sx` and `sy` parameters. To be highlightable, the object that is the target of the mixin must also support the following protocol:

- `get_highlight(self)`

Which returns a list of artists that will be used to draw the highlight.

If the object that is the target of the mixin is not a matplotlib artist, the following protocols must also be implemented. Doing so is usually fairly trivial, as there has to be an artist *somewhere* that is being drawn. Typically your object would just route these calls to that artist.

- `get_figure(self)`
- `get_axes(self)`
- `contains(self,event)`
- `set_animated(self,flag)`
- `draw(self,renderer)`
- `get_visible(self)`

The following notifications are called on the artist, and the artist can optionally implement these.

- `on_select_begin(self)`
- `on_select_end(self)`
- `on_drag_begin(self)`
- `on_drag_end(self)`
- `on_activated(self)`
- `on_highlight(self)`
- `on_right_click(self,event)`
- `on_left_click(self,event)`
- `on_middle_click(self,event)`
- `on_context_click(self,event)`
- `on_key_up(self,event)`

- `on_key_down(self,event)`

The following notifications are called on the canvas, if no interactive artist handles the event:

- `on_press(self,event)`
- `on_left_click(self,event)`
- `on_middle_click(self,event)`
- `on_right_click(self,event)`
- `on_context_click(self,event)`
- `on_key_up(self,event)`
- `on_key_down(self,event)`

The following functions, if present, can be used to modify the behavior of the interactive object:

- `press_filter(self,event)` # determines if the object wants to have the press event routed to it
- `handle_unpicked_cursor()` # can be used by the object to set a cursor as the cursor passes over the object when it is unpicked.

Supports multiple canvases, maintaining a drag lock, motion notifier, and a global "enabled" flag per canvas. Supports fixed aspect ratio resizings by holding the shift key during the resize.

Known problems:

- Zorder is not obeyed during the selection/drag operations. Because of the blit technique used, I do not believe this can be fixed. The only way I can think of is to search for all artists that have a zorder greater than me, set them all to animated, and then redraw them all on top during each drag refresh. This might be very slow; need to try.
- the mixin only works for wx backends because of two things: 1) the cursors are hard-coded, and 2) there is a call to `wx.GetMousePosition()` Both of these shortcomings are reasonably fixed by having each backend supply these things.

### 37.3.7 Backward compatibility

No problems with backward compatibility, although once this is in place, it would be appropriate to obsolete some of the existing interactive functions (like `legend.draggable()`)

### 37.3.8 Alternatives

None that I know of.

## 37.4 MEP10: Docstring consistency

- *Status*

- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
  - *Numpy docstring format*
  - *Cross references*
  - *Overriding signatures*
  - *Linking rather than duplicating*
  - *autosummary extension*
  - *Examples linking to relevant documentation*
  - *Documentation using help() vs a browser*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### 37.4.1 Status

#### **Progress**

This is still an on-going effort

### 37.4.2 Branches and Pull requests

### 37.4.3 Abstract

matplotlib has a great deal of inconsistency between docstrings. This not only makes the docs harder to read, but it is harder on contributors, because they don't know which specifications to follow. There should be a clear docstring convention that is followed consistently.

The organization of the API documentation is difficult to follow. Some pages, such as pyplot and axes, are enormous and hard to browse. There should instead be short summary tables that link to detailed documentation. In addition, some of the docstrings themselves are quite long and contain redundant information.

Building the documentation takes a long time and uses a `make.py` script rather than a Makefile.

### 37.4.4 Detailed description

There are number of new tools and conventions available since matplotlib started using Sphinx that make life easier. The following is a list of proposed changes to docstrings, most of which involve these new features.

## Numpy docstring format

**Numpy docstring format:** This format divides the docstring into clear sections, each having different parsing rules that make the docstring easy to read both as raw text and as HTML. We could consider alternatives, or invent our own, but this is a strong choice, as it's well used and understood in the Numpy/Scipy community.

## Cross references

Most of the docstrings in matplotlib use explicit "roles" when linking to other items, for example: `:func:`myfunction``. As of Sphinx 0.4, there is a "default\_role" that can be set to "obj", which will polymorphically link to a Python object of any type. This allows one to write ``myfunction`` instead. This makes docstrings much easier to read and edit as raw text. Additionally, Sphinx allows for setting a current module, so links like ``~matplotlib.axes.Axes.set_xlim`` could be written as ``~axes.Axes.set_xlim``.

## Overriding signatures

Many methods in matplotlib use the `*args` and `**kwargs` syntax to dynamically handle the keyword arguments that are accepted by the function, or to delegate on to another function. This, however, is often not useful as a signature in the documentation. For this reason, many matplotlib methods include something like:

```
def annotate(self, *args, **kwargs):
    """
    Create an annotation: a piece of text referring to a data
    point.

    Call signature::

        annotate(s, xy, xytext=None, xycoords='data',
               textcoords='data', arrowprops=None, **kwargs)
    """
```

This can't be parsed by Sphinx, and is rather verbose in raw text. As of Sphinx 1.1, if the `autodoc_docstring_signature` config value is set to True, Sphinx will extract a replacement signature from the first line of the docstring, allowing this:

```
def annotate(self, *args, **kwargs):
    """
    annotate(s, xy, xytext=None, xycoords='data',
           textcoords='data', arrowprops=None, **kwargs)

    Create an annotation: a piece of text referring to a data
    point.
    """
```

The explicit signature will replace the actual Python one in the generated documentation.

## Linking rather than duplicating

Many of the docstrings include long lists of accepted keywords by interpolating things into the docstring at load time. This makes the docstrings very long. Also, since these tables

are the same across many docstrings, it inserts a lot of redundant information in the docs - particularly a problem in the printed version.

These tables should be moved to docstrings on functions whose only purpose is for help. The docstrings that refer to these tables should link to them, rather than including them verbatim.

### autosummary extension

The Sphinx autosummary extension should be used to generate summary tables, that link to separate pages of documentation. Some classes that have many methods (e.g. `Axes.axes`) should be documented with one method per page, whereas smaller classes should have all of their methods together.

### Examples linking to relevant documentation

The examples, while helpful at illustrating how to use a feature, do not link back to the relevant docstrings. This could be addressed by adding module-level docstrings to the examples, and then including that docstring in the parsed content on the example page. These docstrings could easily include references to any other part of the documentation.

### Documentation using `help()` vs a browser

Using Sphinx markup in the source allows for good-looking docs in your browser, but the markup also makes the raw text returned using `help()` look terrible. One of the aims of improving the docstrings should be to make both methods of accessing the docs look good.

## 37.4.5 Implementation

1. The numpydoc extensions should be turned on for matplotlib. There is an important question as to whether these should be included in the matplotlib source tree, or used as a dependency. Installing Numpy is not sufficient to get the numpydoc extensions - it's a separate install procedure. In any case, to the extent that they require customization for our needs, we should endeavor to submit those changes upstream and not fork them.
2. Manually go through all of the docstrings and update them to the new format and conventions. Updating the cross references (from `:func: myfunc` to `func`)` may be able to be semi-automated. This is a lot of busy work, and perhaps this labor should be divided on a per-module basis so no single developer is over-burdened by it.
3. Reorganize the API docs using autosummary and sphinx-autogen. This should hopefully have minimal impact on the narrative documentation.
4. Modify the example page generator (`gen_rst.py`) so that it extracts the module docstring from the example and includes it in a non-literal part of the example page.
5. Use sphinx-quickstart to generate a new-style Sphinx Makefile. The following features in the current `make.py` will have to be addressed in some other way:
  - Copying of some static content
  - Specifying a "small" build (only low-resolution PNG files for examples)

Steps 1, 2, and 3 are interdependent. 4 and 5 may be done independently, though 5 has some dependency on 3.

### 37.4.6 Backward compatibility

As this mainly involves docstrings, there should be minimal impact on backward compatibility.

### 37.4.7 Alternatives

None yet discussed.

## 37.5 MEP11: Third-party dependencies

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
  - *Current behavior*
  - *Desired behavior*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

This MEP attempts to improve the way in which third-party dependencies in matplotlib are handled.

### 37.5.1 Status

**Completed** - needs to be merged

### 37.5.2 Branches and Pull requests

#1157: Use automatic dependency resolution

#1290: Debundle pyparsing

#1261: Update six to 1.2

### 37.5.3 Abstract

One of the goals of matplotlib has been to keep it as easy to install as possible. To that end, some third-party dependencies are included in the source tree and, under certain circumstances, installed alongside matplotlib. This MEP aims to resolve some problems with that approach, bring some consistency, while continuing to make installation convenient.

At the time that was initially done, `setuptools`, `easy_install` and `PyPI` were not mature enough to be relied on. However, at present, we should be able to safely leverage the “modern” versions of those tools, `distribute` and `pip`.

While `matplotlib` has dependencies on both Python libraries and C/C++ libraries, this MEP addresses only the Python libraries so as to not confuse the issue. C libraries represent a larger and mostly orthogonal set of problems.

### 37.5.4 Detailed description

`matplotlib` depends on the following third-party Python libraries:

- `Numpy`
- `dateutil` (pure Python)
- `pytz` (pure Python)
- `six` - required by `dateutil` (pure Python)
- `pyparsing` (pure Python)
- `PIL` (optional)
- GUI frameworks: `pygtk`, `gobject`, `tkinter`, `PySide`, `PyQt4`, `wx` (all optional, but one is required for an interactive GUI)

#### Current behavior

When installing from source, a `git` checkout or `pip`:

- `setup.py` attempts to import `numpy`. If this fails, the installation fails.
- For each of `dateutil`, `pytz` and `six`, `setup.py` attempts to import them (from the top-level namespace). If that fails, `matplotlib` installs its local copy of the library into the top-level namespace.
- `pyparsing` is always installed inside of the `matplotlib` namespace.

This behavior is most surprising when used with `pip`, because no `pip` dependency resolution is performed, even though it is likely to work for all of these packages.

The fact that `pyparsing` is installed in the `matplotlib` namespace has reportedly (#1290) confused some users into thinking it is a `matplotlib`-related module and import it from there rather than the top-level.

When installing using the Windows installer, `dateutil`, `pytz` and `six` are installed at the top-level *always*, potentially overwriting already installed copies of those libraries.

TODO: Describe behavior with the OS-X installer.

When installing using a package manager (Debian, RedHat, MacPorts etc.), this behavior actually does the right thing, and there are no special patches in the `matplotlib` packages to deal with the fact that we handle `dateutil`, `pytz` and `six` in this way. However, care should be taken that whatever approach we move to continues to work in that context.

Maintaining these packages in the `matplotlib` tree and making sure they are up-to-date is a maintenance burden. Advanced new features that may require a third-party pure Python library have a higher barrier to inclusion because of this burden.

## Desired behavior

Third-party dependencies are downloaded and installed from their canonical locations by leveraging `pip`, `distribute` and `PyPI`.

`dateutil`, `pytz`, and `pyparsing` should be made into optional dependencies - though obviously some features would fail if they aren't installed. This will allow the user to decide whether they want to bother installing a particular feature.

### 37.5.5 Implementation

For installing from source, and assuming the user has all of the C-level compilers and dependencies, this can be accomplished fairly easily using `distribute` and following the instructions [here](#). The only anticipated change to the `matplotlib` library code will be to import `pyparsing` from the top-level namespace rather than from within `matplotlib`. Note that `distribute` will also allow us to remove the direct dependency on `six`, since it is, strictly speaking, only a direct dependency of `dateutil`.

For binary installations, there are a number of alternatives (here ordered from best/hardest to worst/easiest):

1. The `distutils` `wininst` installer allows a post-install script to run. It might be possible to get this script to run `pip` to install the other dependencies. (See [this thread](#) for someone who has trod that ground before).
2. Continue to ship `dateutil`, `pytz`, `six` and `pyparsing` in our installer, but use the post-install-script to install them *only* if they can not already be found.
3. Move all of these packages inside a (new) `matplotlib.extern` namespace so it is clear for outside users that these are external packages. Add some conditional imports in the core `matplotlib` codebase so `dateutil` (at the top-level) is tried first, and failing that `matplotlib.extern.dateutil` is used.

2 and 3 are undesirable as they still require maintaining copies of these packages in our tree - and this is exacerbated by the fact that they are used less - only in the binary installers. None of these 3 approaches address Numpy, which will still have to be manually installed using an installer.

TODO: How does this relate to the Mac OS-X installer?

### 37.5.6 Backward compatibility

At present, `matplotlib` can be installed from source on a machine without the third party dependencies and without an internet connection. After this change, an internet connection (and a working `PyPI`) will be required to install `matplotlib` for the first time. (Subsequent `matplotlib` updates or development work will run without accessing the network).

### 37.5.7 Alternatives

Distributing binary `eggs` doesn't feel like a usable solution. That requires getting `easy_install` installed first, and Windows users generally prefer the well known `exe` or `msi` installer that works out of the box.

## 37.6 MEP12: Improve Gallery and Examples

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
  - *Gallery sections*
  - *Clean up guidelines*
    - \* *Additional suggestions*
- *Backward compatibility*
- *Alternatives*
  - *Tags*

### 37.6.1 Status

#### Progress

Initial changes added in 1.3. Conversion of the gallery is on-going. 29 September 2015 - The last `pylab_examples` where `pylab` is imported has been converted over to use `matplotlib.pyplot` and `numpy`.

### 37.6.2 Branches and Pull requests

#1623, #1924, #2181

PR #2474 <<https://github.com/matplotlib/matplotlib/pull/2474>>\_ demonstrates a single example being cleaned up and moved to the appropriate section.

### 37.6.3 Abstract

Reorganizing the matplotlib plot gallery would greatly simplify navigation of the gallery. In addition, examples should be cleaned-up and simplified for clarity.

### 37.6.4 Detailed description

The matplotlib gallery was recently set up to split examples up into sections. As discussed in that PR<sup>1</sup>, the current example sections (`api`, `pylab_examples`) aren't terribly useful to users: New sections in the gallery would help users find relevant examples.

---

<sup>1</sup> <https://github.com/matplotlib/matplotlib/pull/714>

These sections would also guide a cleanup of the examples: Initially, all the current examples would remain and be listed under their current directories. Over time, these examples could be cleaned up and moved into one of the new sections.

This process allows users to easily identify examples that need to be cleaned up; i.e. anything in the `api` and `pylab_examples` directories.

### 37.6.5 Implementation

1. Create new gallery sections. [Done]
2. Clean up examples and move them to the new gallery sections (over the course of many PRs and with the help of many users/developers). [In progress]

#### Gallery sections

The naming of sections is critical and will guide the clean-up effort. The current sections are:

- Lines, bars, and markers (more-or-less 1D data)
- Shapes and collections
- Statistical plots
- Images, contours, and fields
- Pie and polar charts: Round things
- Color
- Text, labels, and annotations
- Ticks and spines
- Subplots, axes, and figures
- Specialty plots (e.g., sankey, radar, tornado)
- Showcase (plots with tweaks to make them publication-quality)
- separate sections for toolboxes (already exists: `'mplot3d'`, `'axes_grid'`, `'units'`, `'widgets'`)

These names are certainly up for debate. As these sections grow, we should reevaluate them and split them up as necessary.

#### Clean up guidelines

The current examples in the `api` and `pylab_examples` sections of the gallery would remain in those directories until they are cleaned up. After clean-up, they would be moved to one of the new gallery sections described above. "Clean-up" should involve:

- `sphinx-gallery docstrings`: a title and a description of the example formatted as follows, at the top of the example:

```
"""
=====
Colormaps alter your perception
=====
```

(continues on next page)

(continued from previous page)

```

Here I plot the function

.. math:: f(x, y) = \sin(x) + \cos(y)

with different colormaps. Look at how colormaps alter your perception!
"""

```

- PEP8 clean-ups (running [flake8](#), or a similar checker, is highly recommended)
- Commented-out code should be removed.
- Replace uses of pylab interface with pyplot (+ numpy, etc.). See [c25ef1e](#)
- Remove shebang line, e.g.:
 

```
#!/usr/bin/env python
```
- Use consistent imports. In particular:
 

```
import numpy as np
import matplotlib.pyplot as plt
```

 Avoid importing specific functions from these modules (e.g. from `numpy import sin`)
- Each example should focus on a specific feature (excluding showcase examples, which will show more "polished" plots). Tweaking unrelated to that feature should be removed. See [f7b2217](#), [e57b5fc](#), and [1458aa8](#)

Use of pylab should be demonstrated/discussed on a dedicated help page instead of the gallery examples.

**Note:** When moving an existing example, you should search for references to that example. For example, the API documentation for `axes.py` and `pyplot.py` may use these examples to generate plots. Use your favorite search tool (e.g., `grep`, `ack`, [grin](#), [pss](#)) to search the matplotlib package. See [2dc9a46](#) and [aa6b410](#)

### Additional suggestions

- Provide links (both ways) between examples and API docs for the methods/objects used. (issue [#2222](#))
- Use `plt.subplots` (note trailing "s") in preference over `plt.subplot`.
- Rename the example to clarify it's purpose. For example, the most basic demo of `imshow` might be `imshow_demo.py`, and one demonstrating different interpolation settings would be `imshow_demo_interpolation.py` (*not* `imshow_demo2.py`).
- Split up examples that try to do too much. See [5099675](#) and [fc2ab07](#)
- Delete examples that don't show anything new.
- Some examples exercise esoteric features for unit testing. These tweaks should be moved out of the gallery to an example in the `unit` directory located in the root directory of the package.
- Add plot titles to clarify intent of the example. See [bd2b13c](#)

### 37.6.6 Backward compatibility

The website for each Matplotlib version is readily accessible, so users who want to refer to old examples can still do so.

### 37.6.7 Alternatives

#### Tags

Tagging examples will also help users search the example gallery. Although tags would be a big win for users with specific goals, the plot gallery will remain the entry point to these examples, and sections could really help users navigate the gallery. Thus, tags are complementary to this reorganization.

## 37.7 MEP13: Use properties for Artists

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Examples*
  - *`axes.Axes.set_axis_off/set_axis_on`*
  - *`axes.Axes.get_xlim/set_xlim` and `get_autoscalex_on/set_autoscalex_on`*
  - *`axes.Axes.get_title/set_title`*
  - *`axes.Axes.get_xticklabels/set_xticklabels`*
- *Alternatives*

### 37.7.1 Status

- **Discussion**

### 37.7.2 Branches and Pull requests

None

### 37.7.3 Abstract

Wrap all of the matplotlib getter and setter methods with python `properties`, allowing them to be read and written like class attributes.

### 37.7.4 Detailed description

Currently matplotlib uses getter and setter functions (usually prefixed with `get_` and `set_`, respectively) for reading and writing data related to classes. However, since 2.6 python supports properties, which allow such setter and getter functions to be accessed as though they were attributes. This proposal would implement all existing setter and getter methods as properties.

### 37.7.5 Implementation

1. All existing getter and setter methods will need to have two aliases, one with the `get_` or `set_` prefix and one without. Getter methods that currently lack prefixes should be recording in a text file.
2. Classes should be reorganized so setter and getter methods are sequential in the code, with getter methods first.
3. Getter and setter methods the provide additional optional optional arguments should have those arguments accessible in another manner, either as additional getter or setter methods or attributes of other classes. If those classes are not accessible, getters for them should be added.
4. Property decorators will be added to the setter and getter methods without the prefix. Those with the prefix will be marked as deprecated.
5. Docstrings will need to be rewritten so the getter with the prefix has the current docstring and the getter without the prefix has a generic docstring appropriate for an attribute.
6. Automatic alias generation will need to be modified so it will also create aliases for the properties.
7. All instances of getter and setter method calls will need to be changed to attribute access.
8. All setter and getter aliases with prefixes will be removed

The following steps can be done simultaneously: 1, 2, and 3; 4 and 5; 6 and 7.

Only the following steps must be done in the same release: 4, 5, and 6. All other changes can be done in separate releases. 8 should be done several major releases after everything else.

### 37.7.6 Backward compatibility

All existing getter methods that do not have a prefix (such as `get_`) will need to be changed from function calls to attribute access. In most cases this will only require removing the parenthesis.

setter and getter methods that have additional optional arguments will need to have those arguments implemented in another way, either as a separate property in the same class or as attributes or properties of another class.

Cases where the setter returns a value will need to be changed to using the setter followed by the getter.

Cases where there are `set_ATTR_on()` and `set_ATTR_off()` methods will be changed to `ATTR_on` properties.

### 37.7.7 Examples

#### `axes.Axes.set_axis_off/set_axis_on`

Current implementation:

```
axes.Axes.set_axis_off()
axes.Axes.set_axis_on()
```

New implementation:

```
True = axes.Axes.axis_on
False = axes.Axes.axis_off
axes.Axes.axis_on = True
axes.Axes.axis_off = False
```

#### `axes.Axes.get_xlim/set_xlim` and `get_autoscalex_on/set_autoscalex_on`

Current implementation:

```
[left, right] = axes.Axes.get_xlim()
auto = axes.Axes.get_autoscalex_on()

[left, right] = axes.Axes.set_xlim(left=left, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, right=None, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=None, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(right=right, emit=emit, auto=auto)

axes.Axes.set_autoscalex_on(auto)
```

New implementation:

```
[left, right] = axes.Axes.axes_xlim
auto = axes.Axes.autoscalex_on

axes.Axes.axes_xlim = [left, right]
axes.Axes.axes_xlim = [left, None]
axes.Axes.axes_xlim = [None, right]
axes.Axes.axes_xlim[0] = left
axes.Axes.axes_xlim[1] = right

axes.Axes.autoscalex_on = auto

axes.Axes.emit_xlim = emit
```

### axes.Axes.get\_title/set\_title

Current implementation:

```
string = axes.Axes.get_title()
axes.Axes.set_title(string, fontdict=fontdict, **kwargs)
```

New implementation:

```
string = axes.Axes.title
string = axes.Axes.title_text.text

text.Text = axes.Axes.title_text
text.Text.<attribute> = attribute
text.Text.fontdict = fontdict

axes.Axes.title = string
axes.Axes.title = text.Text
axes.Axes.title_text = string
axes.Axes.title_text = text.Text
```

### axes.Axes.get\_xticklabels/set\_xticklabels

Current implementation:

```
[text.Text] = axes.Axes.get_xticklabels()
[text.Text] = axes.Axes.get_xticklabels(minor=False)
[text.Text] = axes.Axes.get_xticklabels(minor=True)
[text.Text] = axes.Axes.([string], fontdict=None, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=False, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=True, **kwargs)
```

New implementation:

```
[text.Text] = axes.Axes.xticklabels
[text.Text] = axes.Axes.xminorticklabels
axes.Axes.xticklabels = [string]
axes.Axes.xminorticklabels = [string]
axes.Axes.xticklabels = [text.Text]
axes.Axes.xminorticklabels = [text.Text]
```

## 37.7.8 Alternatives

Instead of using decorators, it is also possible to use the property function. This would change the procedure so that all getter methods that lack a prefix will need to be renamed or removed. This makes handling docstrings more difficult and harder to read.

It is not necessary to deprecate the setter and getter methods, but leaving them in will complicate the code.

This could also serve as an opportunity to rewrite or even remove automatic alias generation.

Another alternate proposal:

Convert `set_xlim`, `set_xlabel`, `set_title`, etc. to `xlim`, `xlabel`, `title`,... to make the transition from `plt` functions to axes methods significantly simpler. These would still be methods, not properties, but it's still a great usability enhancement while retaining the interface.

## 37.8 MEP14: Text handling

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### 37.8.1 Status

- **Discussion**

### 37.8.2 Branches and Pull requests

Issue #253 demonstrates a bug where using the bounding box rather than the advance width of text results in misaligned text. This is a minor point in the grand scheme of things, but it should be addressed as part of this MEP.

### 37.8.3 Abstract

By reorganizing how text is handled, this MEP aims to:

- improve support for Unicode and non-ltr languages
- improve text layout (especially multi-line text)
- allow support for more fonts, especially non-Apple-format TrueType fonts and OpenType fonts.
- make the font configuration easier and more transparent

### 37.8.4 Detailed description

#### Text layout

At present, matplotlib has two different ways to render text: "built-in" (based on FreeType and our own Python code), and "usetex" (based on calling out to a TeX installation). Adjunct to the "built-in" renderer there is also the Python-based "mathtext" system for rendering

mathematical equations using a subset of the TeX language without having a TeX installation available. Support for these two engines is strewn about many source files, including every backend, where one finds clauses like

```
if rcParams['text.usetex']: # do one thing else: # do another
```

Adding a third text rendering approach (more on that later) would require editing all of these places as well, and therefore doesn't scale.

Instead, this MEP proposes adding a concept of "text engines", where the user could select one of many different approaches for rendering text. The implementations of each of these would be localized to their own set of modules, and not have little pieces around the whole source tree.

Why add more text rendering engines? The "built-in" text rendering has a number of shortcomings.

- It only handles right-to-left languages, and doesn't handle many special features of Unicode, such as combining diacriticals.
- The multiline support is imperfect and only supports manual line-breaking - it can not break up a paragraph into lines of a certain length.
- It also does not handle inline formatting changes in order to support something like Markdown, reStructuredText or HTML. (Though rich-text formatting is contemplated in this MEP, since we want to make sure this design allows it, the specifics of a rich-text formatting implementation is outside of the scope of this MEP.)

Supporting these things is difficult, and is the "full-time job" of a number of other projects:

- [pango/harfbuzz](#)
- [QtTextLayout](#)
- [Microsoft DirectWrite](#)
- [Apple Core Text](#)

Of the above options, it should be noted that `harfbuzz` is designed from the start as a cross platform option with minimal dependencies, so therefore is a good candidate for a single option to support.

Additionally, for supporting rich text, we could consider using [WebKit](#), and possibly whether that represents a good single cross-platform option. Again, however, rich text formatting is outside of the scope of this project.

Rather than trying to reinvent the wheel and add these features to matplotlib's "built-in" text renderer, we should provide a way to leverage these projects to get more powerful text layout. The "built-in" renderer will still need to exist for reasons of ease of installation, but its feature set will be more limited compared to the others. [TODO: This MEP should clearly decide what those limited features are, and fix any bugs to bring the implementation into a state of working correctly in all cases that we want it to work. I know @leejjoon has some thoughts on this.]

### Font selection

Going from an abstract description of a font to a file on disk is the task of the font selection algorithm - it turns out to be much more complicated than it seems at first.

The "built-in" and "usetex" renderers have very different ways of handling font selection, given their different technologies. TeX requires the installation of TeX-specific font packages, for example, and can not use TrueType fonts directly. Unfortunately, despite the different

semantics for font selection, the same set of font properties are used for each. This is true of both the `FontProperties` class and the font-related `rcParams` (which basically share the same code underneath). Instead, we should define a core set of font selection parameters that will work across all text engines, and have engine-specific configuration to allow the user to do engine-specific things when required. For example, it is possible to directly select a font by name in the “built-in” using `font.family`, but the same is not possible with “usetex”. It may be possible to make it easier to use TrueType fonts by using XeTeX, but users will still want to use the traditional metafonts through TeX font packages. So the issue still stands that different text engines will need engine-specific configuration, and it should be more obvious to the user which configuration will work across text engines and which are engine-specific.

Note that even excluding “usetex”, there are different ways to find fonts. The default is to use the font list cache in `font_manager.py` which matches fonts using our own algorithm based on the [CSS font matching algorithm](#). It doesn’t always do the same thing as the native font selection algorithms on Linux (`fontconfig`), Mac and Windows, and it doesn’t always find all of the fonts on the system that the OS would normally pick up. However, it is cross-platform, and always finds the fonts that ship with matplotlib. The Cairo and MacOSX backends (and presumably a future HTML5-based backend) currently bypass this mechanism and use the OS-native ones. The same is true when not embedding fonts in SVG, PS or PDF files and opening them in a third-party viewer. A downside there is that (at least with Cairo, need to confirm with MacOSX) they don’t always find the fonts we ship with matplotlib. (It may be possible to add the fonts to their search path, though, or we may need to find a way to install our fonts to a location the OS expects to find them).

There are also special modes in the PS and PDF to only use the core fonts that are always available to those formats. There, the font lookup mechanism must only match against those fonts. It is unclear whether the OS-native font lookup systems can handle this case.

There is also experimental support for using `fontconfig` for font selection in matplotlib, turned off by default. `fontconfig` is the native font selection algorithm on Linux, but is also cross platform and works well on the other platforms (though obviously is an additional dependency there).

Many of the text layout libraries proposed above (`pango`, `QtTextLayout`, `DirectWrite` and `Core-Text` etc.) insist on using the font selection library from their own ecosystem.

All of the above seems to suggest that we should move away from our self-written font selection algorithm and use the native APIs where possible. That’s what Cairo and MacOSX backends already want to use, and it will be a requirement of any complex text layout library. On Linux, we already have the bones of a `fontconfig` implementation (which could also be accessed through `pango`). On Windows and Mac we may need to write custom wrappers. The nice thing is that the API for font lookup is relatively small, and essentially consist of “given a dictionary of font properties, give me a matching font file”.

### Font subsetting

Font subsetting is currently handled using `ttconv`. `ttconv` was a standalone commandline utility for converting TrueType fonts to subsetted Type 3 fonts (among other features) written in 1995, which matplotlib (well, I) forked in order to make it work as a library. It only handles Apple-style TrueType fonts, not ones with the Microsoft (or other vendor) encodings. It doesn’t handle OpenType fonts at all. This means that even though the STIX fonts come as `.otf` files, we have to convert them to `.ttf` files to ship them with matplotlib. The Linux packagers hate this – they’d rather just depend on the upstream STIX fonts. `ttconv` has also been shown to have a few bugs that have been difficult to fix over time.

Instead, we should be able to use FreeType to get the font outlines and write our own code (probably in Python) to output subsetted fonts (Type 3 on PS and PDF and `SVGFonts` or paths on SVG). FreeType, as a popular and well-maintained project, handles a wide variety of fonts

in the wild. This would remove a lot of custom C code, and remove some code duplication between backends.

Note that subsetting fonts this way, while the easiest route, does lose the hinting in the font, so we will need to continue, as we do now, provide a way to embed the entire font in the file where possible.

Alternative font subsetting options include using the subsetting built-in to Cairo (not clear if it can be used without the rest of Cairo), or using `fontforge` (which is a heavy and not terribly cross-platform dependency).

### **Freetype wrappers**

Our FreeType wrapper could really use a reworking. It defines its own image buffer class (when a Numpy array would be easier). While FreeType can handle a huge diversity of font files, there are limitations to our wrapper that make it much harder to support non-Apple-vendor TrueType files, and certain features of OpenType files. (See #2088 for a terrible result of this, just to support the fonts that ship with Windows 7 and 8). I think a fresh rewrite of this wrapper would go a long way.

### **Text anchoring and alignment and rotation**

The handling of baselines was changed in 1.3.0 such that the backends are now given the location of the baseline of the text, not the bottom of the text. This is probably the correct behavior, and the MEP refactoring should also follow this convention.

In order to support alignment on multi-line text, it should be the responsibility of the (proposed) text engine to handle text alignment. For a given chunk of text, each engine calculates a bounding box for that text and the offset of the anchor point within that box. Therefore, if the va of a block was "top", the anchor point would be at the top of the box.

Rotating of text should always be around the anchor point. I'm not sure that lines up with current behavior in matplotlib, but it seems like the sanest/least surprising choice. [This could be revisited once we have something working]. Rotation of text should not be handled by the text engine - that should be handled by a layer between the text engine and the rendering backend so it can be handled in a uniform way. [I don't see any advantage to rotation being handled by the text engines individually...]

There are other problems with text alignment and anchoring that should be resolved as part of this work. [TODO: enumerate these].

### **Other minor problems to fix**

The `mathtext` code has backend-specific code - it should instead provide its output as just another text engine. However, it's still desirable to have `mathtext` layout inserted as part of a larger layout performed by another text engine, so it should be possible to do this. It's an open question whether embedding the text layout of an arbitrary text engine in another should be possible.

The text mode is currently set by a global `rcParam` ("`text.usetex`") so it's either all on or all off. We should continue to have a global `rcParam` to choose the text engine ("`text.layout_engine`"), but it should under the hood be an overridable property on the `Text` object, so the same figure can combine the results of multiple text layout engines if necessary.

## **37.8.5 Implementation**

A concept of a "text engine" will be introduced. Each text engine will implement a number of abstract classes. The `TextFont` interface will represent text for a given set of font properties. It isn't necessarily limited to a single font file - if the layout engine supports rich text, it

may handle a number of font files in a family. Given a `TextFont` instance, the user can get a `TextLayout` instance, which represents the layout for a given string of text in a given font. From a `TextLayout`, an iterator over `TextSpans` is returned so the engine can output raw editable text using as few spans as possible. If the engine would rather get individual characters, they can be obtained from the `TextSpan` instance:

```
class TextFont(TextFontBase):
    def __init__(self, font_properties):
        """
        Create a new object for rendering text using the given font properties.
        """
        pass

    def get_layout(self, s, ha, va):
        """
        Get the TextLayout for the given string in the given font and
        the horizontal (left, center, right) and verticalalignment (top,
        center, baseline, bottom)
        """
        pass

class TextLayout(TextLayoutBase):
    def get_metrics(self):
        """
        Return the bounding box of the layout, anchored at (0, 0).
        """
        pass

    def get_spans(self):
        """
        Returns an iterator over the spans of different in the layout.
        This is useful for backends that want to editable raw text as
        individual lines. For rich text where the font may change,
        each span of different font type will have its own span.
        """
        pass

    def get_image(self):
        """
        Returns a rasterized image of the text. Useful for raster backends,
        like Agg.

        In all likelihood, this will be overridden in the backend, as it can
        be created from get_layout(), but certain backends may want to
        override it if their library provides it (as freetype does).
        """
        pass

    def get_rectangles(self):
        """
        Returns an iterator over the filled black rectangles in the layout.
        Used by TeX and mathtext for drawing, for example, fraction lines.
        """
        pass

    def get_path(self):
        """
        Returns a single Path object of the entire laid out text.
```

(continues on next page)

```

        [Not strictly necessary, but might be useful for texpath
        functionality]
        """
        pass

class TextSpan(TextSpanBase):
    x, y      # Position of the span -- relative to the text layout as a whole
              # where (0, 0) is the anchor. y is the baseline of the span.
    fontfile  # The font file to use for the span
    text      # The text content of the span

    def get_path(self):
        pass # See TextLayout.get_path

    def get_chars(self):
        """
        Returns an iterator over the characters in the span.
        """
        pass

class TextChar(TextCharBase):
    x, y      # Position of the character -- relative to the text layout as
              # a whole, where (0, 0) is the anchor. y is in the baseline
              # of the character.
    codepoint # The unicode code point of the character -- only for informational
              # purposes, since the mapping of codepoint to glyph_id may have been
              # handled in a complex way by the layout engine. This is an int
              # to avoid problems on narrow Unicode builds.
    glyph_id  # The index of the glyph within the font
    fontfile  # The font file to use for the char

    def get_path(self):
        """
        Get the path for the character.
        """
        pass

```

Graphic backends that want to output subset of fonts would likely build up a file-global dictionary of characters where the keys are (fontname, glyph\_id) and the values are the paths so that only one copy of the path for each character will be stored in the file.

Special casing: The “usetex” functionality currently is able to get Postscript directly from TeX to insert directly in a Postscript file, but for other backends, parses a DVI file and generates something more abstract. For a case like this, TextLayout would implement get\_spans for most backends, but add get\_ps for the Postscript backend, which would look for the presence of this method and use it if available, or fall back to get\_spans. This kind of special casing may also be necessary, for example, when the graphics backend and text engine belong to the same ecosystem, e.g. Cairo and Pango, or MacOSX and CoreText.

There are three main pieces to the implementation:

1. Rewriting the freetype wrapper, and removing ttconv.
1. Once (1) is done, as a proof of concept, we can move to the upstream STIX .otf fonts
2. Add support for web fonts loaded from a remote URL. (Enabled by using freetype for font subsetting).

2. Refactoring the existing "builtin" and "usetex" code into separate text engines and to follow the API outlined above.
  3. Implementing support for advanced text layout libraries.
- (1) and (2) are fairly independent, though having (1) done first will allow (2) to be simpler. (3) is dependent on (1) and (2), but even if it doesn't get done (or is postponed), completing (1) and (2) will make it easier to move forward with improving the "builtin" text engine.

### 37.8.6 Backward compatibility

The layout of text with respect to its anchor and rotation will change in hopefully small, but improved, ways. The layout of multiline text will be much better, as it will respect horizontal alignment. The layout of bidirectional text or other advanced Unicode features will now work inherently, which may break some things if users are currently using their own workarounds.

Fonts will be selected differently. Hacks that used to sort of work between the "builtin" and "usetex" text rendering engines may no longer work. Fonts found by the OS that weren't previously found by matplotlib may be selected.

### 37.8.7 Alternatives

TBD

## 37.9 MEP15 - Fix axis autoscaling when limits are specified for one axis only

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### 37.9.1 Status

#### Discussion

### 37.9.2 Branches and Pull requests

None so far.

### 37.9.3 Abstract

When one axis of a 2-dimensional plot is overridden via `xlim` or `ylim`, automatic scaling of the remaining axis should be based on the data that falls within the specified limits of the first axis.

### 37.9.4 Detailed description

When axis limits for a 2-D plot are specified for one axis only (via `xlim` or `ylim`), matplotlib currently does not currently rescale the other axis. The result is that the displayed curves or symbols may be compressed into a tiny portion of the available area, so that the final plot conveys much less information than it would with appropriate axis scaling.

The proposed change of behavior would make matplotlib choose the scale for the remaining axis using only the data that falls within the limits for the axis where limits were specified.

### 37.9.5 Implementation

I don't know enough about the internals of matplotlib to be able to suggest an implementation.

### 37.9.6 Backward compatibility

From the standpoint of software interfaces, there would be no break in backward compatibility. Some outputs would be different, but if the user truly desires the previous behavior, he/she can achieve this by overriding the axis scaling for both axes.

### 37.9.7 Alternatives

The only alternative that I can see is to maintain the status quo.

## 37.10 MEP19: Continuous Integration

### 37.10.1 Status

**Completed**

### 37.10.2 Branches and Pull requests

### 37.10.3 Abstract

matplotlib could benefit from better and more reliable continuous integration, both for testing and building installers and documentation.

## 37.10.4 Detailed description

### Current state-of-the-art

#### Testing

matplotlib currently uses Travis-CI for automated tests. While Travis-CI should be praised for how much it does as a free service, it has a number of shortcomings:

- It often fails due to network timeouts when installing dependencies.
- It often fails for inexplicable reasons.
- build or test products can only be saved from build off of branches on the main repo, not pull requests, so it is often difficult to "post mortem" analyse what went wrong. This is particularly frustrating when the failure can not be subsequently reproduced locally.
- It is not extremely fast. matplotlib's cpu and memory requirements for testing are much higher than the average Python project.
- It only tests on Ubuntu Linux, and we have only minimal control over the specifics of the platform. It can be upgraded at any time outside of our control, causing unexpected delays at times that may not be convenient in our release schedule.

On the plus side, Travis-CI's integration with github - automatically testing all pending pull requests - is exceptional.

#### Builds

There is no centralized effort for automated binary builds for matplotlib. However, the following disparate things are being done [If the authors mentioned here could fill in detail, that would be great!]:

- @sandrotosi: builds Debian packages
- @takluyver: Has automated Ubuntu builds on Launchpad
- @cgohlke: Makes Windows builds (don't know how automated that is)
- @r-owen: Makes OS-X builds (don't know how automated that is)

#### Documentation

Documentation of master is now built by travis and uploaded to <http://matplotlib.org/devdocs/index.html>

@NelleV, I believe, generates the docs automatically and posts them on the web to chart MEP10 progress.

#### Peculiarities of matplotlib

matplotlib has complex requirements that make testing and building more taxing than many other Python projects.

- The CPU time to run the tests is quite high. It puts us beyond the free accounts of many CI services (e.g. ShiningPanda)
- It has a large number of dependencies, and testing the full matrix of all combinations is impractical. We need to be clever about what space we test and guarantee to support.

## Requirements

This section outlines the requirements that we would like to have.

1. Testing all pull requests by hooking into the Github API, as Travis-CI does
2. Testing on all major platforms: Linux, Mac OS-X, MS Windows (in that order of priority, based on user survey)
3. Retain the last n days worth of build and test products, to aid in post-mortem debugging.
4. Automated nightly binary builds, so that users can test the bleeding edge without installing a complete compilation environment.
5. Automated benchmarking. It would be nice to have a standard benchmark suite (separate from the tests) whose performance could be tracked over time, in different backends and platforms. While this is separate from building and testing, ideally it would run on the same infrastructure.
6. Automated nightly building and publishing of documentation (or as part of testing, to ensure PRs don't introduce documentation bugs). (This would not replace the static documentation for stable releases as a default).
7. The test systems should be manageable by multiple developers, so that no single person becomes a bottleneck. (Travis-CI's design does this well - storing build configuration in the git repository, rather than elsewhere, is a very good design.)
8. Make it easy to test a large but sparse matrix of different versions of matplotlib's dependencies. The matplotlib user survey provides some good data as to where to focus our efforts: <https://docs.google.com/spreadsheets/ccc?key=0AjrPjITMRTwTdHpQS25pcTZIRWdqX0pNckNSU01sMHc#gid=0>
9. Nice to have: A decentralized design so that those with more obscure platforms can publish build results to a central dashboard.

### 37.10.5 Implementation

This part is yet-to-be-written.

However, ideally, the implementation would be a third-party service, to avoid adding system administration to our already stretched time. As we have some donated funds, this service may be a paid one if it offers significant time-saving advantages over free offerings.

### 37.10.6 Backward compatibility

Backward compatibility is not a major concern for this MEP. We will replace current tools and procedures with something better and throw out the old.

### 37.10.7 Alternatives

### 37.10.8 Hangout Notes

## CI Infrastructure

- We like Travis and it will probably remain part of our arsenal in any event. The reliability issues are being looked into.
- Enable Amazon S3 uploads of testing products on Travis. This will help with post-mortem of failures (@mdboom is looking into this now).
- We want Mac coverage. The best bet is probably to push Travis to enable it for our project by paying them for a Pro account (since they don't otherwise allow testing on both Linux and Mac).
- We want Windows coverage. Shining Panda is an option there.
- Investigate finding or building a tool that would collect and synthesize test results from a number of sources and post it to Github using the Github API. This may be of general use to the Scipy community.
- For both Windows and Mac, we should document (or better yet, script) the process of setting up the machine for a build, and how to build binaries and installers. This may require getting information from Russel Owen and Christoph Gohlke. This is a necessary step for doing automated builds, but would also be valuable for a number of other reasons.

## The test framework itself

- We should investigate ways to make it take less time
  - Eliminating redundant tests, if possible
  - General performance improvements to matplotlib will help
- We should be covering more things, particularly more backends
- We should have more unit tests, fewer integration tests, if possible

## 37.11 MEP21: color and cm refactor

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### 37.11.1 Status

- **Discussion:** This MEP has not commenced yet, but here are some ongoing ideas which may become a part of this MEP:

### 37.11.2 Branches and Pull requests

### 37.11.3 Abstract

- color
  - tidy up the namespace
  - Define a "Color" class
  - make it easy to convert from one color type to another ``hex` -> RGB`, `RGB` -> hex`, `HSV` -> RGB` etc.`
  - improve the construction of a colormap - the dictionary approach is archaic and overly complex (though incredibly powerful)
  - make it possible to interpolate between two or more color types in different modes, especially useful for construction of colormaps in HSV space for instance
- cm
  - rename the module to something more descriptive - mappables?

Overall, there are a lot of improvements that can be made with matplotlib color handling - managing backwards compatibility will be difficult as there are some badly named variables/modules which really shouldn't exist - but a clear path and message for migration should be available, with a large amount of focus on this in the API changes documentation.

- <https://github.com/matplotlib/matplotlib/pull/2557>
- <https://github.com/matplotlib/matplotlib/pull/2465>

#### Pull Requests:

- Removing the NavigationToolbar classes <https://github.com/matplotlib/matplotlib/pull/2740> **CLOSED**
- Keeping the NavigationToolbar classes <https://github.com/matplotlib/matplotlib/pull/2759> **CLOSED**
- Navigation by events: <https://github.com/matplotlib/matplotlib/pull/3652>

### 37.12.3 Abstract

The main goal of this MEP is to make it easier to modify (add, change, remove) the way the user interacts with the figures.

The user interaction with the figure is deeply integrated within the Canvas and Toolbar. Making extremely difficult to do any modification.

This MEP proposes the separation of this interaction into Toolbar, Navigation and Tools to provide independent access and reconfiguration.

This approach will make easier to create and share tools among users. In the far future, we can even foresee a kind of Marketplace for Tools where the most popular can be added into the main distribution.

### 37.12.4 Detailed description

The reconfiguration of the Toolbar is complex, most of the time it requires a custom backend.

The creation of custom Tools sometimes interferes with the Toolbar, as example see <https://github.com/matplotlib/matplotlib/issues/2694> also the shortcuts are hardcoded and again not easily modifiable <https://github.com/matplotlib/matplotlib/issues/2699>

The proposed solution is to take the actions out of the Toolbar and the shortcuts out of the Canvas. This actions and shortcuts will be in the form of Tools.

A new class Navigation will be the bridge between the events from the Canvas and Toolbar and redirect them to the appropriate Tool.

At the end the user interaction will be divided into three classes:

- NavigationBase: This class is instantiated for each FigureManager and connect the all user interactions with the Tools
- ToolbarBase: This existing class is relegated only as a GUI access to Tools.
- ToolBase: Is the basic definition of Tools.

### 37.12.5 Implementation

#### ToolBase(object)

Tools can have a graphical representation as the SubplotTool or not even be present in the Toolbar as Quit

The ToolBase has the following class attributes for configuration at definition time

- keymap = None: Key(s) to be used to trigger the tool
- description = "": Small description of the tool
- image = None: Image that is used in the toolbar

#### **The following instance attributes are set at instantiation:**

- name
- navigation

#### **Methods**

- trigger(self, event): This is the main method of the Tool, it is called when the Tool is triggered by: \* Toolbar button click \* keypress associated with the Tool Keymap \* Call to navigation.trigger\_tool(name)
- set\_figure(self, figure): Set the figure and navigation attributes
- destroy(self, \*args): Destroy the Tool graphical interface (if exists)

#### **Available Tools**

- ToolQuit
- ToolEnableAllNavigation
- ToolEnableNavigation
- ToolToggleGrid
- ToolToggleFullScreen
- ToolToggleYScale
- ToolToggleXScale

- ToolHome
- ToolBack
- ToolForward
- SaveFigureBase
- ConfigureSubplotsBase

### ToolToggleBase(ToolBase)

The `ToolToggleBase` has the following class attributes for configuration at definition time

- `radio_group = None`: Attribute to group 'radio' like tools (mutually exclusive)
- `cursor = None`: Cursor to use when the tool is active

The **Toggleable** Tools, can capture keypress, mouse moves, and mouse button press

#### It defines the following methods

- `enable(self, event)`: Called by `ToolToggleBase.trigger` method
- `disable(self, event)`: Called when the tool is untoggled
- `toggled` : **Property** True or False

#### Available Tools

- ToolZoom
- ToolPan

### NavigationBase

#### Defines the following attributes

- `canvas`:
- **keypresslock**: Lock to know if the `canvas key_press_event` is available and process it
- `messagelock`: Lock to know if the message is available to write

#### Public methods for User use:

- `nav_connect(self, s, func)`: Connect to to navigation for events
- `nav_disconnect(self, cid)`: Disconnect from navigation event
- `message_event(self, message, sender=None)`: Emit a `tool_message_event` event
- `active_toggle(self)`: **Property** The currently toggled tools or None
- `get_tool_keymap(self, name)`: Return a list of keys that are associated with the tool
- `set_tool_keymap(self, name, *keys)`: Set the keys for the given tool
- `remove_tool(self, name)`: Removes tool from the navigation control.
- `add_tools(self, tools)`: Add multiple tools to `Navigation`
- `add_tool(self, name, tool, group=None, position=None)`: Add a tool to the `Navigation`

- `tool_trigger_event(self, name, sender=None, canvasevent=None, data=None)`: Trigger a tool and fire the event
- `tools(self)` **Property**: Return a dict with available tools with corresponding keymaps, descriptions and objects
- `get_tool(self, name)`: Return the tool object

## ToolbarBase

### Methods for Backend implementation

- `add_toolitem(self, name, group, position, image, description, toggle)`: Add a toolitem to the toolbar. This method is a callback from `tool_added_event` (emitted by navigation)
- `set_message(self, s)`: Display a message on toolbar or in status bar
- `toggle_toolitem(self, name)`: Toggle the toolitem without firing event.
- `remove_toolitem(self, name)`: Remove a toolitem from the Toolbar

### 37.12.6 Backward compatibility

For backward compatibility added a 'navigation' key to `rcsetup.validate_toolbar`, that is used for Navigation classes instantiation instead of the `NavigationToolbar` classes

With this parameter, it makes it transparent to anyone using the existing backends.

[@pelson comment: This also gives us an opportunity to avoid needing to implement all of this in the same PR - some backends can potentially exist without the new functionality for a short while (but it must be done at some point).]

## 37.13 MEP23: Multiple Figures per GUI window

- *Detailed description*
- *Implementation*
  - *FigureManagerBase*
  - *new\_figure\_manager*
  - *new\_figure\_manager\_given\_figure*
  - *NavigationBase*
- *Backward compatibility*
- *Alternatives*

### 37.13.1 Status

#### Discussion

### 37.13.2 Branches and Pull requests

**Previous work** - <https://github.com/matplotlib/matplotlib/pull/2465> **To-delete**

### 37.13.3 Abstract

Add the possibility to have multiple figures grouped under the same `FigureManager`

### 37.13.4 Detailed description

Under the current structure, every canvas has its own window.

This is and may continue to be the desired method of operation for most use cases.

Sometimes when there are too many figures open at the same time, it is desirable to be able to group these under the same window [see](<https://github.com/matplotlib/matplotlib/issues/2194>).

The proposed solution modifies `FigureManagerBase` to contain and manage more than one canvas. The settings parameter `rcParams["backend.multifigure"]` control when the **MultiFigure** behaviour is desired.

#### Note

It is important to note, that the proposed solution, assumes that the [MEP22](<https://github.com/matplotlib/matplotlib/wiki/Mep22>) is already in place. This is simply because the actual implementation of the `Toolbar` makes it pretty hard to switch between canvases.

### 37.13.5 Implementation

The first implementation will be done in GTK3 using a Notebook as canvas container.

#### `FigureManagerBase`

will add the following new methods

- `add_canvas`: To add a canvas to an existing `FigureManager` object
- `remove_canvas`: To remove a canvas from a `FigureManager` object, if it is the last one, it will be destroyed
- `move_canvas`: To move a canvas from one `FigureManager` to another.
- `set_canvas_title`: To change the title associated with a specific canvas container
- `get_canvas_title`: To get the title associated with a specific canvas container
- `get_active_canvas`: To get the canvas that is in the foreground and is subject to the gui events. There is no `set_active_canvas` because the active canvas, is defined when `show` is called on a `Canvas` object.

`new_figure_manager`

To control which `FigureManager` will contain the new figures, an extra optional parameter `figuremanager` will be added, this parameter value will be passed to `new_figure_manager_given_figure`

`new_figure_manager_given_figure`

- If `figuremanager` parameter is give, this `FigureManager` object will be used instead of creating a new one.
- If `rcParams['backend.multifigure'] == True`: The last `FigureManager` object will be used instead of creating a new one.

`NavigationBase`

Modifies the `NavigationBase` to keep a list of canvases, directing the actions to the active one

### 37.13.6 Backward compatibility

For the **MultiFigure** properties to be visible, the user has to activate them directly setting `rcParams['backend.multifigure'] = True`

It should be backwards compatible for backends that adhere to the current `FigureManagerBase` structure even if they have not implemented the **MultiFigure** magic yet.

### 37.13.7 Alternatives

Insted of modifying the `FigureManagerBase` it could be possible to add a parallel class, that handles the cases where `rcParams['backend.multifigure'] = True`. This will warranty that there won't be any problems with custom made backends, but also makes bigger the code, and more things to maintain.

## 37.14 MEP24: negative radius in polar plots

### 37.14.2 Branches and Pull requests

None

### 37.14.3 Abstract

It is clear that polar plots need to be able to gracefully handle negative  $r$  values (not by clipping or reflection).

### 37.14.4 Detailed description

One obvious application that we should support is bB plots (see <https://github.com/matplotlib/matplotlib/issues/1730#issuecomment-40815837>), but this seems more generally useful (for example growth rate as a function of angle). The assumption in the current code (as I understand it) is that the center of the graph is  $r=0$ , however it would be good to be able to set the center to be at any  $r$  (with any value less than the off set clipped).

### 37.15.1 Status

#### Discussion

### 37.15.2 Branches and Pull requests

- development branches:
- related pull requests:

### 37.15.3 Abstract

This MEP aims at adding a serializable `Controller` objects to act as an `Artist` managers. Users would then communicate changes to an `Artist` via a `Controller`. In this way, functionality of the `Controller` objects may be added incrementally since each `Artist` is still responsible for drawing everything. The goal is to create an API that is usable both by graphing libraries requiring high-level descriptions of figures and libraries requiring low-level interpretations.

### 37.15.4 Detailed description

Matplotlib is a core plotting engine with an API that many users already understand. It's difficult/impossible for other graphing libraries to (1) get a complete figure description, (2) output raw data from the figure object as the user has provided it, (3) understand the semantics of the figure objects without heuristics, and (4) give matplotlib a complete figure description to visualize. In addition, because an `Artist` has no conception of its own semantics within the figure, it's difficult to interact with them in a natural way.

In this sense, matplotlib will adopt a standard Model-View-Controller (MVC) framework. The *Model* will be the user defined data, style, and semantics. The *Views* are the ensemble of each individual `Artist`, which are responsible for producing the final image based on the *model*. The *Controller* will be the `Controller` object managing its set of `Artist` objects.

The `Controller` must be able to export the information that it's carrying about the figure on command, perhaps via a `to_json` method or similar. Because it would be extremely extraneous to duplicate all of the information in the model with the controller, only user-specified information (data + style) are explicitly kept. If a user wants more information (defaults) from the view/model, it should be able to query for it.

- This might be annoying to do, non-specified kwargs are pulled from the `rcParams` object which is in turn created from reading a user specified file and can be dynamically changed at run time. I suppose we could keep a dict of default defaults and compare against that. Not clear how this will interact with the style sheet [[MEP26]] - @tacaswell

Additional Notes:

- The raw data does not necessarily need to be a `list`, `ndarray`, etc. Rather, it can more abstractly just have a method to yield data when needed.

- Because the `Controller` will contain extra information that users may not want to keep around, it should *not* be created by default. You should be able to both (a) instantiate a `Controller` with a figure and (b) build a figure with a `Controller`.

Use Cases:

- Export all necessary informat
- Serializing a matplotlib figure, saving it, and being able to rerun later.
- Any other source sending an appropriately formatted representation to matplotlib to open

### 37.15.5 Examples

Here are some examples of what the controllers should be able to do.

1. Instantiate a matplotlib figure from a serialized representation (e.g., JSON):

```
import json
from matplotlib.controllers import Controller
with open('my_figure') as f:
    o = json.load(f)
c = Controller(o)
fig = c.figure
```

2. Manage artists from the controller (e.g., `Line2D`):

```
# not really sure how this should look
c.axes[0].lines[0].color = 'b'
# ?
```

3. Export serializable figure representation:

```
o = c.to_json()
# or... we should be able to throw a figure object in there too
o = Controller.to_json(mpl_fig)
```

### 37.15.6 Implementation

1. Create base `Controller` objects that are able to manage `Artist` objects (e.g., `Hist`)

Comments:

- initialization should happen via unpacking `**`, so we need a copy of call signature parameter for the `Artist` we're ultimately trying to control. Unfortunate hard-coded repetition...
- should the additional `**kwargs` accepted by each `Artist` be tracked at the `Controller`
- how does a `Controller` know which artist belongs where? E.g., do we need to pass axes references?

Progress:

- A simple NB demonstrating some functionality for `Line2DController` objects: <https://nbviewer.jupyter.org/gist/theengineear/f0aa8d79f64325e767c0>

2. Write in protocols for the `Controller` to *update* the model.

Comments:

- how should containers be dealt with? E.g., what happens to old patches when we re-bin a histogram?
- in the link from (1), the old line is completely destroyed and redrawn, what if something is referencing it?

3. Create method by which a json object can be assembled from the `Controllers`

4. Deal with serializing the unserializable aspects of a figure (e.g., non-affine transforms?)

5. Be able to instantiate from a serialized representation

6. Reimplement the existing `pyplot` and `Axes` method, e.g. `pyplot.hist` and `Axes.hist` in terms of the new controller class.

> @theengineer: in #2 above, what do you mean by *get updates* from each `Artist`?

^ Yup. The `Controller` *shouldn't* need to get updated. This just happens in #3. Delete comments when you see this.

### 37.15.7 Backward compatibility

- pickling will change
- non-affine transformations will require a defined pickling method

### 37.15.8 Alternatives

PR #3150 suggested adding semantics by parasitically attaching extra containers to axes objects. This is a more complete solution with what should be a more developed/flexible/powerful framework.

### 37.16.1 Status

#### Rejected

### 37.16.2 Branches and Pull requests

### 37.16.3 Abstract

This MEP proposes a new stylesheet implementation to allow more comprehensive and dynamic styling of artists.

The current version of matplotlib (1.4.0) allows stylesheets based on the rcParams syntax to be applied before creation of a plot. The methodology below proposes a new syntax, based on CSS, which would allow styling of individual artists and properties, which can be applied dynamically to existing objects.

This is related to (and makes steps toward) the overall goal of moving to a DOM/tree-like architecture.

### 37.16.4 Detailed description

Currently, the look and appearance of existing artist objects (figure, axes, Line2D etc...) can only be updated via `set_` and `get_` methods on the artist object, which is quite laborious, especially if no reference to the artist(s) has been stored. The new style sheets introduced in 1.4 allow styling before a plot is created, but do not offer any means to dynamically update plots or distinguish between artists of the same type (i.e. to specify the `line color` and `line style` separately for differing `Line2D` objects).

The initial development should concentrate on allowing styling of artist primitives (those artists that do not contain other artists), and further development could expand the CSS syntax rules and parser to allow more complex styling. See the appendix for a list of primitives.

The new methodology would require development of a number of steps:

- A new stylesheet syntax (likely based on CSS) to allow selection of artists by type, class, id etc...

- A mechanism by which to parse a stylesheet into a tree
- A mechanism by which to translate the parse-tree into something which can be used to update the properties of relevant artists. Ideally this would implement a method by which to traverse the artists in a tree-like structure.
- A mechanism by which to generate a stylesheet from existing artist properties. This would be useful to allow a user to export a stylesheet from an existing figure (where the appearance may have been set using the matplotlib API)...

### 37.16.5 Implementation

It will be easiest to allow a '3rd party' to modify/set the style of an artist if the 'style' is created as a separate class and store against the artist as a property. The `GraphicsContext` class already provides a the basis of a `Style` class and an artists `draw` method can be refactored to use the `Style` class rather than setting up it's own `GraphicsContext` and transferring it's style-related properties to it. A minimal example of how this could be implemented is shown here: [https://github.com/JamesRamm/mpl\\_experiment](https://github.com/JamesRamm/mpl_experiment)

IMO, this will also make the API and code base much neater as individual get/set methods for artist style properties are now redundant... Indirectly related would be a general drive to replace get/set methods with properties. Implementing the style class with properties would be a big stride toward this...

For initial development, I suggest developing a syntax based on a much (much much) simplified version of CSS. I am in favour of dubbing this Artist Style Sheets :+1: :

#### BNF Grammar

I propose a very simple syntax to implement initially (like a proof of concept), which can be expanded upon in the future. The BNF form of the syntax is given below and then explained

```
RuleSet ::= SelectorSequence "{"Declaration"}"
SelectorSequence ::= Selector {"," Selector}
Declaration ::= propName":" propValue";"
Selector ::= ArtistIdent{"#"Ident}
propName ::= Ident
propValue ::= Ident | Number | Colour | "None"
```

`ArtistIdent`, `Ident`, `Number` and `Colour` are tokens (the basic building blocks of the expression) which are defined by regular expressions.

#### Syntax

A CSS stylesheet consists of a series of **rule sets** in hierarchical order (rules are applied from top to bottom). Each rule follows the syntax

```
selector {attribute: value;}
```

Each rule can have any number of attribute: value pairs, and a stylesheet can have any number of rules.

The initial syntax is designed only for artist primitives. It does not address the question of how to set properties on container types (whose properties may themselves be artists with settable properties), however, a future solution to this could simply be nested RuleSet s

## Selectors

Selectors define the object to which the attribute updates should be applied. As a starting point, I propose just 2 selectors to use in initial development:

### Artist Type Selector

Select an artist by it's type. E.g Line2D or Text:

```
Line2D {attribute: value}
```

The regex for matching the artist type selector (ArtistIdent in the BNF grammar) would be:

```
ArtistIdent = r'(?P<ArtistIdent>\bLine2D\b|\bText\b|\bAxesImage\b|\bFigureImage\b|\bPatch\b)'
```

### GID selector

Select an artist by its gid:

```
Line2D#myGID {attribute: value}
```

A gid can be any string, so the regex could be as follows:

```
Ident = r'(?P<Ident>[a-zA-Z_][a-zA-Z_0-9]*)'
```

The above selectors roughly correspond to their CSS counterparts (<http://www.w3.org/TR/CSS21/selectors.html>)

## Attributes and values

- Attributes are any valid (settable) property for the artist in question.
- Values are any valid value for the property (Usually a string, or number).

## Parsing

Parsing would consist of breaking the stylesheet into tokens (the python cookbook gives a nice tokenizing recipe on page 66), applying the syntax rules and constructing a Tree. This requires defining the grammar of the stylesheet (again, we can borrow from CSS) and writing a parser. Happily, there is a recipe for this in the python cookbook aswell.

### Visitor pattern for matplotlib figure

In order to apply the stylesheet rules to the relevant artists, we need to 'visit' each artist in a figure and apply the relevant rule. Here is a visitor class (again, thanks to python cookbook), where each node would be an artist in the figure. A `visit_` method would need to be implemented for each mpl artist, to handle the different properties for each

```
class Visitor:
    def visit(self, node):
        name = 'visit_' + type(node).__name__
        meth = getattr(self, name, None)
        if meth is None:
            raise NotImplementedError
        return meth(node)
```

An evaluator class would then take the stylesheet rules and implement the visitor on each one of them.

### 37.16.6 Backward compatibility

Implementing a separate `Style` class would break backward compatibility as many get/set methods on an artist would become redundant. While it would be possible to alter these methods to hook into the `Style` class (stored as a property against the artist), I would be in favor of simply removing them to both neaten/simplify the codebase and to provide a simple, uncluttered API...

### 37.16.7 Alternatives

No alternatives, but some of the ground covered here overlaps with MEP25, which may assist in this development

### 37.16.8 Appendix

#### Matplotlib primitives

This will form the initial selectors which stylesheets can use.

- Line2D
- Text
- AxesImage
- FigureImage
- Patch

## 37.17 MEP27: decouple pyplot from backends

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Future compatibility*
- *Backward compatibility*
- *Alternatives*
- *Questions*

### 37.17.1 Status

#### Progress

### 37.17.2 Branches and Pull requests

Main PR (including GTK3): + <https://github.com/matplotlib/matplotlib/pull/4143>

Backend specific branch diffs: + <https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-tkagg> + <https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-qt> + <https://github.com/OceanWolf/matplotlib/compare/backend-refactor...backend-refactor-wx>

### 37.17.3 Abstract

This MEP refactors the backends to give a more structured and consistent API, removing generic code and consolidate existing code. To do this we propose splitting:

1. `FigureManagerBase` and its derived classes into the core functionality class `FigureManager` and a backend specific class `WindowBase` and
2. `ShowBase` and its derived classes into `Gcf.show_all` and `MainLoopBase`.

### 37.17.4 Detailed description

This MEP aims to consolidate the backends API into one single uniform API, removing generic code out of the backend (which includes `_pylab_helpers` and `Gcf`), and push code to a more appropriate level in `matplotlib`. With this we automatically remove inconsistencies that appear in the backends, such as `FigureManagerBase.resize(w, h)` which sometimes sets the canvas, and other times set the entire window to the dimensions given, depending on the backend.

Two main places for generic code appear in the classes derived from `FigureManagerBase` and `ShowBase`.

1. `FigureManagerBase` has **three** jobs at the moment:

- (a) The documentation describes it as a *“Helper class for pyplot mode, wraps everything up into a neat bundle”*
  - (b) But it doesn't just wrap the canvas and toolbar, it also does all of the windowing tasks itself. The conflation of these two tasks gets seen the best in the following line: ``python self.set_window_title("Figure %d" % num) `` This combines backend specific code `self.set_window_title(title)` with matplotlib generic code `title = "Figure %d" % num.`
  - (c) Currently the backend specific subclass of `FigureManager` decides when to end the mainloop. This also seems very wrong as the figure should have no control over the other figures.
2. `ShowBase` has two jobs:
- (a) It has the job of going through all figure managers registered in `_pylab_helpers.Gcf` and telling them to show themselves.
  - (b) And secondly it has the job of performing the backend specific `mainloop` to block the main programme and thus keep the figures from dying.

### 37.17.5 Implementation

The description of this MEP gives us most of the solution:

1. To remove the windowing aspect out of `FigureManagerBase` letting it simply wrap this new class along with the other backend classes. Create a new `WindowBase` class that can handle this functionality, with pass-through methods (`:arrow_right:`) to `WindowBase`. Classes that subclass `WindowBase` should also subclass the GUI specific window class to ensure backward compatibility (`manager.window == manager.window`).
2. Refactor the mainloop of `ShowBase` into `MainLoopBase`, which encapsulates the end of the loop as well. We give an instance of `MainLoop` to `FigureManager` as a key unlock the exit method (requiring all keys returned before the loop can die). Note this opens the possibility for multiple backends to run concurrently.
3. Now that `FigureManagerBase` has no backend specifics in it, to rename it to `FigureManager`, and move to a new file `backend_managers.py` noting that:
  - (a) This allows us to break up the conversion of backends into separate PRs as we can keep the existing `FigureManagerBase` class and its dependencies intact.
  - (b) and this also anticipates MEP22 where the new `NavigationBase` has morphed into a backend independent `ToolManager`.

FigureManager-Base(canvas, num)	FigureManager(figure, num)	WindowBase(title)	Notes
show		show	
destroy	calls destroy on all components	destroy	
full_screen_toggle	handles logic	set_fullscreen	
resize		resize	
key_press	key_press		
get_window_title		get_window_title	
set_window_title		set_window_title	
	_get_toolbar		A common method to all subclasses of FigureManagerBase
		set_default_size	
		add_element_to_window	

ShowBase	MainLoop-Base	Notes
main-loop	begin	
	end	Gets called automatically when no more instances of the subclass exist
__call__		Method moved to Gcf.show_all

### 37.17.6 Future compatibility

As eluded to above when discussing MEP 22, this refactor makes it easy to add in new generic features. At the moment, MEP 22 has to make ugly hacks to each class extending from `FigureManagerBase`. With this code, this only needs to get made in the single `FigureManager` class. This also makes the later deprecation of `NavigationToolbar2` very straightforward, only needing to touch the single `FigureManager` class

MEP 23 makes for another use case where this refactored code will come in very handy.

### 37.17.7 Backward compatibility

As we leave all backend code intact, only adding missing methods to existing classes, this should work seamlessly for all use cases. The only difference will lie for backends that used `FigureManager.resize` to resize the canvas and not the window, due to the standardisation of the API.

I would envision that the classes made obsolete by this refactor get deprecated and removed on the same timetable as `NavigationToolbar2`, also note that the change in call signature to the `FigureCanvasWx` constructor, while backward compatible, I think the old (imho ugly style) signature should get deprecated and removed in the same manner as everything else.

back-end	manager.resize(w,h)	Extra
gtk3	window	
Tk	canvas	
Qt	window	
Wx	canvas	FigureManagerWx had <code>frame</code> as an alias to <code>window</code> , so this also breaks BC.

### 37.17.8 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

### 37.17.9 Questions

Mdehoon: Can you elaborate on how to run multiple backends concurrently?

OceanWolf: @mdehoon, as I say, not for this MEP, but I see this MEP opens it up as a future possibility. Basically the `MainLoopBase` class acts a per backend Gcf, in this MEP it tracks the number of figures open per backend, and manages the mainloops for those backends. It closes the backend specific mainloop when it detects that no figures remain open for that backend. Because of this I imagine that with only a small amount of tweaking that we can do full-multi-backend matplotlib. No idea yet why one would want to, but I leave the possibility there in `MainLoopBase`. With all the backend-code specifics refactored out of `FigureManager` also aids in this, one manager to rule them (the backends) all.

Mdehoon: @OceanWolf, OK, thanks for the explanation. Having a uniform API for the backends is very important for the maintainability of matplotlib. I think this MEP is a step in the right direction.

### 37.18.1 Status

#### Discussion

### 37.18.2 Branches and Pull requests

The following lists any open PRs or branches related to this MEP:

1. Deprecate redundant statistical kwargs in `Axes.boxplot`: <https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations>
2. Deprecate redundant style options in `Axes.boxplot`: <https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations>
3. Deprecate passings 2D numpy arrays as input: None
4. Add pre- & post-processing options to `cbook.boxplot_stats`: <https://github.com/phobson/matplotlib/tree/boxplot-stat-transforms>
5. Exposing `cbook.boxplot_stats` through `Axes.boxplot` kwargs: None
6. Remove redundant statistical kwargs in `Axes.boxplot`: None
7. Remove redundant style options in `Axes.boxplot`: None
8. Remaining items that arise through discussion: None

### 37.18.3 Abstract

Over the past few releases, the `Axes.boxplot` method has grown in complexity to support fully customizable artist styling and statistical computation. This lead to `Axes.boxplot` being split off into multiple parts. The statistics needed to draw a boxplot are computed in `cbook.boxplot_stats`, while the actual artists are drawn by `Axes.bxp`. The original method, `Axes.boxplot` remains as the most public API that handles passing the user-supplied data to `cbook.boxplot_stats`, feeding the results to `Axes.bxp`, and pre-processing style information for each facet of the boxplot plots.

This MEP will outline a path forward to rollback the added complexity and simplify the API while maintaining reasonable backwards compatibility.

### 37.18.4 Detailed description

Currently, the `Axes.boxplot` method accepts parameters that allow the users to specify medians and confidence intervals for each box that will be drawn in the plot. These were provided so that advanced users could provide statistics computed in a different fashion than the simple method provided by matplotlib. However, handling this input requires complex logic to make sure that the forms of the data structure match what needs to be drawn. At the moment, that logic contains 9 separate if/else statements nested up to 5 levels deep with a for loop, and may raise up to 2 errors. These parameters were added prior to the creation of the `Axes.bxp` method, which draws boxplots from a list of dictionaries containing the relevant statistics. Matplotlib also provides a function that computes these statistics via `cbook.boxplot_stats`. Note that advanced users can now either a) write their own function to compute the stats required by `Axes.bxp`, or b) modify the output returned by `cbook.boxplots_stats` to fully customize the position of the artists of the plots. With this flexibility, the parameters to manually specify only the medians and their confidence intervals remain for backwards compatibility.

Around the same time that the two roles of `Axes.boxplot` were split into `cbook.boxplot_stats` for computation and `Axes.bxp` for drawing, both `Axes.boxplot` and `Axes.bxp` were written to accept parameters that individually toggle the drawing of all components of the boxplots, and parameters that individually configure the style of those artists. However, to maintain backwards compatibility, the `sym` parameter (previously used to specify the symbol of the fliers) was retained. This parameter itself requires fairly complex logic to reconcile the `sym` parameters with the newer `flierprops` parameter at the default style specified by `matplotlibrc`.

This MEP seeks to dramatically simplify the creation of boxplots for novice and advanced users alike. Importantly, the changes proposed here will also be available to downstream packages like seaborn, as seaborn smartly allows users to pass arbitrary dictionaries of parameters through the seaborn API to the underlying matplotlib functions.

This will be achieved in the following way:

1. `cbook.boxplot_stats` will be modified to allow pre- and post- computation transformation functions to be passed in (e.g., `np.log` and `np.exp` for lognormally distributed data)
2. `Axes.boxplot` will be modified to also accept and naïvely pass them to `cbook.boxplots_stats` (Alt: pass the stat function and a dict of its optional parameters).
3. Outdated parameters from `Axes.boxplot` will be deprecated and later removed.

#### Importance

Since the limits of the whiskers are computed arithmetically, there is an implicit assumption of normality in box and whisker plots. This primarily affects which data points are classified as outliers.

Allowing transformations to the data and the results used to draw boxplots will allow users to opt-out of that assumption if the data are known to not fit a normal distribution.

Below is an example of how `Axes.boxplot` classifies outliers of lognormal data differently depending on these types of transforms.

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cbook
np.random.seed(0)

fig, ax = plt.subplots(figsize=(4, 6))
```

(continues on next page)

(continued from previous page)

```
ax.set_yscale('log')
data = np.random.lognormal(-1.75, 2.75, size=37)

stats = cbook.boxplot_stats(data, labels=['arithmetic'])
logstats = cbook.boxplot_stats(np.log(data), labels=['log-transformed'])

for lsdict in logstats:
    for key, value in lsdict.items():
        if key != 'label':
            lsdict[key] = np.exp(value)

stats.extend(logstats)
ax.bxp(stats)
fig.show()
```

### 37.18.5 Implementation

#### Passing transform functions to `cbook.boxplots_stats`

This MEP proposes that two parameters (e.g., `transform_in` and `transform_out`) be added to the `cookbook` function that computes the statistics for the `boxplot` function. These will be optional keyword-only arguments and can easily be set to `lambda x: x` as a no-op when omitted by the user. The `transform_in` function will be applied to the data as the `boxplot_stats` function loops through each subset of the data passed to it. After the list of statistics dictionaries are computed the `transform_out` function is applied to each value in the dictionaries.

These transformations can then be added to the call signature of `Axes.boxplot` with little impact to that method's complexity. This is because they can be directly passed to `cbook.boxplot_stats`. Alternatively, `Axes.boxplot` could be modified to accept an optional statistical function kwarg and a dictionary of parameters to be directly passed to it.

At this point in the implementation users and external libraries like `seaborn` would have complete control via the `Axes.boxplot` method. More importantly, at the very least, `seaborn` would require no changes to its API to allow users to take advantage of these new options.

#### Simplifications to the `Axes.boxplot` API and other functions

Simplifying the `boxplot` method consists primarily of deprecating and then removing the redundant parameters. Optionally, a next step would include rectifying minor terminological inconsistencies between `Axes.boxplot` and `Axes.bxp`.

The parameters to be deprecated and removed include:

1. `usermedians` - processed by 10 SLOC, 3 if blocks, a for loop
2. `conf_intervals` - handled by 15 SLOC, 6 if blocks, a for loop
3. `sym` - processed by 12 SLOC, 4 if blocks

Removing the `sym` option allows all code in handling the remaining styling parameters to be moved to `Axes.bxp`. This doesn't remove any complexity, but does reinforce the single responsibility principle among `Axes.bxp`, `cbook.boxplot_stats`, and `Axes.boxplot`.

Additionally, the `notch` parameter could be renamed `shownotches` to be consistent with `Axes.bxp`. This kind of cleanup could be taken a step further and the `whis`, `bootstrap`, `autorange` could be rolled into the kwargs passed to the new `statfxn` parameter.

### 37.18.6 Backward compatibility

Implementation of this MEP would eventually result in the backwards incompatible deprecation and then removal of the keyword parameters `usermedians`, `conf_intervals`, and `sym`. Curiosity searches on GitHub indicated that `usermedians`, `conf_intervals` are used by few users, who all seem to have a very strong knowledge of `matplotlib`. A robust deprecation cycle should provide sufficient time for these users to migrate to a new API.

Deprecation of `sym` however, may have a much broader reach into the `matplotlib` userbase.

#### Schedule

An accelerated timeline could look like the following:

1. v2.0.1 add transforms to `cbook.boxplots_stats`, expose in `Axes.boxplot`
2. v2.1.0 Initial Deprecations , and using 2D numpy arrays as input
  - (a) Using 2D numpy arrays as input. The semantics around 2D arrays are generally confusing.
  - (b) `usermedians`, `conf_intervals`, `sym` parameters
3. v2.2.0
  - (a) remove `usermedians`, `conf_intervals`, `sym` parameters
  - (b) deprecate `notch` in favor of `shownotches` to be consistent with other parameters and `Axes.bxp`
4. **v2.3.0**
  - (a) remove `notch` parameter
  - (b) move all style and artist toggling logic to `Axes.bxp` such `Axes.boxplot` is little more than a broker between `Axes.bxp` and `cbook.boxplots_stats`

### Anticipated Impacts to Users

As described above deprecating `usermedians` and `conf_intervals` will likely impact few users. Those who will be impacted are almost certainly advanced users who will be able to adapt to the change.

Deprecating the `sym` option may import more users and effort should be taken to collect community feedback on this.

### Anticipated Impacts to Downstream Libraries

The source code (GitHub master as of 2016-10-17) was inspected for `seaborn` and `python-ggplot` to see if these changes would impact their use. None of the parameters nominated for removal in this MEP are used by `seaborn`. The `seaborn` APIs that use `matplotlib`'s `boxplot` function allow user's to pass arbitrary `**kwargs` through to `matplotlib`'s API. Thus `seaborn` users with modern `matplotlib` installations will be able to take full advantage of any new features added as a result of this MEP.

`Python-ggplot` has implemented its own function to draw boxplots. Therefore, no impact can come to it as a result of implementing this MEP.

## 37.18.7 Alternatives

### Variations on the theme

This MEP can be divided into a few loosely coupled components:

1. Allowing pre- and post-computation transformation function in `cbook.boxplot_stats`
2. Exposing that transformation in the `Axes.boxplot` API
3. Removing redundant statistical options in `Axes.boxplot`
4. Shifting all styling parameter processing from `Axes.boxplot` to `Axes.bxp`.

With this approach, #2 depends on #1, and #4 depends on #3.

There are two possible approaches to #2. The first and most direct would be to mirror the new `transform_in` and `transform_out` parameters of `cbook.boxplot_stats` in `Axes.boxplot` and pass them directly.

The second approach would be to add `statfxn` and `statfxn_args` parameters to `Axes.boxplot`. Under this implementation, the default value of `statfxn` would be `cbook.boxplot_stats`, but users could pass their own function. Then `transform_in` and `transform_out` would then be passed as elements of the `statfxn_args` parameter.

```
def boxplot_stats(data, ..., transform_in=None, transform_out=None):
    if transform_in is None:
        transform_in = lambda x: x

    if transform_out is None:
        transform_out = lambda x: x

    output = []
    for _d in data:
        d = transform_in(_d)
        stat_dict = do_stats(d)
        for key, value in stat_dict.item():
            if key != 'label':
                stat_dict[key] = transform_out(value)
        output.append(d)
    return output

class Axes(...):
    def boxplot_option1(data, ..., transform_in=None, transform_out=None):
        stats = cbook.boxplot_stats(data, ...,
                                   transform_in=transform_in,
                                   transform_out=transform_out)
        return self.bxp(stats, ...)

    def boxplot_option2(data, ..., statfxn=None, **statopts):
        if statfxn is None:
            statfxn = boxplot_stats
        stats = statfxn(data, **statopts)
        return self.bxp(stats, ...)
```

Both cases would allow users to do the following:

```
fig, ax1 = plt.subplots()
artists1 = ax1.boxplot_optionX(data, transform_in=np.log,
                              transform_out=np.exp)
```

But Option Two lets a user write a completely custom stat function (e.g., `my_box_stats`) with fancy BCA confidence intervals and the whiskers set differently depending on some attribute of the data.

This is available under the current API:

```
fig, ax1 = plt.subplots()
my_stats = my_box_stats(data, bootstrap_method='BCA',
                       whisker_method='dynamic')
ax1.bxp(my_stats)
```

And would be more concise with Option Two

```
fig, ax = plt.subplots()
statopts = dict(transform_in=np.log, transform_out=np.exp)
ax.boxplot(data, ..., **statopts)
```

Users could also pass their own function to compute the stats:

```
fig, ax1 = plt.subplots()
ax1.boxplot(data, statfxn=my_box_stats, bootstrap_method='BCA',
            whisker_method='dynamic')
```

From the examples above, Option Two seems to have only marginal benefit, but in the context of downstream libraries like seaborn, its advantage is more apparent as the following would be possible without any patches to seaborn:

```
import seaborn
tips = seaborn.load_data('tips')
g = seaborn.factorplot(x="day", y="total_bill", hue="sex", data=tips,
                      kind='box', palette="PRGn", shownotches=True,
                      statfxn=my_box_stats, bootstrap_method='BCA',
                      whisker_method='dynamic')
```

This type of flexibility was the intention behind splitting the overall boxplot API in the current three functions. In practice however, downstream libraries like seaborn support versions of matplotlib dating back well before the split. Thus, adding just a bit more flexibility to the `Axes.boxplot` could expose all the functionality to users of the downstream libraries with modern matplotlib installation without intervention from the downstream library maintainers.

### Doing less

Another obvious alternative would be to omit the added pre- and post- computation transform functionality in `cbook.boxplot_stats` and `Axes.boxplot`, and simply remove the redundant statistical and style parameters as described above.

### Doing nothing

As with many things in life, doing nothing is an option here. This means we simply advocate for users and downstream libraries to take advantage of the split between `cbook.boxplot_stats` and `Axes.bxp` and let them decide how to provide an interface to that.

## 37.19 MEP29: Text light markup

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*

- *Implementation*
  - *Improvements*
  - *Problems*
- *Backward compatibility*
- *Alternatives*

### 37.19.1 Status

Discussion

### 37.19.2 Branches and Pull requests

None at the moment, proof of concept only.

### 37.19.3 Abstract

This MEP proposes to add lightweight markup to the text artist.

### 37.19.4 Detailed description

Using different size/color/family in a text annotation is difficult because the `text` method accepts argument for size/color/family/weight/etc. that are used for the whole text. But, if one wants, for example, to have different colors, one has to look at the gallery where one such example is provided: [http://matplotlib.org/examples/text\\_labels\\_and\\_annotations/rainbow\\_text.html](http://matplotlib.org/examples/text_labels_and_annotations/rainbow_text.html)

This example takes a list of strings as well as a list of colors which makes it cumbersome to use. An alternative would be to use a restricted set of pango-like markup (see <https://developer.gnome.org/pango/stable/PangoMarkupFormat.html>) and to interpret this markup.

Some markup examples:

```
Hello <b>world!</b>`  
Hello <span color="blue">world!</span>
```

### 37.19.5 Implementation

A proof of concept is provided in `markup_example.py` but it currently only handles the horizontal direction.

#### Improvements

- This proof of concept uses regex to parse the text but it may be better to use the `html.parser` from the standard library.

- Computation of text fragment positions could benefit from the `OffsetFrom` class. See for example item 5 in [Using Complex Coordinates with Annotations](#)

### Problems

- One serious problem is how to deal with text having both latex and html-like tags. For example, consider the following:

```
<b>Bold</b>
```

Recommendation would be to have mutual exclusion.

### 37.19.6 Backward compatibility

None at the moment since it is only a proof of concept

### 37.19.7 Alternatives

As proposed by @anntzer, this could be also implemented as improvements to `mathtext`. For example:

```
r"${\text{Hello \textbf{world}}}$"  
r"${\text{Hello \textcolor{blue}{world}}}$"  
r"${\text{Hello \textsf{\small world}}}$"
```

## LICENSES

Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative [licenses page](#) for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

### 38.1 Why BSD compatible?

The two dominant license variants in the wild are GPL-style and BSD-style. There are countless other licenses that place specific restrictions on code reuse, but there is an important difference to be considered in the GPL and BSD variants. The best known and perhaps most widely used license is the GPL, which in addition to granting you full rights to the source code including redistribution, carries with it an extra obligation. If you use GPL code in your own code, or link with it, your product must be released under a GPL compatible license. i.e., you are required to give the source code to other people and give them the right to redistribute it as well. Many of the most famous and widely used open source projects are released under the GPL, including linux, gcc, emacs and sage.

The second major class are the BSD-style licenses (which includes MIT and the python PSF license). These basically allow you to do whatever you want with the code: ignore it, include it in your own open source project, include it in your proprietary product, sell it, whatever. python itself is released under a BSD compatible license, in the sense that, quoting from the PSF license page:

There **is** no GPL-like "copyleft" restriction. Distributing binary-only versions of Python, modified **or not**, **is** allowed. There **is** no requirement to release **any** of your source code. You can also write extension modules **for** Python **and** provide them only **in** binary form.

Famous projects released under a BSD-style license in the permissive sense of the last paragraph are the BSD operating system, python and TeX.

There are several reasons why early matplotlib developers selected a BSD compatible license. matplotlib is a python extension, and we choose a license that was based on the python license (BSD compatible). Also, we wanted to attract as many users and developers as possible, and

many software companies will not use GPL code in software they plan to distribute, even those that are highly committed to open source development, such as [enthought](#), out of legitimate concern that use of the GPL will “infect” their code base by its viral nature. In effect, they want to retain the right to release some proprietary code. Companies and institutions who use matplotlib often make significant contributions, because they have the resources to get a job done, even a boring one. Two of the matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.

## DEFAULT COLOR CHANGES

As discussed at length elsewhere [insert links], `jet` is an empirically bad color map and should not be the default color map. Due to the position that changing the appearance of the plot breaks backward compatibility, this change has been put off for far longer than it should have been. In addition to changing the default color map we plan to take the chance to change the default color-cycle on plots and to adopt a different color map for filled plots (`imshow`, `pcolor`, `contourf`, etc) and for scatter like plots.

### 39.1 Default Heat Map Colormap

The choice of a new color map is fertile ground to bike-shedding (“No, it should be `_this_color_`”) so we have a proposed set criteria (via Nathaniel Smith) to evaluate proposed color maps.

- it should be a sequential colormap, because diverging colormaps are really misleading unless you know where the “center” of the data is, and for a default colormap we generally won’t.
- it should be perceptually uniform, i.e., human subjective judgments of how far apart nearby colors are should correspond as linearly as possible to the difference between the numerical values they represent, at least locally.
- it should have a perceptually uniform luminance ramp, i.e. if you convert to greyscale it should still be uniform. This is useful both in practical terms (greyscale printers are still a thing!) and because luminance is a very strong and natural cue to magnitude.
- it should also have some kind of variation in hue, because hue variation is a really helpful additional cue to perception, having two cues is better than one, and there’s no reason not to do it.
- the hue variation should be chosen to produce reasonable results even for viewers with the more common types of colorblindness. (Which rules out things like red-to-green.)
- For bonus points, it would be nice to choose a hue ramp that still works if you throw away the luminance variation, because then we could use the version with varying luminance for 2d plots, and the version with just hue variation for 3d plots. (In 3d plots you really want to reserve the luminance channel for lighting/shading, because your brain is *really* good at extracting 3d shape from luminance variation. If the 3d surface itself has massively varying luminance then this screws up the ability to see shape.)
- Not infringe any existing IP

### 39.1.1 Example script

### 39.1.2 Proposed Colormaps

## 39.2 Default Scatter Colormap

For heat-map like applications it can be desirable to cover as much of the luminance scale as possible, however when color mapping markers, having markers too close to white can be a problem. For that reason we propose using a different (but maybe related) color map to the heat map for marker-based. The design parameters are the same as above, only with a more limited luminance variation.

### 39.2.1 Example script

```
import numpy as np
import matplotlib.pyplot as plt

np.random.seed(1234)

fig, (ax1, ax2) = plt.subplots(1, 2)

N = 50
x = np.random.rand(N)
y = np.random.rand(N)
colors = np.random.rand(N)
area = np.pi * (15 * np.random.rand(N))**2 # 0 to 15 point radiuses

ax1.scatter(x, y, s=area, c=colors, alpha=0.5)

X,Y = np.meshgrid(np.arange(0, 2*np.pi, .2),
                  np.arange(0, 2*np.pi, .2))
U = np.cos(X)
V = np.sin(Y)
Q = ax2.quiver(X, Y, U, V, units='width')
qd = np.random.rand(np.prod(X.shape))
Q.set_array(qd)
```

### 39.2.2 Proposed Colormaps

## 39.3 Color Cycle / Qualitative color map

When plotting lines it is frequently desirable to plot multiple lines or artists which need to be distinguishable, but there is no inherent ordering.

### 39.3.1 Example script

```
import numpy as np
import matplotlib.pyplot as plt

fig, (ax1, ax2) = plt.subplots(1, 2)

x = np.linspace(0, 1, 10)

for j in range(10):
    ax1.plot(x, x * j)

th = np.linspace(0, 2*np.pi, 1024)
for j in np.linspace(0, np.pi, 10):
    ax2.plot(th, np.sin(th + j))

ax2.set_xlim(0, 2*np.pi)
```

### 39.3.2 Proposed Color cycle

**Part VII**

**Glossary**

**AGG** The Anti-Grain Geometry ([Agg](#)) rendering engine, capable of rendering high-quality images

**Cairo** The [Cairo graphics](#) engine

**dateutil** The [dateutil](#) library provides extensions to the standard datetime module

**EPS** Encapsulated Postscript ([EPS](#))

**FreeType** [FreeType](#) is a font rasterization library used by matplotlib which supports TrueType, Type 1, and OpenType fonts.

**GDK** The Gimp Drawing Kit for GTK+

**GTK** The GIMP Toolkit ([GTK](#)) graphical user interface library

**JPG** The Joint Photographic Experts Group ([JPEG](#)) compression method and file format for photographic images

**numpy** [numpy](#) is the standard numerical array library for python, the successor to Numeric and numarray. numpy provides fast operations for homogeneous data sets and common mathematical operations like correlations, standard deviation, fourier transforms, and convolutions.

**PDF** Adobe's Portable Document Format ([PDF](#))

**PNG** Portable Network Graphics ([PNG](#)), a raster graphics format that employs lossless data compression which is more suitable for line art than the lossy jpg format. Unlike the gif format, png is not encumbered by requirements for a patent license.

**PS** Postscript ([PS](#)) is a vector graphics ASCII text language widely used in printers and publishing. Postscript was developed by adobe systems and is starting to show its age: for example it does not have an alpha channel. PDF was designed in part as a next-generation document format to replace postscript

**pgi** [pgi](#) exists as a relatively new Python wrapper to GTK3 and acts as a pure python alternative to PyGObject. [pgi](#) still exists in its infancy, currently missing many features of PyGObject. However Matplotlib does not use any of these missing features.

**PyGObject** [PyGObject](#) provides Python wrappers for the [GTK](#) widgets library

**pyqt** [pyqt](#) provides python wrappers for the [Qt](#) widgets library and is required by the matplotlib Qt5Agg and Qt4Agg backends. Widely used on linux and windows; many linux distributions package this as 'python-qt5' or 'python-qt4'.

**python** [python](#) is an object oriented interpreted language widely used for scripting, application development, web application servers, scientific computing and more.

**Qt** [Qt](#) is a cross-platform application framework for desktop and embedded development.

**Qt4** [Qt4](#) is the previous, but most widely used, version of Qt cross-platform application framework for desktop and embedded development.

**Qt5** [Qt5](#) is the current version of Qt cross-platform application framework for desktop and embedded development.

**raster graphics** [Raster graphics](#), or bitmaps, represent an image as an array of pixels which is resolution dependent. Raster graphics are generally most practical for photo-realistic images, but do not scale easily without loss of quality.

**SVG** The Scalable Vector Graphics format ([SVG](#)). An XML based vector graphics format supported by many web browsers.

**TIFF** Tagged Image File Format (**TIFF**) is a file format for storing images, including photographs and line art.

**Tk** **Tk** is a graphical user interface for Tcl and many other dynamic languages. It can produce rich, native applications that run unchanged across Windows, Mac OS X, Linux and more.

**vector graphics** **vector graphics** use geometrical primitives based upon mathematical equations to represent images in computer graphics. Primitives can include points, lines, curves, and shapes or polygons. Vector graphics are scalable, which means that they can be resized without suffering from issues related to inherent resolution like are seen in raster graphics. Vector graphics are generally most practical for typesetting and graphic design applications.

**wxpython** **wxpython** provides python wrappers for the *wxWidgets* library for use with the WX and WXAgg backends. Widely used on linux, OS-X and windows, it is often packaged by linux distributions as 'python-wxgtk'

**wxWidgets** **WX** is cross-platform GUI and tools library for GTK, MS Windows, and MacOS. It uses native widgets for each operating system, so applications will have the look-and-feel that users on that operating system expect.
